Among the many methods promulgated for the relief of the operatives of Lancashire during the period of distress was that which was known as the emigration movement. Thousands of men, who had never before thought of quitting the land in which they had been born, were induced to accept offers which promised work and wages, if they would but cross the seas to more thinly-peopled countries. The emigration fever was never popular with those who cared most for the welfare of the poor. It was seen that the emigrant who was most likely to succeed in a new country, was the man who by his own energy and frugality had saved the means to carry him to his destination, and to make the sufficient, though rough home, with which he purposed starting in his fresh race after wealth and happiness; independent, and having thoroughly thought out what his new life was likely to be, prepared for its discomforts and hardships, he looks to his labour, backed by his little capital, to carry him through. Unfortunately, very many of the recent Lancashire emigrants were not of this character. In all things they were dependent. For the clothing they wore—for the means enabling them to reach the seaport whence the vessel was to sail—for their passage over the sea, they were dependent; when they landed, they were dependent, and, to a large extent, at the mercy of those who had charge of them. This utter dependence was sure to have considerable influence upon their character. Their friends at home watched their departure with sad forebodings, and they themselves, in many instances, could but see that they were jumping from a large to a greater evil. There was not much heart in their emigration. It was whilst this depopulation of Lancashire was going on that a local poet, using that dialect which Edwin Waugh and Benjamin Brierley had made so popular with the poor, essayed to put into rhyme the feelings of a sad old woman, whose son, with his wife and family, had gone off to Queensland. First, there was the farewell. The garrulous grandmother finds it especially hard to part with her grandchildren. Whatever else they may find in their new home, there will be no one to care for them as she would. Her notions of the far-off land, its flowers, its birds, and its sky, are odd, no doubt. She has heard something of how Christmas and Midsummer come together, and is puzzled. Looking at her little toddling pets, she says:—

"Ther'll nob'dy get yo daisies then,
Nor bonny blue bells poo, aw'm sure;
Nor make yo posy wreaths agen,
Nor twine wild roses int' yoar yure.
Ther'll nob'dy tak yo into th' clooff,
An' let yo romp an' marlock theer;
An' when yo'n fairly play'd enoof,
Ull teighl an' hug yo back, eh dear!

"Yo'll ne'er find swallows uppo th' wing,
Nor see th' three lucky pynarts fly;
Nor hearken th' bonny layrock sing,—
A dark spot ditherin i' th' blue sky.
Eawr pratty stars yo'll never see,
Aw amno sure yo'll see th' same moon;
Things mun be wrong, it seems to me,
Wheer th' winther days throng into June."

The emigrants go; month after month passes, and the old folks at home long for some news of the absent. At length a letter comes. It is as cheerful as can be expected, but does not satisfy. Time still passes on, and one stormy night, when the lightning flashes and the thunder roars, and the rain comes down in torrents, the poor old woman quakes with terror. She looks out at the door, sees how the rain rushes down, starts back at the vivid flash which reveals all the desolateness outside, and then turns in to ruminate. Involuntarily her thoughts fly off to those away, and she fancies all sorts of evil happening to them. Even in bed her dreams are of them. Next day she tells her dream to her old husband:—

"Aw've seen em i' their Queensland whoam,
As plain as e'er aw seed em here;
Th' place may be reet enoof for some,
Bo Will ull find no comfort theer.
Aw seed em i' their wooden hut;
They didno seem o' eare t' be free,
For Peg an' Will to bed wur put,
An' Polly sat o' th' mother's knee;

"An' th' mother keawrt o' th' stoo i' th' nook;
Hoo'r sadly autthert, too, for sure;
Will wore a weary, wasted look,
As he walkt to an' fro o'er th' floore.
At th' yead o' th' heawse, aw'r fain to see't,
Eawr pictbers hung; an' plain t' be seen,
Ther Polly's mother's hung o' th' reet,
An mine o' th' left, an' thine between.

"An' while aw closely watcht eawr lad,
He stopt before em neaw and then,
Lookt o'er em one by one so sad,
Then soikt an' walkt abeawt agen."

These rhymes do but embody the fancies of Mr. Joseph Ramsbottom. But that his fancies were not extravagant ones we have evidence to show. Papers recently received from Queensland tell a story which will touch many hearts in Lancashire. Three or four years ago a number of working men, residing in and about Bolton, formed themselves into a company, and, having raised some little money, sent out about thirty men to found a cotton-growing settlement in Queensland. It was intended that these thirty should prepare the way for others. It is said that some pods of Sea Island cotton, picked from trees in the Brisbane Botanic Garden, had been handed about amongst these men, and that their imaginations had been inflamed with the thought of what might be done. Numbers of men who were then suffering from the general complaint —want of work—went without meals which they could ill spare that they might contribute something to the fund which should convey themselves or their friends to a new land of promise. Land was taken up on the Pimpama River, and after three years' hard work, hard fare, and innumerable privations on the part of the men, the scheme has failed utterly, the manager has been obliged to sell the land for any price he could get, to meet the liabilities on the estate, and the men are all at loggerheads with him, and suing him for wages for the time they have been at work on the company's estate. When Mr. Lee, the manager, took up the land on the Pimpama, he found that the rules of the company at home were not applicable to a company in Queensland; so a new company was formed, but no articles of association were signed by the men, although they were shareholders of the home company, who had been drafted off, or who elected to come to Queensland. As they came out, Mr. Lee received them, and took them down to Pimpama, where they seem to have all worked and fared very much alike. The land orders they brought over were handed to the manager, and he disposed of them for the purpose of purchasing stores and other necessaries. An £18 land order would realise £14 10s. among the Brisbane speculators; so each man who had a land order was credited with a half paid-up share of £25 in the Queensland Company. When land orders to emigrants ceased to be transferable, the men were told that they would have to work out a share. But things grew worse and worse at Pimpama, and some of the men began to leave; so, to prevent this, and make another effort to render the undertaking a success, it was decided that each man should sign a formal agreement with the manager under the Queensland Masters and Servants Act, by which they undertook to serve him for six months at stated wages and rations; at the same time, according to the statement of the manager, it was agreed that these documents should not bear a literal interpretation, but that each workman or shareholder on the estate should take a fair share of the proceeds from the estate. The new arrangement worked no better than the old, and at length Mr. Lee (the shareholders say without the knowledge or consent of them, or his fellow-directors) sold the estate, and two of the men sued him in the Supreme Court recently on the argument for wages to which we have before alluded. The jury, with characteristic impartiality, gave a verdict for the plaintiff in one case, and for the defendant in the other.

The Temperance Question in its Sanitary Aspects.

From the Latin *sanitas* comes our "sanitary," signifying "that which pertains to the health or soundness of the body." Health is so great a blessing, that we are not surprised to learn that the Greeks, who were addicted to deifying things visible and invisible, should have worshipped it as a divinity. To all classes and to all men health is a boon exceedingly precious, though not sufficiently prized by many, as the proverb tells us, till it is lost. But to working men, beyond the enjoyment it yields to all, it has an especial value, as the physical condition on which their labour, and the pecuniary reward of that labour, depend. A mechanic or artisan cannot afford to do his work by proxy. Weakened health means to the manual toiler weakened capacity of support; and want of health, when long continued, is but another name for want of those comforts, and even necessaries, which help to make sickness more endurable. Provident habits will enable the workman to provide for a rainy day, but they will never enable him to dispense with the health and strength, whose industrial application brings to him and his family the earnings that are partly consumed and partly stored.

If, as was before shown, distilled and fermented liquors contain scarcely the smallest alimentary substance, any sanitary quality they may possess must be related to the alcohol which gives them their intoxicating power. Experiments, however, have demonstrated that in large doses alcohol acts characteristically as a poison; and every test hitherto applied has made it appear that some of the effects of poisonous doses attach to quantities very commonly consumed as daily potations of alcoholic liquor. Small doses often repeated, exert, it is found, though more slowly, some of the worst effects of large doses; and where any effect at all can be traced on the composition of the blood, as viewed under the microscope, it is injurious rather than beneficial. Alcohol is never assimilated—that is, it never becomes a part of the body; and a course of most interesting experiments entered upon by eminent French chemists, and confirmed by English experimenters, has made it clear that as soon as alcohol enters the system the excretory organs are set in motion to expel it. This fact is a strong presumption against the sanitary influence of alcoholic drinks; and the amount of extra labour thus thrown upon the excretory organs cannot be without some disadvantage to them when the amount of such labour, extending through many years, is taken into account.

Drunkenness is admittedly an anti-sanitary condition; but drunkenness is a very indefinite state, and is generally identified with marked intoxication; yet the truth is that very much of convivial drinking is responsible for consequences injurious to health that are popularly restricted to glaring inebriation. Every medical practitioner knows that multitudes who are not drunkards, in the popular sense, use strong drink so as to injure themselves and abridge their lives. The great risk to health that attends drinking as a social practice and as a sign of good fellowship, is not to be lightly regarded.

When the Temperance advocate urges that entire abstinence from all alcoholic beverages would cause a sanitary no less than a sober reformation, he is entitled to be heard with respect. So many lives are destroyed and so many constitutions broken up through drinking, that the philanthropist cannot be prejudiced against a system that would, at all events, save thousands from premature decay and death every year. What excessive drinking can bring men to—many of them workmen of no mean abilities—the infirmaries, and hospitals, and cemeteries of the country too fearfully attest. That total abstinence, if universally practised, could entail an equal loss of life, is utterly incredible. But, as compared with a moderate use of intoxicating drinks, is total abstinence a sanitary regulation?

Besides the scientific argument already noted, other facts may be adduced.

1. The experiences of prison-life are of unquestionable importance. In prisons, where men of all characters—some moderate drinkers, others very immoderate—are brought together, sudden abstinence becomes the rule binding upon all. The results are, with the rarest excep-

tions, in favour of the prisoners' health; and one governor of a prison for twenty years has stated that out of 20,000 persons confined, he never knew a single instance of suffering from this cause.

As voluntary abstinence cannot be more prejudicial than compulsory abstinence, this test cannot be accused of unfairness, and it is not open to the charge of partiality in numerical limitation.

2. It is demonstrable that in extreme temperatures of heat or cold, abstinence is preferable to any use of alcoholic drinks. In Arctic regions alcohol cannot be used with impunity; and in hot climates its worst effects are rapidly displayed. An official statistical return in relation to British soldiers in India, showed that the mortality among drunkards was twice that of moderate drinkers, and among moderate drinkers twice that of total abstainers. Failing in extreme temperatures, can it be supposed that in more temperate climates alcoholic liquors are capable of imparting energy to the frame?

3. Long before the Temperance movement commenced, it had been proved that the hardest labour could be better sustained without intoxicating liquors than with them. Even among non-abstainers, many who are engaged in the most exhausting callings—such as working before blazing furnaces, and in deep mines—never drink strong liquor till after their daily toil. It may be stated as incontrovertible, that the most laborious manual labour in Great Britain is now performed by abstainers with less fatigue than by others. The sanitary indications of this fact are too plain to be mistaken.

4. The statistics of sick and benefit clubs—whether the comparison is made between abstainers and others in the same clubs, or between clubs of abstainers and other clubs—generally, if not uniformly, sustain the Temperance position. Insurance offices admit as much by their anxiety to secure teetotalers as members, some of them grouping such insurers in a separate section. But the most important evidence yet furnished of a statistical nature is derived from the experience of the General Temperance Provident Institution. During its first ten years (1840—50) this office insured abstainers only, and the rate of mortality was considerably below the average of other offices. Subsequently, non-abstainers were insured in a separate section, and this arrangement has allowed of a close comparison, extending over fifteen years, of both classes, every care being taken, in the case of non-abstainers, to accept only those who were of strictly sober habits. Two bonuses have been declared during the terms of comparison, and we learn that the abstainers obtained bonuses ranging from 35 to 75 per cent., and from 35 to 86 per cent., while the bonuses realised by the non-abstaining section ranged from 23 to 50 per cent., and from 24 to 59 per cent. The actuary who certified to these differences was himself a non-abstainer, the late Mr. Peter Hardy.

All these considerations, separate and collective, are entitled to great weight; but they do not stand alone. It would be incorrect to represent the sanitary case of the Temperance reformer as confined to the bare issue, whether any use of intoxicating liquor is better for the body than none. The friends of Temperance associations are, as a rule, fully alive to the importance of all the sanitary appliances and aids involved in good lodging, good food, and good clothing. They acknowledge that incalculable sanitary benefits would flow from successful efforts to multiply the improved arrangements just described; but they also insist upon it, and with great force, that were their recommendation adopted, all these means of promoting sanitary reform would be powerfully reinforced. They urge that, if the working classes would cease to drink, this single act of abstention would speed the cause of sanitary improvement as nothing else can do.

New Gold Mines.—A number of Californian miners have emigrated to Choco and Barbacoas, about 500 miles south of Panama, to work the gold mines there.—*California Paper.*

New Park for Southwark.—At the last monthly meeting of the Rotherhithe Vestry, it was stated that the Metropolitan Board of Works had now obtained possession of the whole of the land required for the formation of the new Southwark park, and the work of clearing some of the market gardens had been commenced. Some tenements required would be given up to the board after Lady-day, and the work would then be rapidly proceeded with.

The Scotch Herring Fisheries.

It may be well to mention that the Scotch people paid very little attention to the herring fishing about the commencement of the present century; but it was prosecuted with vigour for several centuries by the Dutch, who employed at one time no less than 1,800 or 1,900 boats, each on an average of about 50 tons, and manned by 25 men. The employment of from 40,000 to 50,000 in this manner, and the families depending upon them, was a matter of very great importance. The Scotch people became alive to the importance of the fishery about 1820; and being stimulated by their successful efforts, have carried it on since that period with the greatest perseverance into its present developed form. A Board of Fisheries has been instituted, and is in operation, for their proper management and prosecution.

The herring fishing is of national importance, especially when we take into consideration the number of people who gain their livelihood in its prosecution. The dangers to which fishermen are exposed are very hazardous indeed. The greatest number of boats are without any decks; and when a storm arises they have, on account of their great number, great difficulty in running clear of one another. During the year ending 31st December, 1864, there were no less than 13,331 boats, decked and undecked, employed in the capture of herring, cod, and ling, in Scotland and the Isle of Man, manned by about 43,484 fishermen and boys; the tonnage of the whole being 98,522 tons.

Each boat in the herring fishery is manned by four or five, and occasionally six men. On the eastern coasts of Scotland one man is generally the owner of the boat, sometimes two; but on the western coast there are usually three or four, who run shares: but the owners employ "hired men," as they are termed, to form their respective crews. The value of a good boat, when new, is about £100, and the nets and other materials required will amount to nearly another £100; so that it will be observed that the fisherman requires a considerable capital ere he can equip himself properly, and free of debt, for the sea. Besides, his resources, being always exposed to the mercy of the elements, are very precarious. Fishermen might avail themselves of the advantages afforded by insurance companies, which have been, so far as we are aware, hitherto entirely neglected by them.

We can scarcely behold a more beautiful sight in an autumn evening than the Moray Frith studded with boats, sailing away to shot their nets for the finny tribes of the deep; and our admiration is transformed into astonishment when we are informed of the real value of property that is committed to the deep, besides the great number of precious lives that are entrusted to its bosom. A few statistics will, we presume, be exceedingly interesting. The area of the Wick fishing ground is about 150 square miles. All the nets which belong to a boat are called its "drift," and the drift is usually about a mile in length. Allowing, then, a mile, or at least two-thirds of a mile, for a drift of each one of the 1,030 boats that hails from the port of Wick, taking the lowest calculation, and the whole length will at least be about 800 or 900 miles. We can hardly imagine the havoc which such an amount of netting would perform amongst great shoals of fish in the above-mentioned area. The value of only the boats, nets, and lines, engaged in the herring, cod, and ling fisheries in Scotland, including the Isle of Man, amounts to about £875,000.

The herring fishing on the western coast extends over five or six weeks in the months of May and June; on the eastern, for seven or eight weeks, in July, August, and the first few days of September. These are the particular periods in which the fish appear in great bodies off the coasts, but they can be procured all the year round in greatly reduced numbers.

The fishermen enter into engagements with curers to deliver their "catch" at so much per cran. Sometimes they do not make such agreements, but sell their fish at the prices that may be current at the time of delivery. But the general rule at the great fishing ports, such as Wick, is to deliver them to curers at so much per cran. About 700 herrings are required on an average to fill a cran measure. Some boats may capture 200 or 300 crans during a fishing season, which consists of seven weeks; but it is at best nothing but a game of chance, and other boats may be even limited to 20 or 30. The prices vary from year to year, but on an average for the last few years it may be estimated at about 20s. per cran. It will thus be seen that the fisherman who may be to any great extent successful, is highly remunerated for his toil during the few weeks he is so employed. The fishermen are generally the owners of the boats, and the hands employed by them for their assistance in the management of the boat and in fishing get from £4 to £9 as wages, according to their merits as seamen, for a season. The town of Wick is the great metropolis of the herring; and at the commencement of each fishing, great numbers of men from the immediate counties collect, in order that they may be employed as hired men during the season. They flock from Sutherlandshire, Ross-shire, Inverness-shire, Orkney and Shetland, &c., and on the expiry of the term of their engagements, carry away their earnings to their respective homes.

The result of each fishing brings either joy or sorrow. Sometimes the fisherman has from £60 to £150 clear in his pockets; and at other times considerably in debt. But although his efforts be fruitless one year, he always expects to be successful the next. In fact, there are two fishings in the same year—one on the western coast, and the other on the eastern, at two different periods, so that the fisherman of either coast can avail himself of both. A great number embrace this opportunity, with all its uncertainties; and, like every other professional department of social economy, some are successful, others are not.

Along the eastern coasts of Sutherland, Ross-shire, Caithness, as well as on the entire western coast, the fishermen have small farms or crofts, on the cultivation of which they spend the time in which they are disengaged from fishing. On the shores of the Firth of Forth, and the southern shores of the Moray Frith, the case is entirely different. There the fishermen do nothing but fish from one end of the year to the other. No sooner does one race of fish go out of its season than they are capturing another in season. When the great shoals of herrings move away from the coast, they ply the white fishing, such as cod, ling, and haddock; hence the whole period of their existence is occupied in the prosecution of the various kinds of fishing; and many of them have more than enough to do to maintain their families. The number of fishermen is comparatively small in comparison to those who are dependent upon them. Of the 43,484 fishermen in last year's report of the commissioners of the British fisheries, there are 40,934 of these in Scotland, and 2,550 in the Isle of Man. The number of those who are thus placed in immediate dependence upon the fisheries is therefore very great. The Royal Naval Coast Volunteers in Scotland are all from the ranks of the fishermen.

The social position of the fisherman has, like that of every other class in the kingdom, risen gradually—from physical, social, and moral points of view—within the last thirty or forty years. The habits of the Lowland fishermen are cleanly and industrious, and their brethren from the Highlands are learning lessons of great benefit for the promotion of social principles during their annual sojourn among the great fishing towns. No great change can be expected to take place at once. This intercourse, which is the result of the successful prosecution of the herring, will have a great tendency to mingle the Saxon with the Celt. It incites a kindly feeling in the breast of the one to the other. Complaints were made at one time that they were too much given to intoxication; yet, we must confess that this custom is still rather prevalent; but, at the same time, we are quite convinced that its influence has greatly diminished. Not many years ago, not one of their boats could be hauled or launched, not even a bargain contracted, without being terminated by some Bacchanalian festival. Such practices have, however, changed for the better. We anticipate that there will yet be greater reforms in the fisherman's social position, so that his influence as a member of the community may be considerably enhanced, as well as his own individual comfort and prosperity greatly increased.

(*To be continued.*)

The Ster-Hydraulic Press.

It was not until the year 1796 that Bramah applied the principle of equality of pressure in fluids, discovered by Pascal, and constructed the hydraulic press that bears his name, and which has rendered such important services to arts and manufactures.

It is, however, very probable that Pascal invented several machines based upon the power of water; and Condorcet, who published his works in 1776, warmly regrets his inability to obtain a copy of the collection of machines published by Pascal, but of which only thirty copies were printed. The first idea of applying the force of water to the increase of power in presses unquestionably belongs to Pascal; and it is to be remarked that, in the description of the principle he had discovered, the hydraulic press is not given in the germ, but actually constructed in all its parts. This fact may be proved by reference to the second edition of Pascal's works, published in 1664, in which he says:—"If a vessel full of water, closed on every side, has two openings, one a hundred times larger than the other, by putting into each a piston that exactly fits it, a man, pushing the smaller piston, will match the power of a hundred men who push the one which is a hundred times larger. . . . Whatever proportions these openings may have, if the power applied to the pistons is equal to the openings, they will be in equilibrium, from which it appears that a vessel full of water is a new principle in mechanics, and a new machine to multiply power to any degree that may be desired, as by this means a man may raise any weight he proposes."

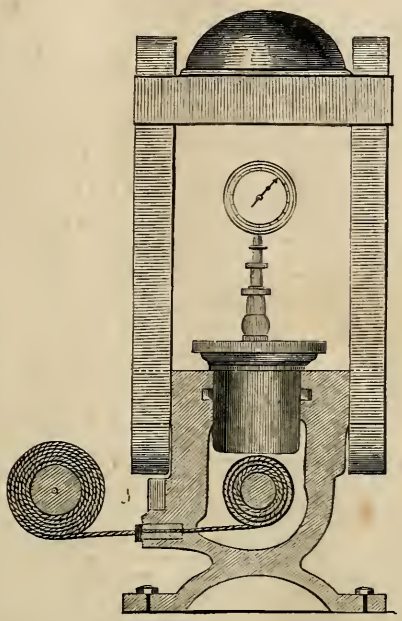
The invention of the hydraulic press, a powerful aid to mechanical industry, did not cause lever and screw presses of iron and wood to be superseded. These various kinds of presses continued very imperfect in their construction up to the year 1815, but since that date they have undergone so many improvements that it would be impossible to enumerate them. In the minor branches of manufacture they are still employed; but, notwithstanding the various modifications they have undergone, they still remain very defective, are easily put out of order, and very slow and uncertain in their results.

Messrs. Desgoffe and Olivier have endeavoured to remedy the inconveniences inherent to presses of this class, and have sought to provide small manufacturers with a simple, durable, and powerful machine. They have succeeded admirably. The principle upon which their apparatus is based is of a simplicity so elementary that we naturally inquire how it happened that it was not sooner thought of and applied.

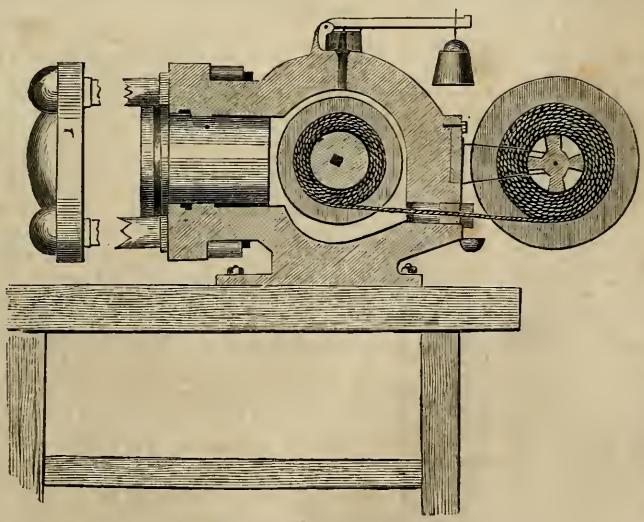
Introduce a cord into a vessel full of water; the liquid is displaced and overflows. Substitute an hermetically closed vessel for this open one, and cause this same cord to penetrate into it by a closely-fitting aperture; the liquid will be displaced as in the first instance, but, being unable to flow out, it will be compressed, and in virtue of its elastic force will be pressed against the sides of the vessel; if one of these sides is formed by the surface of a piston, the latter will be pushed by the pressure exercised by the liquid, and, being raised, will exercise upon the substance between its external part and the platten of the frame an action analogous to that of the piston of the hydraulic press.

In the hydraulic press, the pressure is exercised upon the surface of the liquid, and is communicated to every portion of it. In the new press, the compression of the liquid is effected by means of a solid body, which, introduced into the mass, diminishes the space occupied by the liquid, and compels the same quantity of matter to assume a smaller volume. Thus, the ster-hydraulic press is based upon the well-known principles, observed during all time, of the compressibility and elasticity of fluids.

This being established, we now proceed to show the ingenious arrangements the inventors have contrived for their apparatus, or solid hydraulic machine (from *stereos*, solid). First, there is an external pulley, upon which a cord is wound, which passes through a stuffing-box to be wound upon a pulley placed in the interior of a receiver, which contains the piston rod. This receiver is full of liquid; the cord by being wound upon the internal pulley displaces the liquid, and forces the piston outwards; by exercising upon the latter an action energetic in proportion to the quantity of cord wound, the capacity of the receiver diminishes, and, consequently, compels the liquid to assume a smaller volume.



VERTICAL STER-HYDRAULIC PRESS.



HORIZONTAL STER-HYDRAULIC PRESS.

By operating in a reverse direction—that is, by winding the cord upon the external pulley, and by unwinding the internal pulley—a vacuum equivalent to the volume of the length of cord unwound is produced in the receiver, and the piston then returns, driven by atmospheric pressure—provided its weight and the friction are not too great—the pressure of the liquid on the piston ceases, and is thus brought to a state of inactivity. Oil is the liquid employed to fill the receiver, and the solid body selected is catgut, which, by its unchangeability in oil, and by its malleability, admits of ready winding power, and presents a perfect resistance to the efforts of traction and compression. The joints of the piston and of the axis of the internal pulley are made of leather; that of the cord is made simply of hemp. At first sight, it may appear very difficult to avoid leaks at the latter joint; but several months' experience has proved that it was completely staunch; for the cord enters the receiver with very great velocity, and in a direction opposite to the motion of the liquid which tends to flow out; the cord thus carries with it small quantities of oil, which the internal pressure impels to escape, and, consequently, opposes all leakage of the liquid. By the contact of the oil, the stuffing-box around the cord becomes more and more condensed, and at length forms a horny tube of the exact calibre of the cord.

This new press is constructed for vertical and horizontal positions, by varying the arrangement of the pulleys and the winding of the cord; but it is not necessary to enter into all the details of construction, but only to point out the advantages of this new press.

The nature of this apparatus does not admit of its replacing powerful hydraulic presses, for that would require cumbersome lengths of cord and immense receivers. The ster-hydraulic press is proposed to supply the place of the ordinary screw and lever press, and produce a pressure equal to fifty tons, which is sufficient for most manufacturing purposes. By suppressing the causes of derangement in ordinary presses, and by creating apparatus for continuous pressure—so necessary, for instance, in the manufacture of oils, in which the gradual pressure of the screw press is considered better than the sudden fits and starts of the hydraulic press—by substituting for the parts more or less complicated of common presses a simple arrangement which admits of a durable machine being sold at a low price, and by its easy working and a certain readiness for use, Messrs. Desgoffe and Olivier have rendered important service to industry. It is not improbable that the idea embodied in the ster-hydraulic press will receive other important applications.

Off a Board.

A TAILOR'S STORY.

"You'd better pay it," says Jenny.

"I'll be hanged if I do!" I says.

"Don't be obstinate, Dick," says Jenny; "it will only make worse of it."

"*I won't pay it!*" I says, savagely; and I banged my iron down upon the old horse-shoe that I use for a stand, and that so fiercely, that Jenny, my wife, jumped again.

"But, you know, they'll put in execution, and drag off ever so many things, Dick; and you wouldn't like that, I know."

Ah! and so I did know; but I'd had all my fur rubbed up wrong way, and I wasn't going to own it. So, like a many more fools do when they're cross, I shut my eyes to reason, and I says—

"They may take every blessed stick there is in the room, and be hanged to 'em, for I don't care!"

I felt sorry as soon as I'd said it; but I wasn't going to show it, 'cause I thought it would look weak; but I took a peep out o' the corner o' my

eye at Jenny, who was watering the flowers in the winder—for we always has a few in the summer time, though we can't keep 'em free from blacks, and they gradually gets a bit worse every day from the time we buys 'em in Common Garden till they dies right off, as if they pined away, like some other little flower did, amongst the bricks and mortar. So I looks out o' the corner o' my eye at Jenny, and I sees she was troubled about it; for though she made believe to be werry busy watering the little fairy rose with the old broken-nosed tea-pot, I saw one little drop o' rain from somewheres else fall upon the flower, while them three seams—the worst I ever sewed, and I own it, I did sew them—them three seams were marked out deep in Jenny's forehead as she stood there in the winder.

Now, you know, that one little round drop bowled me over like a nine-pin, without the three seams, or the sight o' the little rose-tree. I drops the trouser-leg I was on, uncrosses my own quietly, and should have been off the board and behind her before she knew it, if I hadn't clapped my hand on my goose, which, being hot, bit me sharpish, so that I made a noise. Howsomever, I gets off the board, and gets alongside o' Jenny, and——

"I'll pay it, Jenny," I says.

"I knew you would, Dick," says she; "but you shouldn't turn so cross." And them three seams were gone in no time, and the place looked quite sunny again as I slipped back on to the board and stitched away like a good un.

"Where's my twist?" I says.

"Why, you had it there just now," says Jenny. "Why, you're sitting on it."

So I was. But then the wax was lost; and after a hunt I found I'd knocked it down; and then the iron was cold; and one way and the other, all along of that blessed little score, I'd lost two hours that morning. Then comes two rings at the second bell, which means first floor back—that's us, one ring meaning first floor front—and Jenny goes down and finds it's the trotter, as we calls the errand-boy from the shop; and there's all the fat in the fire—regular flare-up because the trousers ain't done.

"Tell him I'll bring 'em the moment they're done," I says. And then I begins to feel that mad again I didn't know what to do, till I sees the seams coming in Jenny's forehead as she sits down to help me, when I swallers it all down, rattles away at the job, nips on the buttons, presses off with a good iron as Jenny had ready; and there they were, as well-made and good-sitting a pair o' trousers as could be turned out by any trouser-hand in all town.

Now, I don't go by looks when I say they're well done; and I don't go by what our foreman says when I take my work to the shop. I don't go by that, for our cutter grumbles at everything as goes in; but I'll tell you what I goes by, and that's this—there's always another pair cut out ready for me, so that I'm mostly in full work, and the missus and me can earn in a week—what aint nobody else's business but our own.

Dinner was ready when I got back from the shop: the bit o' steak looking as brown as brown; plenty o' gravy—I wouldn't give a shred for my dinner without gravy; Jenny was peeling the potatoes—beauties they were, too, laughing all over in their brown jackets till they cracked their sides; there was a pint o' heady porter winking and twinkling in the jug; and all looking as clean, and neat, and nice as could be. But, as I told you, I didn't feel smooth, and I bangs the cloth down on the board so that the scissors jumped again; rattled my hat up again the canary-bird's cage, and nearly frightened the poor little yaller thing into fits; and went on a bit like those chaps do on the stage when they're in a passion.

Jenny wasn't going to be done in that way though, bless you! for she gets hold of me with one hand, holding a potato on the end of her fork in the other, just as if she was taking me into custody, and then shoves me into a chair by the table.

"Can't eat," I says; "I'm off my feed."

"Nonsense, dear," she says; and a pretty dear I looked, I know.

"No appetite," I says.

"Nonsense," she says; "that's as juicy and tender a bit o' steak as can be got for love or money."

"Yes," I says; "and that blessed County Court bailiff 'll be here directly for that money."

"No, he won't," she says. "He's been, and I've paid him."

"You have?" I says, splashing the gravy all over the clean cloth.

"Yes," she says. "I took enough out o' the post-office on purpose; and now that's done with, and I won't have another word said about it."

And then she poured me out a glass o' beer, frothing it up well, and as soon as the canary heard it trickling into the glass, he burst out a-singing, and what with the steak being so tender and juicy, and spiced up with a pickled walnut in the gravy, and the potatoes melting away like balls of flour in one's mouth, and the beer being cool, and nice, and sharp; and last and best of all, my Jenny sitting there so quiet and comfortable-looking, I made one o' the best dinners I ever did in my life, and went to work after with a load off my mind, and felt better than I had done for days.

And now, along o' that score, speaking as fair as a man can speak, it was a burning shame as I had it to pay. You know it aint pleasant to be made to pay for things as you never had; and I know I never had one half o' the beer o' Saturday nights as that landlord sent me in a bill for.

"No," I says; "I'll pay you what's right and just, and I won't pay another penny." And so he puts it in the County Court.

Jenny was werry cross about it, for she said I'd no business to have run up a score, and that I might have been sure of what would foller; and after what I'd promised, she said it was too bad.

I didn't say so, but o' course she was right; and in spite o' good advice to pay the thing and adone with it, I must be obstinate, and talk about principle, and so on, and lose a day's work to go and dispute the claim. Nice fool I made of myself! The plaintiff gets up in the box, and is sworn, shows his books; and then comes my turn, and of course I swears I didn't owe so much, for I knowed I owed something.

"How much of it do you dispute?" says the judge.

"Well, I don't exactly know," I says; "but I don't owe all that, your honour."

"Have you kept any account?" says the judge.

"No," I says, "I haven't, your honour."

"You ought to be ashamed of yourself," says the judge. "You get into this man's debt for beer, when the money that will have to pay for it is wanted for your own home. And as for the plaintiff, he deserves to lose it all, for landlords have no business to let men run up these Saturday night scores. Order for immediate payment!"

O' course, I looked like a fool, and I know everybody in court thought so too; and there was judgment entered against me, and I should have to pay the bill, and the cost of the summons, and the hearing fees, and then on to that was the loss of a day's work; so that I went home calculating that it would just about swallow up a pound of the five-and-thirty shillings we had got in the post-office savings bank; and after growling away all that evening, and drinking more beer than was good for me, I was headachy and cross next morning, and swore I'd be hanged if I'd pay the money.

Now, two or three times over you've heard me talk about seams, and about three marks as I calls seams which I can see sometimes on Jenny's forehead, that used to be as smooth and white—ah, and whiter, too!—than any lady's. Now, fairly speaking, I only made two o' these seams; and t'other one came o' something else.

You see I don't think I went on quite as I should at one time. I was never a regular drinker, but I used to be too foud o' company, and spent a good deal of time, and money, too, at the different public-houses about, so that somehow or other, by littles and littles, a good half of what ought to have gone towards making home comfortable was fooled away, and nobody a bit the better.

Then, Lord bless you! I must take to keeping a dawg, when I wasn't keeping my wife and child properly; and instead o' taking Jenny and the little one out for a walk now and then, I must take the dawg out, while those faces at home was getting whiter and whiter every day, for want of a little fresh air.

Dawgs are right enough in their way, and I aint agoin' to find fault about tame dumb animals; but what I say is as a man with a wife and child living in one middle-size room, and a little one, a man who brings up a dawg to live there too, don't act with common decency to his wife and child; and, not to put too fine a point upon it, is little better than a fool.

Well, that's saying as I was little better than a fool about that time. Just so; and between you and me and the post, as they say, I begin to think now that I was a werry little bit indeed better than a fool, and perhaps there was such a werry small shade o' difference that it would ha' taken a clever man to tell which was which.

Of course, I grew sour and morose, and found fault with everything; and one day I went off out, for I'd no work, and I took my dawg with me, as a matter of course, and went wandering about the streets, anywhere, nowhere, like, with my hands in my pockets, looking a nice, respectable sort of a chap—unshaved, dirty-booted, shabby, scampish, and finished off with a short black pipe stuck in my mouth. I've got that picter of my old self framed and glazed, and can take a look at it any time when I like, for it's close shut up in my brains; and I takes it out now and then, shakes my head, and puts it away again: and you know it's when something pulls hard wrong way as I does this, and it freshens me up, so that I go to work again like a savage.

But along o' my outing that day. It was quite dark when I was on my way home, and I was crossing one o' the big streets, when I hears a shout, and jumps forward just in time to save myself from being knocked down by a gentleman's carriage; and just at the same time I hears a yelp, and then the carriage drove on, and I finds as my dawg had been run over, and was as dead as a door nail.

How I did go on as I went back! so that you may guess I wasn't werry nice society for a sad woman when I got home.

"What's the matter with her?" I says, roughly—for Jenny had our little girl, Meggy, in her arms by the side o' the fire.

"I'm afraid she's werry, werry ill," says Jenny.

"Got a cold," I says; "put her to bed." But as I said so I looked at her little flushed face, and something seemed to strike me all at once that it was worse than a cold.

"I can't put her to bed," says Jenny, "for I've been obliged to nurse her ever since you went out, and I haven't got her bed ready."

Then I began to tremble, and went and kneeled down by the poor little thing as she lay with her eyes half open, breathing short and heavy; while there was quite a wheezing, rattling noise in her poor chest.

"Let me take her," I says, softly; but the little thing heard it, and she clung closer to her mother, and motioned me away; and then it was I looked up, and saw that two deep seams ran right across Jenny's forehead, and I knew how they came there, while now even my own little one turned from me, and I felt something come over me as I had not felt for a year or two.

"Come to father, Meggy," I said; and the child must have known there was a difference in my voice, for she turned round, stared at me a minute, and then put out her arms, and I took her; while I saw the tears come pouring out of Jenny's eyes, for, though she could stand harsh treatment, this change seemed so to overcome her that she stood looking piteously at me for a minute, and began sobbing bitterly.

I sat up with Meggy that night, and made Jenny go to bed; but it was a long time before she went to sleep, and then I could hear her moaning every now and then so pitifully, while more than once I found her eyes all wet with tears, and I knew who made them come. There, too, in the cot-bed lay Meggy with her little face burning as she tossed about, and grew so wild that soon she didn't know me when I spoke.

Jenny had given her some spirits o'nitre, and thought it would drive off the fever; but as the night wore on she, poor child, seemed to grow worse.

If ever a man gnawed his own heart, I did that night. I could see it all now, and knew what a vagabond I had been to them both. A good workman, I might have had comforts around them, while now as I sat there I knew that I must fetch the parish doctor, for I had not a shilling in the world. It would have been a brave man who could have talked to me as I talked to myself that night, for I was kneeling down by

that little innocent's bed, bitterly repenting of all the past, and praying for a better future.

I should think it was about four o'clock in the morning as I kneeled there watching that poor little feverish face, that all at once I started, for a white figure stole into the little room and kneeled down beside me; and I don't know whether hearts do talk to hearts or no, but Jenny seemed to understand all I meant and wanted her to know, without my having to humble myself and tell her, as I kneeled there with my face buried in her hands. And at last, when I thought that as I had been coward enough to treat her as I had done, I would be a man now and tell her of my sorrow, though it humbled me, for I felt as I ought to be humbled, and was beginning to speak, but—God bless her!—she put her lips to mine and would not hear a word, for she said she had nothing to forgive.

Next morning I had the doctor there as soon as I could get him, and he told me to go on to his place for medicine, and I did so; and when I wasn't watching by the poor child, I was running out, and trying from place to place for a job of work. But there wasn't such a thing to be got now, for most of the masters knew me, and how much dependence they could place in my promise; and so that night, quite worn-out and hungry, I sat down to watch by poor Meggy's bed, and dropped off fast asleep.

Jenny soon woke me up and took my place, and she watched that night; but I could not sleep, for it seemed as though something was gnawing at my heart, and telling me of what a scoundrel I had been.

And then a week slipped by, and all these sad troubles that were upon us night and day seem now to be mixed up together in a confused dream; but I can see plainly standing out, and always shall, a bare and miserable room, lit by a tallow candle, where a figure which looks like a pale shadow of my wife Jenny sits with a little death-stricken figure in her lap. There's a neighbour there, too, and a doctor putting on his hat and leaving the room, shaking his head, while it seems to be me as is asking him whether nothing else can be done.

And I can see, too, a man selling nearly the last scraps of his furniture to a broker, so that he may pay the sad duties to the dead.

And I can see a sad couple standing by the side of a grave in the cemetery, looking down for the last time at a little plain white coffin with eyes that can see beneath the lid, and fondly gaze upon the waxen, sleeping features of their little child, as she lies calmly there in her white robe, almost smiling in her sleep deep and breathless, for the bundle of violets upon her breast lay motionless and still.

And I can see that couple back in their cheerless bare home, looking at the little empty bed, hand in hand; and then their eyes meet, so that something glances from those eyes; and on the one side, from beneath three deep seams, it's love and tender forgiveness, and on the other energy and determination.

* * * * * *

There was a man once, a common journeyman tailor—a poor working man, who had a heart—a fond and loving heart; for God ne'er made one otherwise; we alter them—and this man's heart, somehow, got out of place; but he fought hard and long to get it back—fought against want, poverty, and a bad name, a hard, up-hill fight, often ready to give up, but brought back to his duty by the sight of three deep marks upon his wife's forehead—deep in sorrow, almost gone in joy. It was a long up-hill fight, and he's a long way from the top yet, for there's been many a slip. Flowers could be seen in that man's window, and, among others, a little damask rose—one of those tiny-blossomed plants—and that flower faded and died every winter, as died once another flower in that same room. That man's wife tended those flowers, and some of the rose-leaves lay in a scrap of paper, which held, as well, a long brown curl of fine silky hair. There was sadness there when the cold time came, and the rose-tree faded; but they knew that the spring would come again, and bring another, and with humble hearts they hoped that they might some day see the glorious spring wherein that other flower blossoms in heavenly beauty; for no earthly spring brought another flower like the one they laid in the cemetery. He was a sad man that, and, perhaps, a wiser; and that man was me.

"Jenny," I says, the other day, "I was obliged to take out the picter and have a look at that scamp; but I shut him up again, and felt ever so much better after."

And Jenny held up her hand, as she al...ys does when I talks about the past.

*Loss of Life in Towns.**

It is wise occasionally to look back upon the records of a by-gone age, and by a comparison of our present condition with that of our forefathers to measure the extent wherein we differ from them, either for good or ill.

In any consideration of the relative loss of life in the great aggregations of humanity which we call cities, it will be allowed that London has the right of precedence. Not only is she entitled to this as the metropolitan city, but because of the proud position she holds as the chief city of the world—whether we regard the number of her people, or the vast wealth and power of which she is the representative.

There is no lack of materials for a complete knowledge of the London of to-day, when the results of elaborate official inquiries into every particular which concerns the well-being of her community are everywhere diffused, through a medium which was unknown in earlier years. To arrive at any useful conclusion relative to the London of a remote period, so as to gauge the measure of our subsequent progress, we must make the best use of such imperfect data as are derivable from the quaint memoranda and speculations of men who may be justly called the pioneers of statistical science.

Just two hundred years ago, Captain John Graunt, a Fellow of that Royal Society which has since inscribed on its long roll the names of so many illustrious men of science, and a man curious about many problems of the mystery of human life, estimated the population of London to be about 460,000, or a fifteenth part of the people of all England and Wales; and he therefore reckoned the aggregate population of the country to be at that time about 6,500,000 of people, increasing at so slow a rate as only to double their number in 280 years, whilst the inhabitants of London would increase to twice their then number in 70 years. But Sir William Petty, writing about 20 years later—that is, in 1683—estimated the doubling period at 40 years in London, and 360 years in all England, at which rate by the year 1840 the population of the whole country would amount to 10,917,389, out of which number London would count for 10,718,880, leaving only some 200,000 people "to perform the tillage, pasturage, and other rural works necessary to be done without the said city. Wherefore," he adds, "*it is certain and necessary that the growth of the city must stop before the said year* 1840, and will be at its utmost height in the next preceding period, anno 1800, when the number of the city will be eight times its present number—viz., 5,359,000, and when (besides the said number) there will be 4,466,000 to perform the said necessary rural works."

A glance at the recently-published report of the Registrar-General on the health of London during the year 1865 reveals a striking illustration of the wonderful change which has transmuted the 460,000 men of London in 1661 into the 3,000,000 who swarm in this vast hive at the present day. The limit of time which Sir William Petty assigned to its growth has passed by twenty years and more, yet there is no sign of a period of stagnation having been reached, seeing that some 45,000 fresh recruits are added yearly to its already teeming multitudes.

It will be evident from the following figures that Graunt's estimate of the doubling period was much nearer the mark than that of Petty:—

Graunt's Estimate of the Population in				1661, 460,000
Petty's	"	"	"	1683, 670,000
Maitland's	"	"	"	1738, 725,900

But from various considerations it is clear that such estimates, founded as they were merely upon observations of the christenings and burials, were only the merest guess-work, and it is therefore little to be wondered at that there was so large a margin of error. The reproductive force of our race, which seemed to be almost declining in the eighteenth century, has been amply restored in the nineteenth, and the English people have doubled their numbers in the last fifty years; whilst, by a strange coincidence, the doubling period for London is found now to agree almost exactly with the time specified by Petty, namely, forty years. So that we may regard our future prospects with equanimity, seeing that the rapid increase in our chief city is in so large a degree balanced by corresponding additions in other parts of the country.

Graunt had undoubted evidence that the burials exceeded the christenings, and he concluded, therefore, that if the population increased at all it could only be by the "transplantation" of considerable numbers from the country. The increase from this source he estimated at about 6,000 per annum. Taking the last few years, we find that, according to the ascertained rate of increase, about 45,000 persons are now added yearly to the population of London, whilst the annual excess of births over deaths averages only 30,000; and as a necessary consequence, therefore, the remaining 15,000 must be supplied from other sources, a large proportion of them, no doubt, coming from the country, but many also from foreign lands, or less prosperous parts of Her Majesty's dominions.

Very many of Graunt's statements are useless for comparative purposes, in some cases on account of the impossibility of reducing present facts to the basis which he adopted, and in others the obscurity of his language renders it difficult to decide his exact meaning. But the following propositions there can be no doubt about, and so we will use them, as showing wherein many favourable changes have taken place since the seventeenth century. In corroboration of his belief in the relative unhealthiness of London, Graunt asserts:—

1. That, in the country, but 1 of 50 dies yearly, but in London 1 in 30, over and above the plague.
2. That in London there have been 100 burials for 92 christenings; but in the country there have been, contrariwise, 121 christenings for 100 burials.
3. That about one-third of all that are born die under five years old.
4. That the autumn, or fall, is the most unhealthful season.

The records of the Registrar-General show that while the chance of life is as good now, in the country districts, as it was 200 years since, it has improved very considerably in our towns, the proportions being 1 death to 50 living in the former, and 1 death to 41 living in the latter.

Such a state of things as that the deaths exceed the births in number is, happily, only very rarely to be met with now, and that only in the most unhealthy localities. Last year, the births registered in London were, in proportion to the deaths, as 145 to 100, and the ratio was higher still (153 to 100) in the remainder of the country. The balance is again on the right side. Would that we could speak as satisfactorily concerning the third proposition; for the sad truth is, that taking the general experience of English life, as ascertained by recent observations, it is found that of every 100 children born 26 die before they attain five years of age—a very small improvement on Captain Graunt's reckoning. It is a lamentable fact that in those districts wherein are situated our largest towns, *nearly half of the whole mortality* is caused by the deaths of children; and Dr. Farr has very justly declared, that "the children of the idolatrous tribe who passed them through the fire to Moloch, scarcely incurred more danger than is incurred by the children born in several districts of our large cities." But to this part of our subject we shall advert hereafter.

After the experience of the last few months, it is not so difficult to understand how the seasons may vary within a wide range; and some such change in our climate would, perhaps, satisfactorily account for the difference between Captain Graunt's assertion that "the autumn is the most unhealthful season," and the Registrar-General's statistics, which show that, now-a-days, the first three months of the year are *invariably* those in which the greatest mortality prevails.

A Telegraph Line Six Thousand Miles Long.—The telegraph has lately been extended far up Fraser River *en route* for Russia, and is now in working order from New York *viâ* San Francisco to a point 400 miles above New Westminster, on Fraser River, making in round numbers about 6,000 miles.—*Panama Star.*

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are hereby offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best ESSAY or PAPER, and One Prize of Three Pounds for the Second Best Essay or Paper will be appropriated to each of the following subjects, under the conditions specified below.

LIST OF SUBJECTS.

I. THE FRANCHISE.

The advantages of its extension, and the mode of extension most likely to promote generally the interests of the working classes.

II. TRADES' UNIONS.

Special regard to be had to the advantages and disadvantages of Trades' Unions. How the former may be increased, and the latter diminished. The suggestions must be of a thoroughly *practical* nature, and, where possible, illustrated by corroborative facts.

III. THE BEST MEANS OF SECURING A PERFECT ORGANISATION AND UNITY OF ACTION OF ALL THE WORKING CLASSES AS A BODY.

Special attention to be paid to the carrying into operation of such practical proposals as a Working Men's Parliament—Central Hall—Council of Advice, or Arbitration—District Councils.

IV. THE ADVANTAGES TO THE WORKING MAN OF SUNDAY AS A DAY OF REST.

Special attention to be paid to such questions as Sunday Amusements, Opening of Museums, &c., in regard to the effect which the carrying into practice of such proposals would be likely to have upon the working classes.

V. STRIKES.

Are they justifiable under any circumstances? If not, How may they be avoided?—Courts of Arbitration—Instances where disputes between employers and employed have been settled without having recourse to strikes.

VI. EDUCATION.

Of Children—of Adults—of persons in their peculiar trades—Obstacles to education at present—Proposed remedies.

VII. CO-OPERATION.

To be discussed in regard to its *practical* application for Supply of Food—Or a means of union between working men for carrying on business—Co-operation as between employer and employed—Manufacturing Co-operation—Causes of Co-operative failures.

VIII. EXHIBITIONS.

Their advantages—How to start them—What class of articles should be exhibited—Prizes—At what intervals they should be held—Should artisans be allowed to exhibit specimens of their own particular trades?

IX. WORKING CLASS DWELLINGS.

New Government Rule on this subject—Building Societies, how to form them—The Co-operative principle, how it might be more extensively adopted—The difficulties of procuring sites—The class of buildings necessary—Cost of construction.

X. DOMESTIC ECONOMY.

Practical Hints upon Household Management—Food—Domestic Education.

CONDITIONS.

I. Each essay must be the original production of a *bonâ fide* working man, or the wife or daughter of a working man.

II. The same persons may send in essays on two or more of the subjects specified. The subject of each Essay should be written on the outside cover.

III. Each article must be written on one side of the paper only, and on the top of the first page must be written a motto corresponding with that on an accompanying sealed envelope, which envelope is to contain the writer's real name, occupation, and address. These envelopes will not be opened until the adjudication has taken place.

IV. Each essay must, as far as possible, be of a thoroughly practical nature, and should not exceed in length three pages of the Working Man. Each page contains about 2,320 words.

V. The essays must be sent in before the first day of June next, addressed to "The Editor of the Working Man, care of Messrs. Cassell, Petter, and Galpin, Ludgate Hill, London, E.C."

VI. The papers to which the prizes shall be awarded will be published in the Working Man, and are to be the property of Messrs. Cassell, Petter, and Galpin, who will reserve to themselves the right of re-publishing them in any manner best calculated to give them the largest amount of publicity and efficiency.

VII. The Donors of the Prizes, of course, reserve the right of withholding the prizes in any department in which, according to the opinion of the Adjudicators, none of the essays submitted shall have evinced sufficient intrinsic merit.

The names of the Adjudicators will be announced in a subsequent number of the Working Man.

Possible Uses of Consuls.

The English people are becoming more cosmopolitan every day. The old national insularity is breaking up. Time was when the foreigner conceived of us as incurably attached to everything English, and contemptuous to everything foreign—to foreign languages, foreign manners, and foreign principles. Bell and Fulton changed much of this when they invented steam ships. The nation went abroad: and when George Stephenson made railways possible, the people went about. Even home travel enlarges the mind, and produces liberality and geniality of feeling; and visiting other countries has a yet higher educational effect. There is found to be some wisdom abroad as well as at home. Foreign nations have experience as well as ourselves. Difficulties we have overcome one way, they have overcome in another, and, it often turns out, in a better way. Books of travel first made us aware of this; and afterwards, the increase of travellers personally verified the reports. Necessity, more than curiosity, has converted our working men into emigrants. Instigated by political economists, the Governments of former years began to promote emigration. Under these circumstances, a knowledge of other nations became highly needful. Working men naturally desired to know where they were going to, and what manners and customs prevailed in the countries to which they were advised to go. Even now, we know next to nothing of Russia. A *Times'* correspondent, at the close of the Crimean war, did penetrate into that vast region; but his revelations were suddenly brought to a close. Yet great numbers of our best mechanics are engaged in Russia, holding important situations, and earning high wages; and more would go if more was known. It would be useful to know something more of Russia. But we have small right, as yet, to complain of paucity of foreign knowledge: the general public do not know all that is taking place in England. In Allendale, and the lead mines of Allenheads, a more perfect system of communism—certainly a more perfect application of its principles—has existed for years underground than has ever existed on the surface of the earth in England. Very few persons out of Allendale are aware of this. No one in the House of Commons, where communism is so often a subject of adverse criticism, supposes that the honourable member for South Northumberland, Mr. Wentworth Blackett Beaumont, could give an instructive account of its partial operation in his mines.

Not knowing much of what takes place at home, and not wanting to know what takes place abroad, has, we suppose, been the cause of the small use which the nation makes of its means of collecting information as to the condition and devices of the industrious classes in foreign countries. In every port and station in the world we have consuls and consulate establishments. Could they not be made to throw light upon the condition and prospects of industry around them? Some time ago the Chambers of Commerce, through Mr. W. E. Forster, the honourable member for Bradford, called upon the Foreign Office to make that omnipresent agency instrumental in collecting facts in departments of trade and commerce. The industrious class, as well as the commercial class, might obtain useful information through the same channel.

Professor Fawcett, M.P., relates, in his "Economic Position of the British Labourer," that Mr. Browne, who was a few years since the English Consul at Copenhagen, made some most interesting observations with reference to the peasant proprietors of Denmark. Mr. Browne "bears the most decided testimony to their thrift, and also to the superior comfort in which they live." We learn from Mr. Consul Browne's pages that "the first thing a Dane does with his savings is to purchase a clock, then a horse and cow, which he hires out, and which pay a good interest. Then his ambition is to become a petty proprietor; and this class of persons is better off than any in Denmark. Indeed," says he, "I know of no people, in any country, who have more easily within their reach all that is really necessary for life than this class, which is very large in comparison with that of labourers."

These are instructive and suggestive facts; but we quote them more on account of their source than their value, obvious as that is. How few of our consuls have used their leisure to so great an advantage, and communicated information so useful to their countrymen at home! How many consuls lie in monotonous indolence in foreign lands, who might agreeably diversify their days by observing, inquiring, and collecting information concerning the peasant and artisan classes! Were the matter suggested, all of them could be useful in this way, and many of them would be glad to be so. Can no member of Parliament suggest this to the Foreign Office, or bring the question under the notice of Parliament, who would authorise it? Did there exist any proper organisation among the industrious classes, their Trade Societies would be as influential to procure this being done as the Chambers of Commerce have been in a similar case. It would be easy to prepare a series of questions, which the Foreign Office could send out to all consuls, and, in due time, publish the answers received. Were this done, not only would new emigrant fields be open, places discovered where British mechanics are wanted, but a flood of light would be thrown over the condition, the laws, the prospects, the earnings, and treatment of labour in all parts of the world.

Extension of Iron Works in the Cleveland Dales.—The quiet valleys and dales lying between the vale of Cleveland and Whitby are gradually being covered with iron furnaces and other works, and in a comparatively few years the development of their almost inexhaustible mineral resources will change the whole aspect of the country. At Rosedale, Kildale, Commondale, Glazedale, and Grosmont, large works have been erected, or are in course of erection, and new populations have grafted themselves on to the old villages. At Commondale there is an entirely new village, and the works are being rapidly extended. At South Kildale and Lindsdale, two more furnaces will be at once put up, making a total of five furnaces erected or to be erected as soon as the plans can be completed.

Opening of the Industrial Exhibition in the City.

The City of London Working Men's Industrial Exhibition was formally opened on Tuesday, the 6th inst., by the Lord Mayor. The noble Guildhall, with its newly-constructed timber roof, painted windows, and restored sculpture, was made gay for the occasion with flags of varied hue; and Gog and Magog—the representatives of the brute force of old times, when every able-bodied citizen was half a soldier—were discreetly hidden by a temporary orchestra erected at the western end of the hall. In Gog and Magog days—that is, the days when might made right, and mechanics and labourers were little else than serfs or villeins, unlettered, and almost as unintelligent as the stubborn materials they worked with—Industrial Exhibitions were never heard of. The art workman was a creation of later times, when towns were enfranchised by royal charters, and craftsmen were free to work out the ideas which the poetic idealism of their faith inspired. Some of their industrial exhibitions yet exist—in the painted windows of cathedrals, for instance, such as those of York and Gloucester, the life-long labour almost of one enthusiast, who received for his work a money remuneration which, even in those days of small wages, must have been wretched indeed.

But real Industrial Exhibitions are things of to-day. The fairy palace in Hyde Park was their real parent; and the children are not unworthy of their lineage. Working men and women have set to work to produce some little article of use or beauty—some notable invention or artistic creation; and in the Industrial Exhibitions now so general, have found the means of showing to the world what ingenuity, industry, and correct natural taste can achieve. It has been found almost impossible to keep out the manufacturing advertising element, which has really no claim to admission, but which, it must be allowed, adds greatly to the value of the exhibition merely as an exhibition; and many rare and beautiful objects are generally borrowed from the private collections of wealthy connoisseurs. But still there is such an ample nucleus of the real productions of amateurs, or the working classes, that the special characteristic of the exhibition is not materially invalidated.

A few minutes after two o'clock there was a loud *fanfaronade* of trumpets, and we all stood up to welcome the members of the Corporation. The Lord Mayor was accompanied by his daughter, and leaned on the arm of the venerable Dean of St. Paul's—the learned, poetic Milman, bowed with age, but with a lustre in his eye that showed how the intellect survives the active powers of the body.

When the Lord Mayor, aldermen, common councilmen, and the attendants had reached the daïs, where they were as closely packed as they possibly could be, a "Sanctus" and the simply sublime "Old Hundredth" were sung by the choir under the direction of Mr. Benedict, who subsequently came to the daïs to be presented to the Lord Mayor; and then, a prayer having been offered, Haydn's chorus, "The heavens are telling," was sung.

The Chairman and Secretary of the Committee of Management then read certain addresses to the Lord Mayor, but what they said was quite unheard beyond the precincts of the daïs. But we knew they would furnish the reporters with copies, and were quite satisfied to wait for the evening papers. The Lord Mayor made a capital speech in reply, and, like a sensible man, determined that all present should hear him, speaking in a loud, clear voice, with admirably distinct and emphatic elocution. In the course of his speech, he said—

Working men's interests are bound up with those of their employers, and the happiness and prosperity of individuals and communities rest entirely among themselves; by the one party conceding to the other their rights as artisans and workmen, and, on the other hand, by the workmen and artisans giving to their employers their ability, their energy, and their enterprise. For, permit me to say, enterprise and labour go hand in hand. One without the other would be worthless; but the two combined, under our happy constitution and our free and noble institutions, produce great results. Give us a fair field—we ask for no favour, invite no rivalry, but an honourable and independent competition—and then we say, Come east, come west, exchange your commodities for ours. If they are better and cheaper, we are prepared to receive them. If we succeed in establishing this incontrovertible fact, that we have been the producers and the manufacturers for the civilised world, give us the justice which we ask of you, and we are prepared to offer you, whether it be in the manufactures, in the arts, or in the sciences, the right hand of fellowship, to declare that all mankind is one brotherhood, and that what we seek is universal happiness. I will not detain you, but in the name of the committee declare this exhibition to be open, and may God speed it!

Handel's "Hallelujah Chorus" was then sung. Of course, we all stood up during the sublime chant, and at first were rather surprised to see the Lord Mayor and twenty or thirty other gentlemen put on their hats, but remembered that Jews—and Lord Mayor Phillips is a descendant of the sacred race—worship with their heads covered.

The Lord Mayor was then escorted round the exhibition, and at his return a vote of thanks to him was proposed and carried with three cheers.

CONSOLE TABLE.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

ORNAMENTAL WOOD-CARVING.

We trust that the instructions in wood-carving recently published by us will have the effect of inducing many of our intelligent artisans, who possess a taste for art, to attempt to become proficients in a branch of art industry, the practice of which is both pleasant and profitable.

In our industrial exhibitions we have found many beautiful specimens of the wood-carver's skill; and those who visit the London Guildhall Exhibition will do well to study the excellently-executed group of fruit exhibited by John Lucas, a wood-carver's apprentice. The wood-carvings of Edward Bedford also deserve notice. It would be much more pleasing to find working-class skill and taste exerted in the production of such articles than in such things as tables, caskets, and so forth, made of some hundreds of minute pieces of wood; or of models "cut with a single knife," &c. The true working man should be above such a misexpenditure of time and ingenuity. Once proficient in the art of wood-carving, the artisan would find himself enabled to attempt something more than simple ornaments. He might exert his skill and taste in the production of brackets, chairs, and other articles capable of carved ornamentation. Our illustrations show what has already been achieved in this direction, and afford hints as to what remains to be accomplished.

BRACKET.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

In speaking of the *Camden Town* Club last week, one other important fact relating to it should have been mentioned—viz., that the members last year formed a Limited Liability Company, and, with the aid of friends, purchased the whole of the premises. This spirited proceeding places them in a very advantageous position as regards rent, &c., and will probably prove eventually a source of profit, even to the shareholders.

The second annual report of one of the clubs mentioned before—viz., *Preston*, has just come to hand, by which I see that the large sum of £720 had been received during the year for refreshments, while the cost of provisions, &c., was only £561. No intoxicating drinks are sold, and it is gratifying to observe how large a profit may be made in some localities by good management, without taking any steps towards bringing the club to a level with the beer-shop. The average weekly number of members was 132; the previous year, 314; but the falling off during the latter part of last year may fairly be attributed to the attractions of their very successful exhibition. There had been sold during the year 3,410 tickets at 2d., and 3,784 at 1d., figures which represent a great amount of good conferred on workmen and their homes. No mention, however, is made in their report of classes; and for want of a hall they are unable to have entertainments, readings, or lectures. This, no doubt, is a great drawback. The hall, however, they hope shortly to procure by alterations of their premises or building, and the money they have gained by this exhibition ought to put them in possession of one capable of seating 600 people. With regard to classes, I would ask the managers of the club to consider the suggestions made in a former paper respecting the importance of promoting educational improvements in working men's clubs, and some of the ways in which gentlemen's help may be so valuable for that purpose.

In the *Sunderland* Club I find from their returns (though not personally acquainted with them) that there has been an excellent discussion class; French and drawing ditto, moderately well attended; elocution ditto, poor attendance; harmonic meeting every Saturday night, crowded. All this has, of course, been both cause and effect of their prosperity. A good discussion class is one of the best signs of a healthy state of things, and a great aid to it. Few things more effectually promote mental improvement and intellectual life. Theological topics should, however, be invariably excluded, as their discussion is almost certain to break up the club, besides being objectionable on other grounds. The number of members in this club last January was 750, and the average throughout the year was between 500 and 600. This is a very high average. Independently of other advantages, there must be capital management here, and a good spirit of fellowship among the members. The elocution class, however, ought to be better attended, or the harmonic meetings will, perhaps, suffer from want of new recitations and readings. A limited liability company has been formed by the committee for the purchase of a more commodious club-house, with more space for out-door games. The purchase was completed in January, and the club was then shortly to remove.

The club at *South Shields* is specially deserving of notice, from having been founded as a "Working Men's *Institute*" so far back as 1850, and having worked on quietly and usefully ever since. The members decided on adding the features and name of a club, after a visit I paid them in 1864, and their prosperity and usefulness has largely increased. They numbered, in January last, 653 members, and during the last year they have been self-supporting, for the first time in the course of their existence. They have a library of 1,298 volumes. Classes for arithmetic and writing, shorthand, French, and German. Six entertainments and six lectures during the six months ending December, 1865. But, since there is no restriction as to the age of admission, there is a little reason to fear that the men may be in danger of being swamped by the youths. Probably, however, as there is very good management, that evil may be guarded against by having separate rooms for the juveniles and adults. I shall have something to say on this head in speaking of unsuccessful clubs. It is utterly impossible to have a Working Men's Club, if youths are admitted to it, without the provision of separate rooms.

The *Newcastle* Working Men's Club is distinguished by zealous and efficient management, excellent entertainments, good discussion and drawing class, and a first-rate singing class, the latter consisting of between sixty and seventy young people of both sexes, and in which the presence of females has been thoroughly beneficial. Their able and genial-hearted teacher received a present of a watch from them last Christmas, for his kind and disinterested labours. This club has excellent premises, in a very good locality, yet it is not supported as well as it deserves to be: only numbers about 350 members, paya its way in winter, but is not self-supporting, owing to the falling off in summer time. The age at which members are admitted, however (seventeen), is far too young, and must have something to do with the defective support of *men*. The best room in the house, also, instead of being devoted to social intercourse, as it should be, is given up to newspapers and silent reading. This is not an uncommon mistake, but it is a serious one. However, the Newcastle friends have done, and are doing, an admirable work, and have great reason to be thankful.

The original club and institute at *Leeds*, which was established by Mr. Darnton Lupton, J.P., in 1863, and which, I said before, has been one of the most flourishing and useful in the kingdom, though very far from being self-supporting, averages between 900 and 1,000 members through the winter months. Its eminent usefulness has given a great impulse to the establishment of clubs in the district. They have one or two entertainments at least, and one lecture, every week through the winter months, the latter sometimes varied by a discussion; also reading, writing, arithmetic, and singing classes. A natural history society meets in one of the rooms. A religious service, conducted by ministers of various denominations, is held every Sunday afternoon, and is very well attended. An excellent "Branch" for boys has recently been opened by Mr. Lupton at Kirkgate, which is doing considerable good, and relieves the men's club from the damaging presence of lads. Several hundreds pay every week for admission.

The *Duck Lane Club, Westminster*, like that very interesting undertaking in St. James's Back, Bristol (of which an account was recently sent to the Working Man by its benevolent foundress), deserves a detailed account in these columns by an article to itself. For the present it must suffice to say that from soon after its first commencement, in 1860, it has averaged between 500 and 600 members. The good which it has accomplished is very striking, and in many respects it is a model for these societies, except in so far as, being intended for rather a limited range of labouring men, it does not aim at embracing that variety of agencies necessary for most working men's clubs and institutes.

Its wonderful success has been mainly owing, in the first instance, to the untiring Christian benevolence, good judgment, and tact of its foundress, but, secondly, to an excellent committee and secretary. The club also owed much of its successful start to the wisdom, kindness, and firmness of its first secretary, a costermonger. A religious service has been always held in this club on Sunday evenings, and a few of its members have frequently met on week days, in their dinner hour, for united prayer.

Mrs. Bayly's no less admirable and useful labours at *Notting Hill*, London, should also have a paper to themselves. The whole movement, I believe, owes more, in its origin, to these two societies, and the ladies who commenced them, than to any other single cause or individual.

The club at *Holloway* deserves honourable mention. 1st, on account of the zeal and devotedness of the honorary secretary, who originated it, and of the committee, who have so ably worked with him; 2nd, because of the harmony and judgment with which the few gentlemen on the committee and the working men there have pulled together; and, 3rd, because of its indefatigable and genial steward, who, by the warm interest he takes in the club, his delight and pride in making all the members comfortable, and his firm opposition to anything like disorder or infringement of rules, has most materially contributed to the success which this very useful club has been privileged to obtain.

In the *Rotherham* Club we must notice the cordiality with which a clergyman, a Dissenting minister, and a number of working men have co-operated, the brotherly spirit manifested by the members, and the large amount of usefulness resulting therefrom. Their premises and situation, also, were good, and were turned to the best account. Unfortunately, a railway ejection compels them to turn out, but it may be hoped they will soon procure some equally good, perhaps by a limited liability company, now that the working men have learnt the value of the club, for they earn excellent wages, and might have a first-rate club-house if they chose. The committee remark, with justifiable confidence, that they believe "the club has established itself in the affections of a large proportion of the upper crust of the working men of Rotherham; and from the steady increase in its numbers, it is fair to predict much greater results than have been accomplished." This I fully believe. Nevertheless, it would not be satisfactory to find that the average number of members at the beginning of January this year was only 200, were it not that I see the age of admission then was fourteen years. As this is at least seven years too young, and the club would probably double its number of grown men if none were admitted under at least twenty-one years (though twenty-five would be far safer), no doubt the anticipations above-mentioned will be amply fulfilled in the course of another year.

The club at *Heywood* is but in its infancy, having been established last autumn. It has, however, shown such remarkable vigour and judgment, that we may confidently predict for it a very honourable and useful existence. It has already held a most successful Industrial Exhibition, by which it will clear about £30, and it actually conducts a monthly magazine, price 1d., full of interesting matter.

The *Honley* Working Men's Club is another most promising club, numbering 320 members; but it is, perhaps, hardly fair to mention these juvenile specimens, stalwart and hearty as they be, until they have had a little longer trial, else I might refer to many other hopeful babies of about the same age.

The *Guildford* Working Men's Institute, however, is of venerable estate, compared with most, having been formed *as an Institute* in 1856, I think.* It deserves attention and honour, from the great success which has almost uniformly characterised its career, and from being by far the most flourishing society, hitherto, in the Southern counties—for a considerable time averaging 600 members. It has owed much to its wise and zealous librarian; also to the judicious separation of youths from the adults, thus receiving and preparing the lads for subsequent full membership without their annoying and driving away the men in the meantime. It had not been quite so prosperous the last year, but the managers are adopting several practical suggestions, and it will probably rise to even greater prosperity and usefulness than ever, should the same spirit of wisdom and good-fellowship continue to animate its members which they have hitherto evinced.

The Working People's Association at *Pendleton*, near Manchester, and the Charleston Institute, in the same place, are specially noteworthy for the large amount of good they are doing, and the unremitting devoted labour with which they are worked. The former includes a Working Men's Institute only as one of its agencies, and has an extensive organisation for missionary, temperance, and Scripture reading purposes. Capital entertainments are given every week; large and well-supplied reading and recreation rooms are filled nightly by the factory operatives, and the indefatigable honorary secretary has reason to be very thankful for the result of all his zealous labours. The Charleston Institute is a *bonâ fide* Working Men's Club, and its members enjoy the use, rent-free, of a first-rate building erected for them by B. Armitage, Esq., who has spared no cost of time and money to promote the welfare of the industrious workers in his great factory-hives.

(To be continued.)

* Continued from page 151.

* I find I have not the exact year of its birth.

Coin from the Crucible to the Press. *

The annealing-room is fitted with three pairs of ovens, heated on the reverberatory principle, and, in fact, the counterpart of those shown in a previous illustration as existing in the rolling-room. In this case, however, cast-iron pans are used instead of copper tubes. The pans are of sufficient capacity to hold 2,804 blanks each, that number weighing precisely 60 lbs. Troy. The blanks are placed inside, in *rouleaux*, and the whole covered by wrought-iron plates, luted and made air-tight with fire-clay. In this way they are charged on carriages into the ovens, where they remain for the space of forty-five minutes, or until the whole mass of iron and gold has been brought to a red heat. The carriages are then withdrawn, and the cases, with their precious contents, deposited on the floor to cool. Other batches follow in quick succession.

When the temperature of the blanks which have been baked becomes sufficiently low for the purpose, the cases are opened, and their contents discharged into copper trays for removal to the blanching, or pickling room. This is furnished with an open boiler of cast iron, lined with lead, to prevent the action upon it of the hot diluted sulphuric acid which it contains. There are also in this apartment a number of lead-lined cisterns, for the pickling of bronze blanks—they being submitted, after annealing, to immersions, of many hours' duration, in cold acid. Colanders, carboys of sulphuric acid, and cold water cisterns, with other minor appliances and materials, make up the fitments of the blanching-room.

Into a colander the batch of golden blanks—to which alone we shall for the present direct attention — is turned, and a stream of cold water is made to impinge upon them. This completes the annealing process, and the colander is conveyed to the boiler and placed in the hot *pickle*, as it is termed. With an ashen staff the workman next stirs them vigorously, so as to expose the surfaces of each blank to the biting effects of the acid. A minute or two of this kind of treatment suffices, and every particle of alloy in the form of oxide of copper is thus removed from the outside of the blanks, and incorporated with the acid, which is changed to a sea-green hue.† When this is accomplished, the colander is lifted from the boiler, and such films of acid as may adhere to the gold are washed away by a forcible stream of cold water, to the cleansing effect of which it is submitted. The change in the appearance of the blanks by this time is marvellous. From being a dull and brassy-looking collection of dumps, they are transformed into apparently brilliant discs of virgin gold, and their true characters cannot now be mistaken. As they have had their baths they require drying, and they are, consequently, transferred to a stove constructed for the purpose, and which is at hand. This consists of a plate of iron, beneath which are a series of flues and a fire; the upper surface being covered by *beechwood* sawdust—which answers the intended use to which it will be presently applied better than any other known material—it does not tarnish the precious metals. Into a sieve, placed on iron bars stretching across the stove, and which holds some of the sawdust, the blanks are put, and smartly agitated by the attendant. The sawdust, of course, passes down through the meshes of the sieve back upon the stove-plate, where its dampness speedily evaporates. The blanks remain even brighter than before, for the slight friction has had the effect of polishing them. To free them from fine portions of dust, they are next put into a perforated copper cylinder, or "muffle," and this, inserted into a heated air-bath, is shaken dexterously. Now, therefore, the blanks are soft, clean, perfectly dry, and prepared to receive from the dies those impressions which fit them for the performance of their subsequent mission, and which make them ministers of good or agents of evil, as their future possessors may be actuated by virtuous or vicious proclivities.

Silver blanks of all denominations, it may be said, pass through processes almost identical with those explained in regard to gold, the acid employed being, however, a stronger solution. Silver pieces are, in point of fact, *frosted* by their immersion, all traces of copper on their exteriors being absorbed by the pickle. Bronze pieces undergo operations so slightly differing from those performed upon their richer relatives, that they need not here be further alluded to. Being composed of a common material, they are more roughly treated, and are shaken in the drying stage by machinery instead of gentler hand manipulation. Let us return, therefore, to our gold, batches of which have been passing in rapid succession through fire, water, &c., towards what is literally their crowning destination, the stamping-press.

The Coining-press room at the Mint is a very handsome apartment, as will be seen from the illustration given in the last chapter. It is 70 ft. in length, 30 ft. in width, and 15 ft. in height. The central part of the room is occupied by a stone platform, encased with iron plates, and this forms a base for the eight presses which make the sum total of the stamping machinery of the establishment. The presses themselves are of compact and symmetrical construction, and very massive. Each machine, indeed, weighs nearly two tons, and they are all firmly bolted down upon beds of Portland stone. Two lines of oaken columns, extending from the platform to the ceiling, encompass the presses, and iron bars stretching across the platform connect them (the columns) together in pairs. The bars also support buffers, composed of alternate layers of wood and leather, and which limit the travel of the fly-arms of the presses. Through the centre of each of the latter passes a coarsely-pitched, treble-threaded screw. But, perhaps, it will facilitate the comprehension by our readers of the action of the stamping machinery if we confine our attention to a single press, the whole being made on precisely the same principle. The screw, of which mention has just been made, supports two vibrating arms. These are of iron, their ends terminating in boxes of the same material, and which may be loaded with weights to give more effect, when needed, to the blows which are to be administered to the metal discs below. From the centre of the arms of the press rises a hollow, trumpet-like shaft, which passes through the floor of the chamber above the press-room, and is the medium for communicating motion to the screw. To the lower end, or point, of the screw is attached the upper die-holder; and immediately below this, on the base of the press, is firmly screwed the lower die-holder, both being fitted with set-screws for attaching the dies.

On the floor above the press-room, and in a chamber behind it, are the appliances for communicating the vibrating motion required for raising and depressing the upper die, which alone moves, the lower one being a fixture. The arrangements for working the press are curious, and before proceeding to explain the exact mode of stamping money, something may be said in explanation of them. For many years those arrangements were made a great mystery of, and the machinery composing them was known as the secret department of the Mint, to which no ordinary visitor was ever admitted. There are no "secrets" in the establishment at present; and, indeed, the age of mysteries is rapidly gliding away. Of course, the prime mover of the presses is the steam-engine, but it performs its mission indirectly, and through the agency of an air-pump. This latter is attached to the beam of the engine, and its duty is to exhaust a vacuum tube, which extends along the whole length of the press-room, but which is not seen from that apartment. A barometer-gauge and a weighted relief-valve enable the attendants to regulate precisely the extent of the vacuum within the chamber. The chamber itself is furnished with eight small pumps, placed vertically at intervals along it—one pump, that is, for each press. The pumps are open at the top, and pistons move freely within them. Below the pistons, in each case, are two small disc-valves, one opening outwardly to the atmosphere, and the other inwardly to the vacuum-chamber. Small levers and springs serve to open and shut, self-actingly, the valves. The piston-rod—taking again one machine for illustration—is extended above the pump, and is attached by means of links to a small horse-head crank, which is connected by a horizontal bar of iron to a lever on the upper end of the trumpet-shaft of the press.

(To be continued.)

* Continued from page 149.

† The quantity of alloy thus disposed of has been already allowed for by the small extra portion introduced into the crucible, as described under the heading, "Melting-house."

Professor Fawcett, M.P., on the British Labourer.

Under a well-chosen title, and in a well-written book, Professor Fawcett discusses the "Economic Position of the British Labourer." The volume published under this name consists of lectures addressed by the author to his Political Economy Class at Cambridge University. Considerable personal interest, as our readers are aware, attaches to the author, as being the first blind Member of Parliament ever elected. To have attained such a distinction, in spite of such a calamity, and so great a disadvantage, implies great force of character, and the possession of no ordinary talents. Had Mr. Fawcett been a military officer, maimed in some memorable engagement, in which he had borne a distinguished part, legislatorial elevation had been intelligible as a honorary reward for past services; but to be sent to Parliament in expectation of services to be rendered under physical disability which destroys the energy and hope of ordinary men, is, in itself, a memorable and honourable distinction. Since the singular accident, by a gun-shot wound, which destroyed the sight of both eyes, Professor Fawcett has published a "Manual of Political Economy" of very great merit, and now he has added to the obligations the public are under to his pen, by publishing a new volume, bearing the practical title we have cited—the "Economic Position of the British Labourer."

This is a book which concerns the working man. Viewed from the point of his economic position, a new field is opened as to his condition. The field is spacious and instructive, and the author sweeps it with a strong and clear mental glance. There are expressions in the book very curious, and some surprising; but these it would seem hypercriticism to enumerate, when the conception of the work is logical, its sentiments bold and generous, and the treatment of each topic clear and consecutive.

Nationally considered, the economic position of the British labourer is bad, and ought to be amended—and can be amended. This is the moral of Professor Fawcett's book. This doctrine, coming from one who has charge of the education of our youth in one of our chief universities, has special value on that account. What is said by one in such a position will have the attention of those who influence, and will in the future influence, public affairs. What is said from the chair of political economy of the Cambridge University becomes matter of authority. The author writes with an accuracy of thought which can be trusted; he speaks as one under responsibility, and his words can be quoted. They are of value, too, as an indication of what the author's career must be in Parliament. Professor Fawcett is an astute, shrewd man. He perfectly comprehends the position which he has sought and won, and he is fully aware that his words are pledges of his principles. He will be judged by the standard he sets up. Publicly and personally, therefore, his words are worthy of study.

In his earlier pages of the work of which we speak, Professor Fawcett lends confirmation to an opinion that many already definitely entertain—that hired labour will pass away, and be succeeded by associated labour. The honourable member's life has been passed in a very different county from Buckinghamshire; yet the picture he gives of the position of the agricultural labourer as he has seen it, is exactly what we have witnessed no farther from London than Bucks. "Theirs," he says, "is a life of incessant toil for wages too scanty to give them even a sufficient supply of the necessaries of life. No hope cheers their monotonous career. A life of constant labour brings them no other prospect than that, when their strength is exhausted, they must crave, as suppliant mendicants, a pittance from parish relief." Then he asks, with honourable indignation, "Will generation after generation be content to pass the same dreary existence, when, in other countries, with a climate as healthy as our own, with institutions as free, they may at once become landed proprietors, and they may see definitely placed before them a career of affluence and prosperity?" Such a question, so pertinently put, is calculated to penetrate even the dulled perceptions of the British agricultural labourer, and may possibly awaken feelings of wise and emigrant intentions in the minds of a

class of artisans who can least be spared from our midst.

How is it that England has been brought into the condition in which her labourers fare so wretchedly? Who has brought this to pass? Can it be true that our aristocracy are the mainstay of this land, and have not prevented this? England was not always in this condition. Five centuries ago, Chief Justice Fortescue, who was afterwards Lord Chancellor of Henry VI., gave a very different account of the condition of England question. He knew the country well; and when he was preparing a royal prince for residence here, he, in a splendid passage, said:—

The country of England is so filled and replenished with landed men, that therein so small a little hamlet cannot be found wherein dwelleth not a knight, an esquire, or such householder as is there commonly called a Franklin, enriched with great possessions, and also other freeholders, and many yeomen having sufficient estate to make a jury.

The author of an important work on "Self-Government," Mr. Toulmin Smith, a fully informed writer on old English life, says:—

It follows that, in his (Fortescue's) time, there were, at the least, forty-seven freeholders in every hamlet; and the proportion of male adults to inhabitants being one to five, this implies that almost every grown man was a freeholder.

Where are the freeholders now? Masses of indigent labourers, as we know them now, were unknown in England then. If any one doubts it, let him turn again to the quaint and graphic pages of Lord Chancellor Fortescue, as translated by John Selden, and read this picture of England five centuries ago:—

Every inhabiter of that realm useth and enjoyeth at his pleasure all the fruits that his land or cattle beareth, and with all profits and commodities which by his own travail, or by the labour of others, he gaineth, by land or by water. They drink no water, unless it be so that some for devotion, and upon a zeal of penance, do abstain from drink. They eat plentifully of all kinds of flesh and fish. They wear fine woollen cloth in all their apparel. They have also abundance of bed coverings in their houses, and of all other woollen stuffs. They have great stores of all hustlements and implements of household. They are plentifully furnished with all instruments of husbandry, and all other things that are requisite to the accomplishment of a quiet and wealthy [well-to-do] life, according to their estates and degrees.

There were no Lambeth workhouses in those days needed, nor employment for "Amateur Casuals." We hear a good deal of going forward. It would be well could the British labourer go back to the days of Henry VI.

But to return to Professor Fawcett's book. He clearly apprehends the nature of the social forces now happily at work. He describes "Co-operation as the inauguration of a new era," which he thinks needed. Pauperism is disgracefully gigantic. The agricultural labourer has no motive for industry and saving: between employer and employed no common interest exists; the country is in danger of losing its best workmen as soon as the opportunities of emigrant prosperity are understood. It is time we had peasant proprietorship in the country and co-operative factories in town. Primogeniture and right of entail restrictions on the sale of land should be removed. Such are the positions, stated with great clearness and reasoned out with force, which occupy the pages of Professor Fawcett's book. Though addressing a class no doubt familiar with legal and technical nomenclature, the lecturer insinuates rather than obtrudes definitions of such terms as primogeniture, intestacy, entail, and similar words, upon which it is essential the reader should have definite and accurate notions. Sometimes the definition is concealed in an illustration, sometimes suggested in explanatory remarks; but it is there, and there so plainly, that the ordinary workman can understand the matter. The author is wise in that experienced school described by Pope (in which so few are proficient), who said,—

"Men must be taught as though you taught them not,
And things proposed as new as things forgot."

The "Economic Position of the British Labourer" is worthy a working man's perusal, not alone for the instruction it contains, but also for the way in which it is conveyed. One great subject is conceived, its general relations are grasped, and the author always keeps to his subject. He makes Roman roads through it; he keeps the reader on broad highways; he makes no discursive bye-paths to everywhere out of it. The reader knows what place he has left, and where he is going to. He can tarry on the way if he chooses, but he never loses his way; he can return if he is so disposed, or he can take up his staff (of attention), and continue his journey to the end. The author is master of the situation, and he makes his reader master of it too.

Things Talked About.

Among the shareholders in Greening and Company (Limited), at Manchester, is Mr. Thomas Hughes, the member for Lambeth; and he, we are informed, is the writer of an address just issued to the workmen and others in the employ of the company. We recently announced that the workmen had been specially invited to take up shares in the company, and that invitation is enforced in very emphatic terms by Mr. Hughes. His words are worth weighing by others who are not connected with the firm he represents. He says—"We ask all of you who are in the employ of the company, shareholders and non-shareholders alike, to remember the great principle which is at stake in our undertaking. We have come to you of our own accord, in the faith that business may be carried on successfully where all are, in the fullest sense of the word, fellow-workers. We come to you with faith in our principles, with trust in you, with a successful-going business. Have *you* faith in that principle which is yours as well as ours, which has its warmest advocates amongst your own ranks? Will you trust us, and meet us half way, shaking hands over all past antagonism, and setting your faces resolutely towards the new future which is now opening to us all? If you will do this loyally and in good faith, helping to make this company known to the trade for thoroughness of work, for punctuality, for trustworthiness of all kinds; if you will be careful of all material entrusted to you, jealous of the least waste, willing to help each other and to help us, then we, on our part, have no fear whatever as to success, and are quite ready to stake our credit upon the issue."

Most heartily do we hope that none of our readers may ever have personal experience of the casual ward of a workhouse; but as none of us can be destitute of sympathy for the very poorest and most wretched of our fellow-creatures, and as every rate-payer can do a little towards obtaining a remedy for a state of things disgraceful to a Christian country, we direct attention to a remarkable paper in the current number of *Temple Bar*. Mr. Parkinson, a gentleman connected with the *Daily News*, who has devoted himself to the task of exposing the laxities and cruelties attending the parochial administration of the Poor Laws, has discovered one of the inmates of the now famous Lambeth casual ward, on the night when Mr. Greenwood witnessed the scenes he so powerfully described in the *Pall Mall Gazette*. This man, who had received a better education than generally falls to the lot of tramps, and is evidently possessed of good, though sadly misused abilities, amply confirms all Mr. Greenwood's statements, and adds, from his own experience, descriptions of the casual wards of nearly all the metropolitan workhouses. It is a fearful record of insolent, ignorant indifference and inhumanity on the one hand, and of recklessness and depravity on the other. It was time, indeed, for the Poor Law Board to interfere, and enforce upon so-called guardians the necessity of at least attempting to do their duty.

The preparation of a new Reform Bill has called forth abundant statistics, not only in response to the Ministerial demand upon various official departments, but also in the pages of influential periodicals. When they are analysed and compared, we shall obtain a clearer view of the real position of the working man as a member of the State than hitherto we have been able to obtain. A writer in the *Edinburgh Review*, a year or two since, devoted an article to an examination of the incidence of taxation on the labouring classes, and the *Pall Mall Gazette* has enlarged upon the idea. The result is thus stated:—"The working classes (of the United Kingdom), whom we may take at 23,000,000, with an aggregate income of £230,000,000, pay about £26,000,000 in taxation—that is, nearly 23s. a head, or 11½ per cent. of their income. The upper and middle classes, about 8,000,000 in number, with an aggregate income of £350,000,000, pay £58,000,000 of taxes—that is, £7 10s. per head, or 16 per cent. on their income." The writer says, with some warrant for the statement, "On the whole, the industrious and the sober labourer comes off tolerably cheap, and may escape altogether if he pleases. If he confines himself to strict necessaries, he pays no taxes at all. If he chooses to consume taxed commodities, he does so voluntarily, and he does so, it is presumable, because he can afford the indulgence." This is worth thinking about. Figures show that the working classes annually contribute nearly £8,000,000 (or about three-fourths of the whole amount) to the duty imposed on British spirits; £1,500,000 to the impost on rum; more than £4,000,000 to the malt tax; and nearly £5,000,000 to the duty on tobacco and snuff. Altogether, about £18,500,000 is paid by working men for the privilege of indulging in articles which they certainly might dispense with without any very great injury—perhaps with very great benefit.

Earl Brownlow, who owns Ashridge Park, near Berkhampstead, appears to entertain an impression that a portion of the tract known as Berkhampstead Common is his property. Accordingly, a few weeks since, he enclosed a space about two miles long and rather more than a mile broad, with strong iron railings five feet high, altogether a very substantial enclosure. Now, Mr. Augustus Smith, M.P., lord of the Scilly Isles, is also a landholder at Berkhampstead, and as such claims his share of common rights. The poor cottagers in the neighbourhood are not strong enough to enter upon a contest with a Peer of the realm; but Mr. Augustus Smith is, and set to work much in the same fashion that northern earls and barons formerly maintained their border rights. He engaged an army of blacksmiths, 120 strong, chartered a special train from Euston Square, and at one o'clock on the morning of Tuesday, the 5th instant, the resolute band marched from Tring station to Berkhampstead Common, and made very short work of removing the offensive rail. When morning came, the neighbouring villagers heard of the bold feat, and, we are told, "the inhabitants of the adjacent village and district flocked upon the scene. In carriages, gigs, dog-carts, and on foot, gentry, shopkeepers, husbandmen, women, and children, at once tested the reality of what they saw by strolling over and squatting on the common, and cutting and taking away morsels of gorse, to prove, as they said, 'the place was their own again.'" Of course, lawyers will now take the matter in hand; and if Mr. Augustus Smith succeeds in proving that he only resisted an unwarrantable encroachment on a popular right, the lesson will not, probably, be without its uses to those who "steal the common from the goose."

We see, by the way, that Mr. Cowper, the First Commissioner for Public Works, has given notice, in the House of Commons, of his intention, on an early day, to move for leave to bring in a bill for the improvement of commons in the neighbourhood of the metropolis, and the protection thereof.

Petitions are pouring into the House of Commons in favour of the Artisans and Labourers' Dwellings Bill. The medical officers of health, who best know the evils of overcrowding, are foremost in the ranks of the petitioners, and incumbents of parishes and churchwardens are also sharing in the good work. A rather curious suggestion is thrown out on the subject, and that is, the utilisation of railway arches as dwellings. We should think the perpetual vibration would have an injurious effect on the health of the inhabitants. Something better than that must be devised. The suggestion looks like an ingenious attempt, on the part of some of the railway companies, to obtain rent for what is now comparatively useless to them, and so, positively, be rewarded for the evils they have themselves caused.

Grudgingly, indeed, the companies yield to the necessity of making some concession to the convenience of working men. Some of the metropolitan lines, indeed, run special "workmen's trains," at low fares; but they are now applying to Parliament for bills to lessen their liability in the case of accident to third-class passengers. Already the liability is limited to £100 in the case of passengers by workmen's trains, and that restriction they wish to apply to all third-class passengers, who are quite neglected enough as it is. We trust the application will be refused.

The Corporation of Liverpool have purchased of the Earl of Sefton a large tract of undulating land, with an area of nearly 400 acres, for a public park. It is proposed to lay it out in splendid style; and it can scarcely fail to be a great boon to the townspeople.

At the Durham Assizes, Mr. Justice Mellor had occasion to condemn most emphatically the plan of paying wages at public-houses. He said, "The amount of mischief and crime arising from this mode of paying wages in this county is far greater than all the churches and chapels that can be built will remedy. I have had seven cases to try of crimes of violence imputed to men apparently of good character when sober, who have all been tried on serious charges of felonious wounding, and all under the influence of drink." His lordship concluded with expressing a hope that employers would alter this practice of having men paid their wages at public-houses. "Decent men began with calling for a glass or a pint of ale, not intending to drink more, and they went on drinking until they became intoxicated, and frequently lamentable acts of violence were the consequence." Not in the north alone, but in London and other large towns, has this pernicious practice prevailed; not always by the desire of the employers, but because the wages of a number of men are sometimes paid in a lump sum to a foreman, who chooses the public-house as the pay place. The system is essentially wrong.

The London painters are determined to emancipate themselves from what they call the "evils of public-house meetings," and are getting up a company on the limited liability principle, for the establishment of a "Painters' Hall, Library, and Reading-room." The hall is to accommodate a thousand persons, and there are to be other rooms, which, with the hall, may be occasionally let for trade and society meetings, and other analogous purposes. The temporary offices of the company are at 39, Upper John Street, Fitzroy Square.

Trade movements are active among the men engaged on the Thames. The free watermen and lightermen have had a meeting for the purpose of establishing a

trade protection society, with the object of securing an advanced rate of wages, doing away with Sunday work, and obtaining an amendment of the Watermen and Lightermen's Act. There is a strike among the barge-builders, who have nearly all gone out on a demand for an increase of wages.

The short time movement has obtained legislative sanction in America, the Ohio House of Assembly having passed a bill fixing eight hours for a day's labour in that State.

Happily there has been no necessity for the employment of the military called out in consequence of the miners' strike near Tavistock. The chairman of the Devon Great Consols mine has addressed the men in a calm and reasonable manner, and we are glad to record that a better spirit appears to prevail. The chairman told the men that "the mine was kept open more for the benefit of the miners, because if it stopped they would be thrown into extreme distress, and this it was wished by the directors should be avoided. He had lost in Cornish mines no less than £30,000 during the last year, and this money had been expended upon the miners. The latter had, therefore, a duty to have some consideration for mining adventurers who expended their capital in setting the mines to work. If it had not been for those gentlemen's outlay, the shafts that at present existed would never have been sunk." The proprietors and agents are resolute, and at a meeting held on the 7th instant at Plymouth, agreed to some stringent resolutions. A committee was formed to take measures to found a miners' benefit society.

Several of the large coachmakers have decided to close their workshops at four o'clock on Saturdays, instead of six. Others have offered to adopt a similar course if the men will only take half an hour for dinner on Saturdays, which proposal has been refused.

Co-operative Intelligence.

The Result Co-operative Society, Cornwall Road, Brixton, held their first social gathering at the Victoria School-room, Cornwall Road, Brixton, on Wednesday, 14th February, 1866, when upwards of 200 members and friends sat down to an excellent tea, after which an entertainment was given, presided over by the treasurer. Short speeches on the Co-operative principles were ably delivered by Mr. Pocklington, from the Central Association of Co-operation. Mr. H. Kemp, the secretary, read an extract, showing the steady increase of this society, which had only been established seventeen months, and had sold goods amounting to £3,404 19s. 0½d., realising a profit of £527 11s. 9½d., from which, after paying £5 per cent. interest, reducing fixed stock at £15 per cent., and paying all management expenses, sufficient had been left to pay an average bonus of 1s. 6½d. on every pound laid out by the members. The total number of members on 31st December, 1865, was 181, and their united capital £415 7s. 3d. The proceedings of the evening were enlivened by a musical entertainment, which elicited much satisfaction. The above, with some recitations, made up a very agreeable evening's enjoyment, and has given a stimulus to the principle in our neighbourhood. After a vote of thanks to the chairman, officers, and friends, and to the trustees for the use of the school-room, the meeting separated.

Cheap Meat Association at Leeds.—In consequence of the present enormous prices charged for meat, a Co-operative Cheap Meat Association has been established in the north-east and east wards of Leeds, and a large business is expected to be done. About 200 shares have already been taken up.

Barnsley (Yorkshire) British Co-operative Society.—A special general meeting of the shareholders of this society was held recently, in the Market Street School-room, Barnsley. There were nearly 100 people present. The president of the society, Mr. W. Tunker, occupied the chair on the occasion, and explained the object of the meeting, which was to consider the propriety of raising more capital for the erection of new stores. He said that, through the want of more accommodation, some of the goods are injured; that salesmen cannot dispatch customers as they ought, and that, for want of better access to the drapery-room, only a limited business is done. He said that their only remedy was to build new extensions to, and make enlargements of, the buildings. On the motion of Mr. W. Hoey, seconded by Mr. J. Healy, it was unanimously resolved—"That this meeting hereby empower the building of new extensions and enlargement of the premises in Wellington Street, Barnsley." It was also resolved, on the motion of Mr. J. Barraclough, seconded by Mr. W. Ward, "That this meeting recommend the shareholders who as yet have not five shares in the society, to allow their dividends to be transferred to their shares quarterly, and no dividends to be withdrawn until the amount of five shares be made up, but interest at the rate of £5 per cent. per annum to accrue to the respective amount of shares, if above ten shillings." There was no doubt entertained that there would be any difficulty in obtaining the amount required for the new building, fixtures, &c., which will be nearly £1,000. This sum will be derived from one year's profit, at the present rate of the society's operations.

General Information.

CLUBS AND INSTITUTES.

The Albert Working Men's Club, Knightsbridge.—We have just received the very interesting report of the above club, containing the account of their progress for the first half-year, by which it appears that it is highly successful. It was founded by Mrs. M'Garel, (Belgrave Square), and was opened at a meeting held last June, presided over by Lord Radstock, and attended by Lord Harris, Chamberlain to H.R.H. the Prince of Wales, the Hon. A. Kinnaird, the Hon. W. Ashley, Mr. Judge Payne, and other gentlemen, who addressed the meeting. The Rev. H. Solly was prevented from being present by having to attend another meeting. 200 working men were present, 63 of whom were enrolled as members. Since that time members have been enrolled to the number of 400. The club-house consists of refreshment and smoking-room on the basement story, general reading-room and committee-room on the first floor, two class-rooms, and a kitchen. Adjoining the club, at the back, is a lavatory, and a hall for lectures, &c. Twelve lectures have been delivered on very interesting subjects during the half-year, which have been also attended by the wives and daughters of the members. There are addresses delivered in the hall on Sunday afternoons, and a Bible-class is held on Thursday evening. No beer, wine, or spirits are allowed in the refreshment-room, but an excellent cup of tea, coffee, or cocoa, can be had for 1d., a slice of bread and butter for 1d., and a chop or steak can be cooked if required. There is a library of about 150 volumes. The rules seem to be excellent; and we recommend any one wishing to see a club in good working order to pay a visit to the Albert Club. If the committee could see their way to allowing refreshments to be sold in the middle of the day, instead of in the evening only, it would be an improvement; but, even as it is, it is a great benefit to its members. To use the words of a contemporary in speaking of this club, "with chess, draughts, classes for education, classes for singing, a reading-room, a smoking-room, and a library, who should not be content?"

Working Men's Club and Institute Union.—The usual monthly tea-meeting was held in the office of the Union on Thursday, the 1st March. Notwithstanding the inclemency of the weather, it was very well attended, and much interesting discussion took place. The question which formed the chief subject of conversation was the consideration of the admission of youths into clubs, at what age persons should be admitted as members, and, if youths are admitted at all, under what regulations they should be placed. As this whole matter will be specially handled by the Rev. H. Solly in a future number, it is unnecessary at present to say more on the subject.

The London Association of Foremen Engineers.—On the evening of Saturday, the 3rd inst., the ordinary monthly meeting of members of this society took place at its rooms, Doctors' Commons, City. Mr. Joseph Newton, of H.M. Mint, president, filled the chair, and the subjects discussed were of considerable interest, public as well as professional. It was the general opinion that a more commodious place of assembling must, ere long, be obtained, so rapid is the growth of the institution. The question of establishing a hall and library, exclusively for foremen engineers, is one which has often before engaged the attention of the committee, and there can be no doubt that such an arrangement would be highly beneficial, not only to foremen, but to employers, who must derive advantage from the increasing intelligence of their *employés*. We trust that the aspirations of some of the leading members of the association in this direction may one day, and that not distant, be realised. The main interest of the proceedings of Saturday was centred in the reading of a paper by Mr. J. M. Oubridge (of Messrs. Simpson's, Pimlico), on "The Various Modes of Smelting Iron." The author traced succinctly the history of the art, from the very earliest periods, in this and other countries, and illustrated his subject by diagrams, drawn *en courant*, explanatory of primitive and modern methods of smelting. The paper was listened to with marked and critical attention, and at its conclusion Mr. Onbridge received a well-earned vote of thanks. Messrs. Keyte and Briggs joined in the discussion which followed, and which was finally adjourned to the next meeting, on the first Saturday in April. At eleven p.m. the meeting was dissolved.

Edmonton and Tottenham United Working Men's Club.—A public meeting has been held in the large school-room, Upper Edmonton, for the purpose of furthering the objects of the Edmonton and Tottenham United Working Men's Club. Viscount Enfield, M.P., had kindly consented to take the chair, but was unfortunately prevented by the death of a very near relative. In his absence the chair was occupied by Edward Busk, Esq., J.P., of Winchmore Hill. The meeting, which was very well attended, was addressed by the Rev. H. Solly and other gentlemen of local influence. There is a peculiarity in the way in which this club has been started, which deserves to be specially noticed. On other occasions it has been usual for persons of property in the neighbourhood taking an interest in working men's clubs to subscribe to the amount of from £50 to £100, or even more, for the purchase of furniture, books, &c., and other preliminary expenses; but in this case the men themselves are making a successful effort to raise the necessary sum by a limited liability company. They propose that the capital should be £250, in 1,000 shares of 5s. each. 200 shares have been already applied for; and the directors appeal to all classes who feel an interest in the moral and social welfare of the neighbourhood to aid them by taking shares. The proposed subscription for members is 2d. per week, which, the directors calculate, will be amply sufficient for the working expenses of the club, and will also yield a good dividend to the shareholders.

WAGES AND STRIKES.

The Building Trade at Woolwich:—About 700 operatives in the various branches of the building trade at Woolwich and Plumstead have struck work, consequent upon the refusal of the employers to accede to a memorial, recently sent in by the men, requesting the privilege of leaving work on Saturdays at one o'clock, as is now the general custom in the London district of the building trade. The men have held a large meeting, in which they pledged themselves not to resume work until the one o'clock time was conceded. Amongst the number who have thus turned out are 169 men from Mr. Kirk's shop, 152 from Mr. Tongue's shop, and the remainder are made up from the smaller shops. The strike comprises both society and non-society men, and, to support the latter and the labourers, who have no union to fall back upon, the committee have issued an appeal to the trades at large. The following employers in the district have conceded the request of the men—viz., Messrs. Matthews, Blake, Capper, Saunderson, Barnes, Burch, and Reed.

Meeting of Engineers.—A crowded meeting of operative engineers has been held at the "Yorkshire Grey" Tavern, High Street, Stratford, in furtherance of the movement for the advance of 10 per cent. on the present wages. Mr. Bentley occupied the chair, and the meeting was addressed by Messrs. Clark, Giffard, Horn, Trench, and several other operatives, all expressing their opinions that the time had now arrived when their labour required to be more fairly remunerated, and an especial effort made to raise the wages paid in the low-priced shops. Any idea of a strike was deprecated if it were at all possible to avoid it, and it was urged that the advance could be obtained either by a general conference between the masters and men, by deputations from the men in each shop waiting upon their respective employers, or by arbitration. The whole question in all its bearings was long and earnestly discussed, and a resolution was adopted, "That the men in the Stratford district should co-operate with the general committee to promote the movement."

Hand-loom Weavers at Barnsley.—On Monday, the 5th inst., the hand-loom weavers in the employ of Messrs. T. Taylor and Son, the well-known linen manufacturers, celebrated an advance of from 10 to 15 per cent., which has just been given to them on all kinds of work. The firm also gave them £5, which they expended in a tea-meeting at the "Albion" Inn. During the evening votes of thanks were accorded to the firm for their liberality. The evening was spent in a pleasant manner.

Masters and Operatives. Lord St. Leonards' Bill.—An adjourned meeting of trade delegates has been held at the "Bell," Old Bailey. Mr. Robert Danter, president of Trades' Council, and chairman of the Amalgamated Society of Engineers, &c., presided. The delegates appointed to represent the different trades at this and previous meetings, for the consideration of Lord St. Leonards' Bill, were accredited by a number of working men amounting in the aggregate to nearly 100,000. After some discussion the following resolution was carried:—"That this delegate meeting of the London trades, having discussed the principles and objects of the Bill brought forward in the House of Peers (1865) by Lord St. Leonards, entitled 'Conciliation of Equitable Councils Bill,' composed of masters and operatives, for the settlement of disputes and differences, as set forth in the Act 5 George IV., cap. 96, and for extending to the said councils, by the mutual consent of both parties (to the dispute), any other matter relating to the peace and welfare of masters and operatives, notwithstanding the dispute may have reference to further contracts or bargains respecting wages, hours of labour, or other questions which may from time to time arise, reserve to ourselves to suggest such alterations in the details as may seem necessary. Further, that the delegate meeting recommend that all disputes and contracts to serve be submitted to the said councils for adjudication and settlement, and that the power given to enforce awards, as set forth in the said Bill, be extended to all disputes arising out of contracts to serve (except contracts relating to servants in husbandry)."

Large Meeting of Master Builders in Manchester.—On Wednesday, the 7th inst., the annual meeting of the General Builders' Association was held, at the Palatine Hotel, in this city, and was attended by about 200 delegates from the various towns in England and Scotland. Mr. Henry Lovatt, of Wolverhampton, president of the Association, took the chair. A lengthy discussion took place on the subject of contract

agreements, the method of taking "quantities," and other things affecting the relations existing between contractors, engineers, and architects. A very general opinion was expressed that but little difficulty would be experienced in placing such matters on a footing much more satisfactory to the trade. The question of trade disputes then occupied the attention of the meeting; and, although some very severe remarks were made on the arbitrary conduct of the operatives in respect to their interference in preventing the masters employing apprentices and workmen who do not belong to the unions, on the whole a kindly feeling was expressed towards the workmen, so far as regards their right to share in the general prosperity of the country, and to be well remunerated for their labour. A determination was generally expressed not to allow Saturday to be further shortened; and a strong and very unanimous desire was evinced that all workmen should be paid by the hour. The latter question was specially referred to the committee for consideration.

BUILDING AND BENEFIT SOCIETIES.

Temperance Permanent Land and Building Society.—The twelfth annual meeting of members was held on Wednesday evening, February 28th, in the large room at the London Coffee House; Mr. William Tweedie in the chair. Over 500 members were present. Mr. Henry J. Phillips, the secretary, read the annual report, from which it appeared the gross receipts for the year were nearly £100,000 in excess of those of the preceding one, having amounted to more than £257,000. This increased the total receipts of the society to £930,000. The subscriptions and repayments of advances received amounted to nearly £158,000, being about £58,000 in excess of the previous year. The sums received on deposit at 5 per cent. interest amounted to £57,300, being about £22,000 in excess of the preceding year. The cash advanced upon houses during the year was nearly double that of the previous year, and amounted to £178,950. The amount remaining out on mortgage of houses and land at the close of the year was £345,600. The total sum advanced on houses since the commencement of the society had exceeded £550,000. After providing for expenses of management, and writing off all losses on properties sold, the directors had been enabled to appropriate profit to investing shareholders at the same rate as heretofore—viz., 7½ per cent. per annum on the subscriptions to the credit of the shares in force, and on those withdrawn during the year (in addition to the profit paid on withdrawal), 4 per cent. per annum for the portion of the year expired prior to the receipt of the notice of withdrawal, and also to carry to the reserve or contingent account a sum by which that amount had been increased to £41,947. The chairman, in moving the adoption of the report, congratulated the members upon the highly satisfactory position of the society, and commented upon the facts that the society consisted of between 7,000 and 8,000 members, had issued over 44,000 shares, had advanced money upon nearly 3,000 houses, and at the same time the society had been used to such an extent by members as investors, that over £100,000 had been withdrawn in comparatively small sums; while, at the same time, the amount of subscriptions remaining in the society to the credit of the investing members exceeded £218,000.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

NEW USES OF CORRESPONDENCE.

To the Editor of the Working Man.

Sir,—Could you permit one, not exactly a workman, but yet interested in the movements and progress of working men, to take an occasional part in the interesting discussion arising in your columns? Besides the very useful expression of opinion entertained by working men on subjects of trade interest, and complaints of unfair treatment from which they seek protection through your columns, there are the uses of suggestion. Among your thoughtful and practical readers there must be many with fertile minds, possessed of many highly useful notions, to which they never give expression—because they are not aware that they could possibly be of service to any one. In America the very air teems with inventions, and all sorts of ingenious mechanical ideas, which are known in this country by the familiar name of "Yankee notions," and many of them are remarkable for their ingenuity and practical value. In fact, the Americans have quite a pre-eminence among mechanicians on this very account. There is no manner of doubt that English working men are, as a rule, as clever as American working men; but they have more reticence; they have less push in them; they are less in the habit of utilising their thoughts; they do not put them to account, nor make money of them, nor run to the patent agent with them, nor write to the newspapers about them, as the acute, lively, bustling, wide-awake, adventurous, "go-ahead" nephews of Uncle Sam do. But we certainly might have something of this with great advantage in England. In one way, which I hope you will think unobjectionable, which I am sure would be practically useful, this might be done through the medium of your paper, the Working Man. It is this:—

Working Men's Exhibitions are being constantly opened. You have remarked that in these exhibitions there is observable a deficiency of inventive power among the contributors. I think, upon reflection, that this is true, and I am sure it is remediable; and this has set me writing to you now. My idea is, that workmen, having observed a want of one kind of invention or other, might write to you, and say what article it is that they think could be supplied. These suggestions would meet the eyes of a number of clever mechanics, who could undoubtedly invent a thing wanted, when they know what it is that is wanted, but who would never think of it to the day of their deaths if left to themselves. The power of conceiving and contriving are very different gifts. Those who can conceive cannot always execute, and those who can contrive cannot always conceive. Now, if your columns were used for the purpose of suggestion to mechanics, we should soon have very superior industrial exhibitions to any we have now.

Take an example (a more successful one might be given, but it will illustrate my meaning). All who have visited recent Royal Agricultural Exhibitions, or ordinary provincial Agricultural Shows, have seen exhibited on the stalls a variety of meat-chopping or sausage machines. These are very useful in families which can afford to buy them, and where meat is consumed largely. But a machine much cheaper as regards expense of production, and more useful wherever bread is eaten—and that is everywhere—might be produced: I mean a crust-crushing machine. Perhaps a crust-grinder would more accurately express what I am thinking of. Neither a sausage, coffee mill, nor a meat-chopping machine would grind crusts. A flour mill would not answer. Perhaps a pea mill would—but I know of no portable pea mill.

In the families of the poor, as well as the rich, crusts are always unpopular, and shirked by young and old. It is true, a thrifty housewife will attempt the consumption in milk and broth, but this is also not always successful. The juvenile appetite will express resentment at continual broths and sops. Then there are those disagreeable "end-bits" which have a perverse doughy consistency which very few town children can be got to eat, and always do it under protest when they do consume them. It is supposed by weak-minded persons that the crusts and "oughts" can be got rid of by soaking and beating them up into bread puddings. The soaking is possible, but it is seldom more than half done, and the beating up is always a failure. Bread-pudding is always remarkable for its doughy lumps. The London eating house pudding has this peculiar malady; but if a crust-grinding machine were available for family use, all crust and neglected pieces of bread could be allowed to lie by until they were perfectly stale, hard, and dry. The dryer the better for use—the staler the better for digestion. They could then be easily broken with a hammer or flat iron, thrown into the crust-grinder, and turned into a bread powder as fine as rough-ground rice or oatmeal, which a little hot water, sugar, and milk would convert into a pap for infants, as nutritious as Robb's biscuits, or into puddings, into which the judicious admixture of an egg would make as nice as cheese-cakes. The mechanic who made a crust-machine of the kind I have described, cheap, easy to use, simple to fasten, safe to open and shut, convenient to keep clean, and portable to put away, would obtain the prize medal of the first industrial exhibition where it is shown, the thanks of all poor mothers and little children, and no doubt a good price for the invention from some of the purveyors of domestic machines. I could describe several other things that are wanted, and easy for an ingenious mechanic to produce, quite as useful and far more merciful in their applications.—I am, Sir,

An Overlooker.

WAGES OF SHIPWRIGHTS.

To the Editor of the Working Man.

Sir,—As a subscriber to your long-wanted and valuable Journal, I noticed in a recent impression a letter upon co-operation, by "A Blackwall Shipwright," finishing with a most fallacious assertion, which, if permitted to go uncontradicted, will be productive of immense injury to a respectable body of industrious artisans. I am requested respectfully and politely to suggest to you the propriety, Mr. Editor, by a number of shipwrights, of a direct contradiction to "A Blackwall Shipwright's" statement, that shipwrights earn from 7s. to 13s. and upwards per day. I assure you, Mr. Editor, that, of my own knowledge, at this present time there are many steady men who have been one, two, three, ay, and four weeks out of employ, and I could with truth say more. It is but within the last month that shipwrights have claimed 7s. per day, by a deputation of workmen from the Shipwrights' Provident Union, who waited upon the builders, stating that the high price of provisions and house-rent required that 7s. per day should be the standard wages for the future, and to which—to their honour be it stated—they unanimously assented. Mr. Editor, we earnestly hope that you will be kind enough to give this a corner in your widely-circulated Journal.

A Blackwall Shipweight of Thirty Years'
March 6th, 1866. Experience.

THE CAMDEN TOWN WORKING MEN'S CLUB AND INSTITUTE.

To the Editor of the Working Man.

Sir,—I shall be glad if you will allow me to correct an error into which our excellent friend the Rev. H. Solly has fallen in his remarks upon the Camden Town Club in your last issue. Mr. Solly says "The only ground of apprehension with regard to this Club, *but it is a serious one*, and requiring constant attention, is, that it has been so good that the tradesmen in the neighbourhood use it, and the class of working men by whom these clubs are especially needed is not so fully represented as one could wish."

This is a grave objection; but Mr. Solly must have misunderstood the information upon which his remarks are grounded, as the following analysis of the committee of the club will show that the governing body is composed mainly of working men:—Three journeymen upholsterers, one carriage-maker, one bookbinder, one cook, one fret-cutter, one glass-painter, one tinplate-worker, two pianoforte makers, three printers, one telegraph machinist, one tailor, one Press reader, one china-ware man, one painter, and five clerks.

March 9th, 1866.

TO CORRESPONDENTS.

H. B. Thorne.—Having obtained the colouring matter by the processes we have given, you can add as much whiting to it as you please, but of course the more you add the weaker or paler will be the colour. There is no cheaper mode of obtaining the pink than that we have given, as it abstracts all the colouring matter of the wood at the least cost.

G. B. B.—The double bond executed by a single surety would be a fraud upon the society seeking protection by it. The simplest and best security is for the treasurer to hold paid-up shares to the amount of the security demanded of him.

The Bridgeton Working Man's Club.—In No. 7 of the Working Man, we stated that the Club was held at Paisley, instead of Glasgow. The correspondent who favoured us with the notice, sent it in the form of a cutting from a Paisley newspaper; and that led us into the error.

Amateur Architect.—We hope that we shall soon be in a position to put the subject of cottage architecture in a comprehensive manner in the Working Man.

A Working Man.—Every cart conveying coals to a retail customer, must carry proper weights and scales, and the carman is bound to weigh the sacks if called upon. The penalty for neglect or refusal is forty shillings.

A Mechanic (Sunderland).—The address given is in London.

Locomotive.—The motive power is obtained instantaneously by the sudden liberation of the ammonia gas condensed in the water, upon the application of heat. A coal fire is not necessary; coke or gas as fuel would be preferable, as yielding no smoke. Ammoniacal gas is obtained by heating a mixture of hydrochlorate of ammonia and quick-lime.

A Carpenter.—There is no special work on the subject; we think it could be easily constructed.

S. Hartley.—Shagreen is a leather prepared from the skin of the horse, ass, or camel; the only part fit for the purpose is taken from the lower part of the back, from the tail to the middle of the back-bone. The peculiar asperities of this leather are given to it by pressing in the hard seeds of the *Chenopodium album*, which, when the leather is afterwards dried, are beaten out.

Jason.—The best varnish for your purpose is caoutchouc dissolved in benzine.

W. H.—There are several other calculating machines beside that invented by Mr. Babbage.

O. P. Q.—Barometer scales are silvered by rubbing the cleaned metal with the following paste:—Chloride of silver, well washed, 3 parts; cream of tartar, 1 part; corrosive sublimate, 1 part; sea salt, 72 parts; sulphate of zinc, 72 parts; and a little water.

C. Y. W.—By the addition of 10 per cent. of treacle to the glue, and 2 per cent. of tannic acid dissolved in alcohol added to the warm solution of gelatine, the desired elasticity and toughness for moulds may be obtained.

G. Ascoton.—To give the information you require would require a treatise for which we have no room. If you have access to a library, consult an encyclopædia.

A Journeyman Dyer.—Make a solution of alum about ¼ lb. to the gallon of water. Soak the articles in it for six hours, and hang up smoothly on lines to drain and dry. Then sponge all over carefully with clean water, and colander if desired. A little of a solution of washing soda added to the alum solution is an improvement, but renders the after operations more troublesome.

R. S.—Blue ink is usually prepared by dissolving Prussian blue in oxalic acid. The best mode of proceeding is as follows:—Dissolve 10 parts (ounces or pounds) of sulphate of protoxide of iron in a large quantity of water; boil it, and add sufficient nitric acid to sesquioxidise all the iron, which may be recognised by the liquid no longer turning blue upon adding it to a solution of yellow prussiate of potassa, containing 10 parts of the salt, and allowing the deposit to settle. After decanting the supernatant liquid, throw the deposit on a filter, wash it with cold water, and leave it to drain until it can be easily removed from the filter with a knife. Then, without drying it more, mix it in a Wedgwood's mortar with 2 parts of oxalic acid in crystals, and allow the reaction to operate for an hour; then add, little at a time, 400 parts of water. We thus obtain a deep blue solution, in which, even after a long repose, no deposit appears. It is as well to note that this blue ink must not be brought into contact with ordinary black ink, nor must a pen soiled with black ink be dipped into it.

P. Hastie.—For a plastic composition for joints of tubes, cocks, &c., take fresh clay that can be worked by the hand, roll it out and cut into strips as thin as possible, and lay it out to dry until all the water is completely evaporated. Then put some pulverised marble into a glazed vessel, and cover it with hydrochloric acid. In about twelve hours the marble will be all dissolved. The vessel must be kept in the open air, so that the acid vapours may not cause any damage. The marble being completely dissolved, put into the solution a portion or the whole of the dried clay, then knead the whole together into a soft paste, after which leave it in the solution for about three days; knead it up again, and it is then ready for use. This composition always remains soft and plastic.

THE LONDON CENTRAL

Painters' Hall Company,

LIMITED.

Incorporated under "The Companies' Act, 1862," whereby the Liability of each Shareholder is limited to the amount of his Shares; and no Shareholder will be allowed to take more than Ten Shares.

CAPITAL, £2,000, IN 2,000 SHARES OF £1 EACH,

WITH POWER OF INCREASE.

Deposit on Application, 2s. 6d. per Share, and 2s. 6d. on Allotment. No Call will exceed 2s. 6d. per Share, or be made at less intervals than One Month.

Directors (pro tem.).

Bankers.

BIRKBECK DEPOSIT BANK, 29, Southampton Buildings, Chancery Lane.

Solicitor.

Secretary (pro tem.).

WILLIAM HENRY TOFTS.

Temporary Office.

39, UPPER JOHN STREET, FITZROY SQUARE.

OFFICE HOURS: 7 to 9 P.M.; Saturdays, 3 to 5 P.M.

This Company is established for the purpose of Leasing or Building a Painters' Trades Hall, Library, and Reading Room, for the use of Trade, Benefit, and other Societies.

PROSPECTUS.

Seeing the great evil of having our meetings at public houses, and the necessity of improving our condition, both morally and socially—conscious of the difficulties and failures that have attended all former efforts in this direction—we have taken a broader basis as the foundation of our work, and a fixed determination that no effort shall be wanting on our part to ensure its success.

To remove the existing evils of public house meetings, the London Central Painters' Society members have formed a Company, on the principle of limited liability, for the purpose of leasing or building a hall in a central part of London, such building to consist of a hall capable of holding 1,000 persons seated, library, and reading room, with large rooms for the use of various societies to hold their meetings in, with committee and refreshment rooms attached, lavatories, &c.

The calls are made easy, to enable working men to take up shares. All are invited to co-operate in the scheme; and, to prevent monopoly, no shareholder will be allowed more than ten shares.

The promoters of the Company are, on allotment, to receive the money outlaid for the promotion of the Company, and no further remuneration until 10 per cent. has been divided amongst the shareholders; any profit over and above this rate to be divided amongst the shareholders and promoters, in proportion of two-thirds to the shareholders and one-third to the promoters.

For the many benefits it will confer upon them, it behoves the working classes generally to devote their entire energy to its advancement, and take every opportunity of making it known and appreciated; as we advance in years, numbers, and intelligence, great and numerous will be the advantages which those who come after us may acquire through our earlier exertions.

The promoters, in bringing this scheme before the working classes, feel the greatest confidence that, if supported by those it is intended to benefit, it will prove one of the greatest advancements of the age, both morally, socially, and financially, and will ultimately produce a large dividend to the shareholders.

FORM OF APPLICATION FOR SHARES.

To be retained by the Bankers of the Company.

No.

To the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED.

GENTLEMEN,—I have paid to your credit at your Bankers the sum of £ , being a deposit of 2s. 6d. per share on shares in the above Company in respect of such shares, or in respect of any less number you may allot me, and I agree to pay the further sum of 2s. 6d. on allotment thereof, and the instalments according to the terms of the Prospectus.

Name in full,

Residence,

Profession or Trade,

Dated this day of 186

If it is not convenient to make the deposit with the Bankers of the Company, the form may be sent by post to the Office of the Company, accompanied by a Crossed Cheque or Post Office Order for amount of the deposit, which will be paid into the Company's Bankers, and the Receipt returned by post to the Applicant.

BANKERS' RECEIPT.

To be signed by the Bankers and returned to the Applicant.

Received this day of 186 , of for the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED, the Sum of on account of an application for an allotment of Shares in the undertaking.

The Trade Supplied. [34

The Original Chlorodyne, Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c.

Earl Russell communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chlorodyne.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chlorodyne engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ½ oz., 1s. 1½d.; 1¼ oz., 2s. 9d.; 10 oz., 11s.; 20 oz., 20s.

Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [37

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength.

Sold by Chemists, Confectioners, &c., in most Towns. [4

Government of South Australia EMIGRATION DEPARTMENT.

FREE PASSAGES are granted to South Australia, in vessels chartered expressly by H.M. Emigration Commissioners, to PLOUGHMEN, farm servants, miners, masons, bricklayers, wheelwrights, blacksmiths, sawyers, carpenters, gardeners, grooms, collar and harness makers, country shoemakers, &c.

ALSO TO SINGLE FEMALE DOMESTIC SERVANTS.

Further particulars and forms of application may be obtained at the office of the Emigration Agent for the Government of South Australia, 3, Copthall Court, London, E.C. [5

Paris Exhibition, 1867.—

All demands for SPACE from intending Exhibitors must be sent, marked "Paris Exhibition," to the Secretary, Science and Art Department, South Kensington Museum, London, W., on or before 28th February, when the lists will be made up.

William Chambers, Heraldic Chaser and Embosser, 4, FOLEY STREET, PORTLAND PLACE, W.

Honourable Mention, Great Exhibition, 1851; *Honourable Mention*, 1853, *New York.*

Working Men's College.—

BUILDING FUND.—Subscriptions are requested in order to allow the Proposed Buildings to be begun in the Spring. The College is self-supporting; but increase of numbers has made additional Rooms necessary. Estimated cost, £3,000. Already subscribed, £780, including £26 5s. from the PRINCE of WALES, and £278 from the Principal and Teachers. See fuller statements in current numbers of *Cornhill* and *Macmillan's Magazine*. Subscriptions received at the College, 45, Great Ormond Street; the London and County Bank, Oxford Street; and by the Treasurer, E. B. Litchfield, Esq., 4, Hare Court, Temple.

The London Provident Institution, 2 and 3, Blomfield Street, Moorfields, E.C.

Established A.D. 1816. Savings Bank Certified under the Act of 1863. Open Daily. Office hours 11 to 3. Saturday, 11 to 1 and 5 to 8. Sums not exceeding £10 are paid to depositors, without previous notice, on Monday, Wednesday, and Friday. The rate of annual interest allowed to depositors is £3 per cent.

FRANCIS E. GREENAWAY, Secretary.

St. Marylebone Bank for Savings, 76, Welbeck Street.

Savings Bank certified under the Act of 1863. Open daily from 10 till 3, and on Monday and Saturday evenings, from 6 till 9 o'clock.

Picture Frames for the Children in the Wood, given with the *Illustrated London News*.

Handsome gilt frames, glass, and back, 3s.; by the dozen, 2s. 6d. Maple and gilt, 5s.; by the dozen, 4s. Every description of Prints and Frames kept in stock. The Trade and Country Dealers supplied with maple and gilt Mouldings at the lowest prices. List of prices, 2 stamps, at George Rees, 57, Drury Lane (near the Theatre). [28

A MARVEL OF CHEAPNESS.

The Shilling Drawing Case,

Complete; containing Six Progressive Studies, after J. O. Harding, a Book of Whatman's Superfine Drawing Paper, Two Academy Drawing Pencils, and India-rubber. Post free for 14 stamps.—PACKER and GRIFFIN, 35, Poland Street, Oxford Street, W. Schools, the Trade, and Shippers supplied on advantageous terms. [29

THE "CITY" HAT COMPANY'S

Only retail address is 109 and 110, Shoe Lane, eight doors from Fleet Street.

The celebrated Paris Napped Hats	3s. 6d.	each.
Superfine quality	6s. 6d.	"
Best Hats (these are unequalled)	9s. 0d.	" [33

National Institution for Diseases of the Skin, 10, Mitre Street, Aldgate.

Physician, Dr. Barr Meadows, 8, Hinde Street, W. Open on Monday and Thursday Evenings from Five till Eight, and on Wednesday and Saturday Evenings from Seven till Nine. Free letters are available for necessitous applicants. THOMAS ROBINSON, *Hon. Sec.* [36

City of London Working Classes' Industrial Exhibition, Guildhall.

OPEN FROM 10 A.M. TILL 10 P.M.

MUSIC ALL DAY.

CLASSICAL MUSIC ON FRIDAYS.

Admission, every Morning, 1s.; Evening, 6d.

TRANSFERABLE SEASON TICKETS, £1 1s.

Surplus funds to be appropriated to the establishment of a Free Public Library.

William Ramsey, *Hon. Sec.* [30

Offices, Guildhall.

The London and General Permanent Land, Building, and Investment Society.

Enrolled pursuant to 6 and 7 Wm. IV., cap. 32. Shares £40. Monthly Subscription, 5s. Entrance Fee, 1s. per Share. Temporary Offices, 12, Buckingham Street, Strand, W.C. Chairman of Directors, THOMAS HUGHES, Esq. M.P., 9, Lincoln's Inn Fields. Surveyor, C. Stuart Barker, Esq., 12, Buckingham Street, Strand, W.C. Managing Director, W. R. Selway, Esq., 19, Manor Road, Walworth, S.

Shares may be taken at any time. No back payments. Sums of not less than One Pound received on Deposit. Interest not less than 5 per cent. guaranteed. Persons wishing to buy houses can have money advanced immediately, to be repaid by easy monthly sums. [24

£20,000 ready to be advanced by the Temperance Permanent Land and Building Society, on Freehold or Leasehold Property, for any period of years not exceeding fifteen, the mortgage being redeemable by equal monthly instalments. Interest (in addition to a small premium), 5 per cent. on the balance each year. Apply to

HENRY J. PHILLIPS, Secretary.

Offices, 34, Moorgate Street, London, E.C.

Note.—More than half a million pounds sterling have been advanced upon house property alone. [25

How to Purchase a House

For Two Guineas per Month, with Immediate Possession, and No Rent to Pay. Apply at the office of the Birbeck Building Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO PURCHASE A PLOT OF LAND for 5s. per Month, with Immediate Possession, either for Building or Gardening Purposes. Apply at the office of the Birbeck Freehold Land Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO INVEST YOUR MONEY WITH SAFETY, at £5 per Cent. Interest. Apply at the office of the Birbeck Deposit Bank. All sums under £50 repayable upon demand. Current Accounts opened similar to ordinary Bankers. Cheque Books supplied. All cheques exempt from Stamp Duty.

Office Hours from Eleven till Five daily; on Saturdays from Eleven till Two, and on Monday evenings from Seven till Nine.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to

FRANCIS RAVENSCROFT, *Manager.* [26

The Planet Permanent Building and Investment Society,

Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. THE SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [27

EASY MODE OF PAYMENT.

THE PAVIOR'S RAMMER.

THE BOX LIFT.

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

THE last example that I shall give of labour wastefully employed, is that of "navvies" wheeling materials in barrows up a slope, "tipping" the barrows, and returning with the "empties" for a fresh load. This, I am informed, is a kind of work which is considered to have been brought to great perfection on English railway works, and yet, on investigation, I think it will be found to be one of the clumsiest methods ever invented for employing the labouring force of man, as the work wasted in useless labour bears so large a proportion to the work expended on the actual transport and elevation of materials.

A man thus employed in "tipping" barrows, runs up a slope of 1 ft. in 12 ft., empties, or "tips" his barrow, and returns with it empty for a fresh load.

According to the best authorities, the work done is 519 ft.-lbs. per minute, or 139 ft.-tons per day of 10 hours' labour. The "navvy" so employed is placed under the same unfavourable conditions as the "hodman," for he is obliged to lift and bring down, not only his barrow but his own weight, at every journey that he makes.

The weight of his barrow (iron wheel) is 84 lbs.		
The weight of his body and clothes .	160 ,,	
		244 lbs.
The weight of his load is		336 lbs.

* Continued from page 150.

The weight of load is thus found. From Mr. Lane's valuable observations on the Birmingham and Oxford Junction Railway, it appears that each cubic yard of earth weighed $1\frac{1}{2}$ tons, and as the barrow carries one-tenth of a cubic yard, we have, by the chain rule, the following:—

	1 Barrow load.
10	1 Cubic yard.
10	15 Tons.
1	2240 lbs. avoir.
	336 lbs.

Assuming the work spent in descending as half that spent in ascending, we find—

Work wasted (in each journey) . . .	366
Work done	336
Total	702

As the total work done in the day is 139 ft.-tons, it is easy to see that the work wasted in the day is—

$$139 \times \frac{366}{336} = 151 \text{ ft.-tons.}$$

Adding to this the useful work, we find—

Work wasted	151 ft.-tons.
Useful work (paid for) . . .	139 ,,
	290 ft.-tons.

The following example, taken from actual observation, serves to show how estimates of labouring force should be made under different circumstances.

On watching the paviors of Dublin at work, I found that they made 78 blows of the rammer in 2 min. 45 sec., and then rested for 3 min. 30 sec. Their rammers weigh 5 st. 9 lbs, and are lifted at each stroke to the height of 16 inches. I also learned, on inquiry, that 10 hours was the ordinary period of their daily labour. Let us calculate, from the foregoing data, the work done by these men in the day of ten hours.

The time of labour is to the time of rest as 2 min. 45 sec. is to 3 min. 30 sec., or as 165 to 210. Hence the time of labour is to the whole time of labour and rest as 165 to 375.

Therefore, in the day of 10 hours, the number of minutes of labour is—

$$10 \times 60 \times \frac{165}{375} = 264 \text{ minutes.}$$

But in $2\frac{3}{4}$ minutes 5 st. 9 lbs. (or 79 lbs.) are lifted 78 times, through 16 inches (or $1\frac{1}{3}$ ft.).

Hence the work done in $2\frac{3}{4}$ minutes is—

$$79 \times 1\tfrac{1}{3} \times 78 = 8216 \text{ lbs.}$$

and the work done in the whole day is—

$$8216 \times \frac{264}{2\frac{3}{4}} = 788{,}736 \text{ lbs. lifted through one foot.}$$

Dividing this result by 2240, the number of pounds in one ton, we find—

Daily work of pavior = 352 ft.-tons.

The operation of piledriving, consisting as it does in the lifting of a weight which is afterwards allowed to fall, presents many analogies to paviors' work; but it is found, on trial, to be a more wasteful mode of employing the labouring force of men, probably on account of the greater rapidity with which the work is required to be done. I take

the following examples from Coulomb and Lamandé:—

Coulomb observed that in the ordinary operation of piledriving, each man lifts 19 kilogrammes of the ram; at every pull the ram is raised 1·1 mètre; the men make 20 pulls in 1 minute, and after 3 minutes of exertion, rest for as long a time, and then begin again: thus, their daily labour lasting 6 hours, the duration of fatiguing exertion does not exceed 3 hours. The weight lifted through 1 mètre, or work done, in this case is—

$$\text{Work done} = 19 \times 1{\cdot}1 \times 20 \times \frac{6 \times 60}{2} = 75240 \text{ kilog.-mètres.}$$

The rule for converting kilog.-mètres into foot-tons is to divide by 311. Hence—

$$\text{Work done} = \frac{75240}{311} = 242 \text{ ft.-tons.}$$

Lamandé, the celebrated architect of the bridge of Jena, found that 38 labourers, working 10 hours a day, made in each hour 12 efforts, each of 30 pulls; the ram weighed 587 kilogrammes, and was raised through 1·45 mètres at each stroke. The work done in this case is—

$$\frac{587 \times 1{\cdot}45}{38} \times 10 \times 12 \times 30 = 80635 \text{ kilog.-mètres.}$$

Dividing this result, as before, by 311, in order to convert it into foot-tons, we find—

$$\text{Work done} = \frac{80635}{311} = 260 \text{ ft.-tons.}$$

It is worthy of remark, that the number of pulls given each day in Coulomb's and Lamandé's observations is the same, viz., 3,600, although the hours of labour are in the proportion of six to ten.

The circumstances under which different kinds of labour are performed influence materially the total day's work, as I have already shown in several instances. As a further instance of this important principle, I shall compare the results of the "box lift" and the "swing lift," as used on the Oxford and Birmingham Junction Railway.

The swing lift consists of a balk fixed vertically in the ground, in such a position that the ends of a long lever, by which it is surmounted, can be alternately swung round to the same stage. "The lever," in the case considered, "was constructed of a strong timber, trussed by means of an iron rod, strained over a short king-post of hard wood. The lever was balanced on its centre by an iron sling, and was free to move in an horizontal plane by means of a strong iron pivot working in a cup on the top of the vertical balk. Each end of the lever had an iron hook, to which the barrows containing the materials and the counterpoise, and ropes, by means of which the men below guided the loads to their proper destination, were attached. The men, called *riders*, descended by their gravity in the empty barrow, thereby lifting the weight at the other extremity of the lever, and ascended again by ladders without carrying up any material." *

With the aid of the swing lift thus employed, it was found, as the result of more than one year's observation, that

The work done was 1046 ft.-lbs. per minute;
Or . . . 280 ft.-tons per day of 10 hours.

Much time was necessarily lost, in the arrangement just described, in swinging the lever from side to side; and the work obtained from each man's labour was not so great as it should have been, nor so great as was readily obtained by the "box lift," which proved to be a much more economical contrivance.

The box lift consisted of four upright beams, connected at the top by cross braces; a wheel was carried by these braces, and round it was passed a rope, at each end of which a box was attached. The material was raised in each of the boxes alternately by the weight of men descending in the other.

The illustration will serve to give an idea of the principle of the box-lift.

The work done per man per day, by means of this contrivance, was found to be—

Work done . 1510 ft.-lb. per minute.
Or . . . . 404 ft.-tons per day of 10 hours.

From the preceding facts, we can form an estimate of the amount of work done by labouring men engaged in different occupations, and of the work wasted in each kind of labour unprofitably. I have stated in each case the average result of the day's work, but it is to be remembered that men are capable, on a "spurt," of doubling, or even trebling, the foregoing results for a day or so, as may be proved by the following examples:—

1. A friend of mine, weighing in his clothes, 14 stone, ascended Monte Rosa (9,000 ft. in 9 hours), and descended again the same day.

The work done in this case was, in ascending—

$$\frac{14 \times 14 \times 9000}{2240} = 787 \text{ ft.-tons.}$$

Allowing half as much work to be done in descending, we find—

Total day's work = 1181 ft.-tons.

2. Captain Coignet invented (1835) a box lift, to be used in forming earthworks by a single soldier; and showed that one man, using his lift, could raise his own weight (70 kilos.) through a height of 13 mètres, 310 times each day. From these data we find—

$$\text{Work done in one day} = \frac{70 \times 13 \times 310}{311} = 910 \text{ ft.-tons.}$$

3. Prisoners, also, working under compulsion, can be made to use the tread-wheel for 8 hours a day, and thus produce 834 ft.-lb. of work.

Examples like the foregoing are, however, rather to be regarded as feats, showing what a man can do for a short time, but it is certain that a few such days of labour would inevitably break down the strongest constitution, and render the labourer incapable of any work at all for a long period.

If we collect together into one table all the preceding results, we shall obtain a good view of the work done per day by different classes of labourers, and of their comparative economy.

Table showing the Work Paid for *in different modes of employing Human Labour.*

Kind of Labour.	Hours of Labour.	Work Paid for.
1. English Treadwheel .	4 hours.	417 ft.-tons.
2. Norwegian Treadwheel	4 ,,	390 ,,
3. Hodman	6 ,,	131 ,,
4. Shovellers	10 ,,	125 ,,
5. Tipping a Wheelbarrow	10 ,,	139 ,,
6. Paviors	10 ,,	352 ,,
7. Piledriving (a) . . .	6 ,,	242 ,,
8. Piledriving (b) . . .	10 ,,	260 ,,
9. Box Lift	10 ,,	404 ,,
10. Swing Lift	10 ,,	280 ,,

The prices paid for different kinds of labour in the same district, ought to be proportional to the above results.

Dr. Watts's "Facts of the Cotton Famine."

Dr. John Watts, of Manchester, has published a valuable book, which he entitles the "Facts of the Cotton Famine." We purpose to speak of this book, but we have a presentiment that we shall scarcely now reach to the merits or pith—we were going to say "marrow"—of the book, but dislike that boiled-bone simile. The preface will, we foresee, delay us on our way.

In it the author tells us that he is dissatisfied with his work, and that if it had to be re-written he could materially improve it. What is the good of telling the reader this, unless to disincline him to read the book? The reader cannot judge the truth of what is said, and therefore the information is useless. The reader has not gone over the same ground; he has not had the same material before him; he has no idea how it could be better presented; and if he supposes a better treatment possible, he can only wish that the author had acted on his better knowledge before publishing his book. A sculptor or painter may very properly and modestly own to the select circle of art critics that he is sensible of deficiencies, and has not done his best. An author may say this to reviewers, who, by the way, will never forgive him the confession, but to the general public it can have no meaning. Indeed, it violates the very theory of prefaces to interpolate so irrelevant an intimation in it.

We take it for granted that everything appearing in a book should appear there with a definite purpose; and if it has no purpose in it, it has no business there. If, therefore, we find a preface to a book, we take it for granted that there is a meaning in it, and that the author wrote it because he had something special to say in it. In these days, when books are multiplied, the public should be more than ever guarded against mere words, and none should be employed except they make a definite addition to human knowledge. There are authors who commence a preface by telling the reader that it is never read. If the author believed himself, he would say no more and omit his preface. No doubt there are readers who habitually skip prefaces; there must, therefore, have grown up a want of confidence in them. There are, indeed, authors who tell us that their prefaces were written after the book was composed. This only proves that many authors do not know what they are going to write about, and their prefaces, instead of being explanations of their design, become apologies for their non-fulfilment. Readers who discover this have no relish for the insipid confession: they skip over the introduction without zest, and dip into the chapters without hope. Perhaps the most perfect preface will always be one written after the work is finished. Most authors of capacity find their subject grow upon them. They discover new applications of the principle discussed. What they thought to be very limited proves to be very wide. What they thought to be easy turns out very difficult. The proofs they thought sufficient prove inadequate, establishing too little, or, what is equally unsatisfactory, demonstrating too much. The author finds himself wiser when he has thoroughly worked out his subject. Under these circumstances, he can give a better introduction to the reader when he has finished his book than he possibly could before he began it. Dean Graves tells us, in his Eloge on the late Sir William Hamilton, that Professor MacCullagh would ponder an incredible time over a mathematical demonstration, until all its parts assumed a symmetry in his mind, before he would commence a delineation of it. The late Sir William Hamilton himself had this patient faculty of thoroughly mastering his subject before committing himself to its elucidation. Such authors, and such alone, are competent to write their prefaces before writing their books. But whether the preface is written before or after is of small consequence, providing it answers its purpose when executed.

We have pleasure in saying that Dr. Watts's book is much better than his preface would lead any one to suppose. He was a member of the Lancashire Central Relief Committee, and therefore fully conversant with his subject. It occurred to him that the great social, political, and commercial facts attending the unprecedented convulsion of our gigantic cotton trade needed some permanent record, and he went about suggesting to gentlemen whom he thought competent to make it that one or other should undertake the work. The author confesses that he was "surprised" to find himself, in each case, requested to make the record wanted. But the public familiar with Dr. Watts's name will not be surprised that competent judges of the history needed should agree in selecting him to write it. Dr. John Watts might properly appear in our series of sketches of "Men who have risen from the Ranks," and therefore he was well qualified to record, as he was personally well fitted to deal with, the facts, incidents, and persons of the cotton famine. He has produced a book of great interest. Unfortunately, the title is as dry as science could make it, and gives to the general public and ordinary reader very little idea of the animated and reliable history the author has produced. His book is a permanent exposition of the social life and political character of Lancashire, and of the public action of the English nation during four memorable years. It relates to the conduct of working men under circumstances of trial in which they were never placed before, and out of which they came with an amount of credit the working class never won previously. Lord Palmerston was so struck by it that he would have given them all the franchise, had it been possible to introduce a bill for their especial benefit. We trust the title of the book will not prevent it getting into every library to which working men have access. It is a romance of Industry, and all true. Its facts are as good as fictions, and much more useful. The author has devoted to it the leisure of twelve months. We are glad he has not attempted to re-write it.

* "Proceedings of Institution of Civil Engineers."—Vol. xi., p. 79.

There is a freshness of thought in it, a picturesqueness of description, a certain impulse in the book, which is almost sure to have disappeared had the author operated upon it with a view to that technical strictness at which he has aimed in former works. He has never written a book before half so large nor half so well. We learn from the preface, and from the preface only (for the book has no formal dedication, as it ought to have), that it is inscribed to all those who contributed to the funds of Lancashire Relief Committees, and to all who assisted in the distribution of those funds. Should all the persons here alluded to buy the Doctor's volume, it will have a large and well-deserved sale. If the book should become known to them all, as it ought to be, we have no doubt this will be the case. If it should not, the author may be a loser after twelve months of the most laborious and yet most useful work any public writer could undertake on behalf of social progress. In a future article we shall endeavour to do some justice to the contents of the volume.

The Materials of Co-operation.

The "beginning of a store," as we have already explained, is of course a question of capital, and we have explained how that capital has usually to be raised. Though no store can flourish without capital, it does not follow that it will flourish with it—that depends upon the persons who employ it. We will therefore describe the kind of persons most likely to carry on a store successfully. The materials of a Co-operative Store consist of men as well as money, and the quality of the men is of no mean importance. The early members who originate and establish a store determine its character for the future. For instance, if they insert a clause in their first rules to the effect that a portion of the profits shall be devoted to educational purposes, no future members ever think of abrogating such a rule. Most come to experience the benefits of it; all have seen the good effects of it. The credit of the store has been raised by it; and we have never heard of a case in which the members of a Co-operative Society have ever gone back and repealed so wise and honourable a rule. Neither, on the other hand, have we ever heard of a case in which a society, founded without such a rule, ever instituted it. People who have never tasted the value of knowledge care very little for it, and will rarely, if ever, consent to pay for it. On the other hand, men who have acquired knowledge know that it is power as well as pleasure, and will never part with it. There never was an intelligent man who would, if he could, go back into the helpless, despicable state of ignorance. Once, however, let a store be founded on the basis of paying all the profits over to the members, the ignorant and the selfish will always force the continuance of the same state of things. They will look upon money taken for educational purposes as a robbery of their profits, and will say, "Let those members who want knowledge go to mechanics' institutions, and beg or borrow their knowledge of any who are generous enough to give it or lend it, but let them not diminish our profits by a farthing in the pound for that purpose." If we mistake not, this is the history of the great Halifax Industrial Society. It rivals the Rochdale Equitable Pioneers in the number of its members; it makes enormous annual sales; it reaps colossal profits; but it has no educational fund. The Rochdale Pioneers have. After paying quarterly—(1) expenses of management; (2) interest due on all loans; (3) an amount, equivalent to ten per cent. of the value of the fixed stock, set apart to cover its annual reduction in worth, owing to wear and tear; (4) dividends on subscribed capital of the members; (5) such sum as may be required for extension of business; (6)—last but one, but not least—two and a-half per cent. of the remaining profit, after all the above items are provided for, to be applied to educational purposes; (7) the residue, and that only, is then divided at Rochdale among all the members of the store in proportion to the amount of their respective purchases during the quarter, varying from 2s. 2d. to 2s. 6d. in the pound. This proportion in other societies is 8d. in the pound, or 1s., or 1s. 6d., or 2s., or 2s. 4d., in some cases 2s. 6d. and 2s. 8d., according to the economy, and wisdom, and magnitude of the transactions of the store. No case has been reported in which the profits have reached 3s.

It is, therefore, of importance that the beginners of a store should be men who understand Co-operation. In the four years, from 1861 to 1865, the Rochdale Pioneers appropriated the large sum of £1,841 3s. 10d., or nearly £2,000, to educational purposes. Had they not began to do this at the first—that is, to make appropriations of this kind in the infancy of the store—they could not do it now. The man who learned to carry a cow began first by carrying the calf, and carrying it every day his strength grew by the exercise, and at last he carried the cow as easily as he once did the calf. In the same way the society that intends or hopes to carry the educational cow must begin with the calf. The illustration does not spoil the fact; for whether it be a cow, or a library, or a news-room, both are good for consumption: the cow for the body, the books for the mind.

The first intelligent and earnest members of the Co-operative Society should, therefore, look out for persons similarly minded to join them. Men of the working class are best, because there is work to be done, and they are the most likely to do it. Men of the working class are best, because there is profit to be made, and they need it most. Men who have some ambition, who wish to improve their position, are necessary, because they are likely to stick to the society which affords them the means of doing this. Men with some intelligence should be sought, because fools will not make Co-operators. Men of some patience are useful, for success cannot be compassed all at once. Men of some perseverance are required, who will push on over difficulties, or through them (it does not matter which), until success is won. Men who care for the good of others are invaluable, for Co-operation is a scheme for promoting the welfare and profit of all the members; and he who cares most for the welfare of others will hold on the longest, work with the best heart, display the most forbearance with the shortcomings of others, and be of good cheer in the dark days, when profits are low. But men of good nature and good will are the rarest to find. We want leading men who, like the late Mr. Cobden, have meekness without weakness, who never put themselves forward, and who never hold back; who are, nevertheless, always found in the front whenever there is a vacancy there: and there always is a vacancy when the society is confronted by danger or difficulty. Men are wanted who never give offence, and never take it; whose tempers move on a sort of universal joint, and pass out of the way when the angular and cantankerous come in contact with them. In every society there are members whose tempers are rusty, who never move without a creak, whose ordinary talk partakes of the nature of a railway-whistle, whose laughter seems compounded of a groan and a scream, and whose smile, if they relax into one, is only a modified sort of reproof. In competition this kind of thing is never counted as of moment. There naggling is natural; but in Co-operation, where everything is voluntary, a rheumatic temper tells upon the profits, and imparts a chronic tic-doloureux to the whole concern. To use another simile—an officer with a porcupine tongue will prick all the members of a society in three months, and establish a universal smarting in the place. Passing to the botanical kingdom, every one knows that it would be a painful thing to live if all food grew on nettle-bushes; people would give up smelling the rose if thorns always penetrated the face before the fragrance could be inhaled. The qualities of the materials of Co-operation are, therefore, important, and a smaller society of the right men will go farther, last longer, and achieve more, than a larger one of half-informed, disqualified persons.

The Savings Banks Investment Act.—The new Act for amending the law relating to investments on account of savings banks and Post Office savings banks has been issued. The Treasury is now empowered to substitute terminable annuities for capital stock standing to the savings banks' account, and the commissioners may make rules as to payments to the National Debt Commissioners. The Treasury is likewise empowered to cancel capital stock of annuities, and to substitute terminable annuities. The warrants issued by the Treasury to the Bank of England are to be a sufficient authority for the cancelling of the stock. The statute, which has recently received the Royal assent, is to be called "The Savings Bank Investment Act, 1866."

Some Working Men I have Known.

The stock biographies of men who, born to the heritage of hard daily toil, have by their innate force of character raised themselves into notice, and claimed a niche in the gallery of the great ones, by no means chronicle all who have wrestled with the obstacles which impeded their development, and been victors in the conquest. It is not given to all to be masters of song, like Burns; of art, like Palissy or Gibson; of engineering skill, like Stephenson; of critical acumen, like Gifford; or of abstract science, like Ferguson or the elder Herschel: yet these, at first, were all poor or working men, who gained their education by their own efforts—who did battle with pinching poverty, lack of educational means, prejudice of class, and all those lions which stand in the way of men of weaker mould, who "let I dare not wait upon I would."

All, I say, cannot be field-marshals in the army of life; but somewhat lower, yet very honourable grades, have been attained by men once in the ranks, who, while never for a moment despising the labour by which they gained honest bread, were not disposed to consider that working, eating, and sleeping are all that is worth living for. Their daily labour honestly and intelligently performed, they felt themselves to be free citizens of the empire of thought, in which true men take rank according to what they essentially are, quite independently of the conditions of their life.

When the sun shines, it shines for all, lord or labourer; and the precious instincts which make men believe in good and beautiful things, treasure up and nourish the suggestions of universal nature, and cultivate the talents entrusted to their care, are bestowed as impartially as the sunshine. Look into any biographical dictionary, and you will see how little the circumstances of early life have been able to impede the careers of really great men. Real mental energy soon masters them, and makes them even subservient to its will.

I, a working man, with few opportunities of going out into the great world, have not met many famous men; but I have known some who deserve to be famous, or, at least, whose efforts and achievements merit acknowledgment at the hands of their fellow working men.

I have on my little book-shelf at home some of the best authors of the "Augustan age" of English literature, as the early part of the last century was styled. Addison and Pope are especial favourites. I bought the books for a few shillings—not more than I have often known squandered in a single evening by a shopmate, who "liked to enjoy himself"—and many, many evenings of true pleasure have I derived from my crown's worth of literature. But I refer to them now because these authors frequently criticised living persons, veiling their names under such disguises as "Eugenie," "Chloe," "Atticus," &c. To that extent I will imitate them; for some of the originals of my sketches of "Some Working Men I have Known" are still working hard in our very midst, and, modest and unassuming by nature, would be pained at being brought more prominently before the public. Others have passed away, just when their dearest hopes of achievement were on the point of realisation; but they have left behind those who might not wish the sad stories of their lives to be made known in all their details.

Carolus (I will call him) was my fellow-apprentice, younger than I, who accepted my few years of seniority as a reason why he might make me a confidant of his cherished plans. He was a rough, uncouth lad, violent in temper, reckless in his fun, who, in childhood, had been the occupant of the van of the manager of an itinerant dramatic company, and whose first efforts at composition were tremendous melodramas, with no end of assassinations, combats, and deepest dungeons; and who, at the age of thirteen, when I first knew him, had no higher ambition than to see his imaginary heroes tread the stage. Night after night the young boy would sit up almost till morning beamed, to construct sensation scenes and invent sounding dialogue. I was the critic (often, I fear, a very jocular and irreverend one) of the performances. In vain I laughed at and parodied them. He wrote on with undiminished enthusiasm, always, I noticed, beginning with a fully-drawn-out title-page, with his name, as author, in full capitals. In course of time, however, a

change came over him. I was myself a rhymester, and some verses I had written were not only published, but rather extensively quoted. Carolus determined to beat me on my own ground. He threw away his manuscript drama, laughed at the nonsense he had written, or at odd moments mounted a property wig and flourished a property dagger, to burlesque his old literary love.

At the printing-office in which we were employed, a new publication was put in hand. In the first number appeared a little poem, so charmingly written, so musical, and so full of natural feeling, that it was at once quoted by journals of high repute, and went "the round of the press." It was borrowed by American newspapers, and, for aught I know, may be still travelling from "Poet's Corner" to "Poet's Corner." Those verses were the production of Carolus, the clumsy, boisterous, shock-headed boy, whom no one suspected of poetry. He quickly followed up his success. Popular publications were freely opened to his contributions, and scarcely a week passed without the manuscript of a new poem being submitted to my inspection. Then came the crisis of a life. The passion which made Byron a poet, which shook the mental frame of Keats, awoke a volcanic fire in the heart of my poor young friend. It was a love like Petrarch's, a love which he was bound in manly virtue to wrestle with and subdue. He did wrestle strongly, but in the fatal contest broke his passionate heart. At two-and-twenty, he was a dying man; the symptoms of consumption appeared, and he felt that his career was ending. Still he wrote; the struggle he had endured imparted a sad majestic cadence to his verse; and the tender care of those who loved and watched him was commemorated in lines which for pathetic, affectionate earnestness I have seldom seen excelled. A strange, imaginative poem, infused with a sense of the coming change, was the last he wrote. He sent it to the foremost of our magazines, the famous *Blackwood*, and there it appeared a few days only before his death. I sat by the bed-side watching the wasted form, the pallid face of the dying poet. He could scarcely speak, but his dim eye sparkled as, with hesitating words, he told me how he had received a very complimentary letter from the editor of the magazine. His literary ambition was satisfied, and, calmly and bravely, he turned round to die. A few days afterwards all was over, and the restless, fervid genius, which promised so greatly, was at rest.

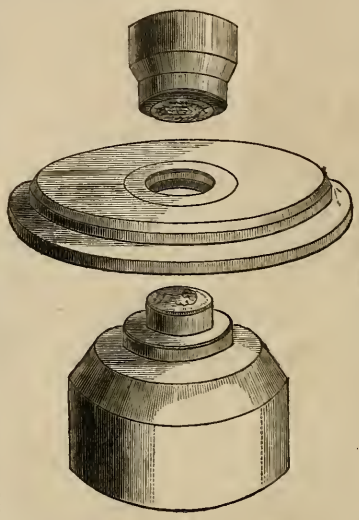
This is no imaginary sketch, but a study from real life—a life, too, passed in poverty, hard work, and great discouragement.

(To be continued.)

Coin from the Crucible to the Press. *

With so much of explanation of the secret machinery of the coining-press room, we may now proceed with more confidence to the action of the press itself. It must be observed that the attendant youth has been supplied with some of our old friends, the sovereign blanks, and that he has taken up a position in a recess formed in the platform, immediately in front of a press. He is, in fact, engaged in piling up a number of blanks, preparatory to placing them in the receiving-tube, immediately above his left hand. The dies, of course, have been carefully set by a skilled mechanic, and all is ready for action. The vertical rod, which extends upward to a quadrant of brass below the fly-arms, is part of the feeding apparatus, and, when in motion, it forces a pair of sliding forceps backward and forward beneath the receiving tube.

Two lines are close to the right hand of the press attendant, and these pass through pipes under the platform to the vacuum-pump. These are the starting and stopping lines. Let it be supposed, now, that the press is completely prepared, and that we are looking on. The first movement of the young coiner will be to pull tightly a cord, and attach it, by means of a loop, to a stud in the "press-hole;" his next to give a sudden jerk to the other cord. The result is, the sharp descent of the press-screw, with its accompanying die, upon the face of a golden disc, which has been laid by the feeder on the lower die. At the instant that this blow was given upon the softened metal, a steel collar, which has its inner edge milled, had risen and enclosed the disc, thus forming a mould for its edge. It will now be understood that as a reverse sovereign die was placed face downwards in the upper die-holder, and that an obverse die rested face upwards in the lower one, and the blank was between the two, a sovereign has been produced by the downward traverse of the press, and such is the fact. The edge, also, has been milled, and the whole operation has not occupied more than a second of time! It is impossible to show by the pencil the exact position in which the dies and blank were when the fly-arms performed a partial revolution and the blow was administered, but the accompanying illustration of a



PAIR OF SOVEREIGN DIES AND MILLED COLLAR,

will give a clearer conception of the operations. It must be remarked that the collar fits easily round the neck of the obverse die, and is readily moved by small levers and springs up or down. After the first piece of money has been struck, the collar is pressed downward, and the flattened forceps are already advancing with a second blank. In approaching the die, the point of the forceps pushes forward the coin into a pan placed on the other side the press to catch it. The forceps open self-actingly, and deposit, with wondrous precision, a second blank on the obverse die. The instant it is so deposited, the reverse die descends upon it, giving it the imprinting squeeze, the collar rising as before, to prevent its too great lateral expansion, to mill it, and to preserve its perfect circularity. It is pushed into the catch-pan as described. Others follow in the same course, the attendant taking care that the feeding-tube is constantly kept supplied with new candidates for sovereign honours. Thus the press is allowed to go on in noisy harmony so long as it yields good work; and its productions are keenly examined at intervals by inspectors, in order to ensure that desideratum, or until the supply of blanks is exhausted. A Mint coining-press will strike 25,000 pieces of money per day, whether they be of gold, silver, or bronze; and as there are eight presses, their aggregate yield is 200,000 coins per day.

It may be well to state that the cords referred to above, and which are so magical in their effects, are attached to the two valves of the vacuum-pumps. When the first is looped up, it allows the outer valve to close by the pressure of a spring. The tug at the second cord opens the inner valve, and this effects a communication between the pump and the vacuum-pipe below it. The consequence is obvious: the atmospheric column exerts its natural force upon the piston, and the latter falls under its weight, carrying with it the rods and the press. In its descent, however, it is accompanied by a "tappet," which closes the inside valve, and then the press rebounds upward, dragging with it in its turn the piston. The inside valve springs open when the piston has reached the extent of its stroke—some fifteen inches—the air impinges once more upon it, and so the alternations go on until the looped cord is released and the outward valve prevented closing. This brings the press to a dead standstill, as no vacuum can then be formed within the pump, and the air presses with equal force on both sides of the piston, keeping it quiescent.

Literally, therefore, the atmosphere coins all our money, and the beautiful impressions on our sovereigns owe their existence to the air we breathe. The gold coins resulting from each day's workings are gathered carefully together, and weighed in quantities of 15 lb. each. Silver coins are weighed in 60 lb. drafts, and bronze in 56 lb. They are all transferred to another room for the closer inspection of each individual coin, and in the case of gold and silver moneys, for the weighing, by automatic machines, of each separate piece. The automatic weighing balances of the Mint are delicate and beautiful pieces of mechanism, invented originally by Mr. Cotton, of the Bank of England, and subsequently much improved upon by Mr. James Napier, the celebrated engineer, of Lambeth.

On their tiny steel pans, each gold coin from the press is made to rest for the space of three seconds, and then it is decided whether it shall pass out into circulation or be returned to the crucible. The extreme limit of variation allowed between sovereign and sovereign is one quarter of a grain on either side the standard weight, which is 256 thousandths of an ounce.

As a rule, 95 per cent. of the gold coin struck at the Mint presses pass through the ordeal of the automatic balances, and are then sent forward to the Bank, in return for the ingots supplied. Eventually, the full 100 per cent. reaches the same establishment, the expense of the re-meltings and re-workings of the metal falling upon the public Treasury. The subjoined Table, giving the weight in decimals of the unit (one ounce) of every coin in the British series, will appropriately complete our brief history of "Coin from the Crucible to the Press:"—

Weight of the Coins of Great Britain.

Denomination of Coin.	Standard Weight.		Legal rem., or variation.		Legal Maximum Weight.		Legal Minimum* Weight.		Diameter of Coins.		Thickness of Blanks.	
	Grs.	Parts.	Grs.	Parts.	Grs.	Parts.	Grs.	Parts.	Ins.	Parts.	Ins.	Parts.
Sovereign . .	123·274	0·256	123·331		123·017		0·875	0·0476				
Half-Sovereign .	61·637	0·128	61·675		61·508		0·755	0·0312

Improved Respiratory Apparatus.

Many valuable lives are lost yearly from suffocation, through workmen rashly or incautiously venturing into places filled with mephitic vapours. Old wells, vaults, cesspools, rooms filled with smoke, and other places filled with gases unsuited for respiration, must, under certain circumstances, be entered by human beings, and various contrivances have been brought forward to facilitate access and assure safety, but they have generally been too complicated, and consequently impracticable in use.

The problem has at length been satisfactorily solved by an ingenious mechanician, Mr. Galibert. The apparatus he has invented has been submitted to severe and conclusive experiments, and deserves being made widely known, as one of the discoveries most useful to mankind.

Mr. Galibert's system is entirely free from mechanism. He employs neither reservoir of compressed air, force pump, nor regulator. It has not even a simple valve. This is a very important feature in apparatus worked only in exceptional cases, and liable to be found out of order, like the parish fire-engine, at the time it is required for use.

The new apparatus assumes two forms. The first consists of a reservoir of air of the capacity

* Concluded from page 171.

* Practically, the "minimum legal weight" applies only to gold coins, and this, when reached, condemns them, as "*light*," to the crucible. Silver and bronze coins are mere tokens of value, and *they* circulate so long as a Mint mark remains upon their surfaces—sometimes even after their devices have totally disappeared.

of about ten gallons, which is sufficient to enable a person to remain from twenty to twenty-five minutes in the most suffocating gas, even in sulphurous acid. This reservoir, which is inflated by a special bellows, receives the open ends of two pipes. The two other extremities of the pipes are fastened

into a piece of horn, which is held in the mouth of the operator by a slight pressure of the teeth. The reservoir being inflated in half a minute, the operator attaches it to his back, by shoulder-straps, like a soldier's knapsack. He then covers his eyes with spectacles, and applies a small instrument (a nip nose) to his nostrils: these are the accessories to the apparatus. The operator breathes through the two pipes simultaneously, and returns into the reservoir the air expelled through the same pipes, taking care to breathe as slowly as possible. The entire weight of the apparatus, including the accessories, does not exceed 3½ lbs. By adding the weight of the bellows employed in inflating the apparatus, and the tin box in which the whole is packed, the gross weight amounts to eight pounds.

With this apparatus the workman is quite free in his movements, and can go readily wherever

his presence may be necessary. Before he has exhausted his store of air, he may have already rescued more than one victim, or saved much valuable property from destruction. Besides, the operator has no need of practice to accustom himself to the use of this apparatus, and to penetrate to great distances, for he can readily change his reservoir when it is exhausted, without retracing his steps.

The second form of apparatus will be particularly useful when the workman has to enter places filled with deleterious gases to the depth of several yards, into wells, cesspools, &c., and remain there for a time more or less long. It consists of two india-rubber tubes, capable of resisting a very strong pressure, attached to the waist of the operator, so as to leave his movements quite free and unimpeded. One of the extremities of these tubes ends in a mouthpiece of horn, similar to that employed in the reservoir of air apparatus. The other end must communicate with the open air. Mr. Galibert has proved that with this apparatus the time during which a person can operate is unlimited, but that it presents the inconvenience of necessitating the quitting the place at intervals and returning, which, in the case of a fire, might be very dangerous. In the apparatus of the reservoir of air this inconvenience is avoided, and this constitutes its superiority over every other apparatus fed by pumps previously employed.

The manner of employing this second form of apparatus differs from that in connection with the air-reservoir in this feature, that, instead of breathing through the two tubes, only one is employed—for one tube must serve for the introduction of the air inspired, and the other for passage of the air expelled. The operator will manœuvre this by covering the hole on the right with his tongue, and in keeping it there while he takes in air, and covering the left hole at the moment he begins to expel air, and so on. This operation, difficult in appearance, is performed without trouble, and, in any case, an error would not be attended by any serious consequences.

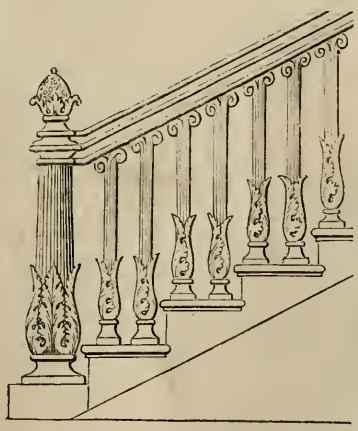
The convenient and efficacious respiratory apparatuses have the advantage of being very inexpensive, costing but a few shillings, so that no workman engaged in occupations where they would prove useful should neglect to provide himself with one. It will afford him much valuable aid in his labours, and probably at some time or other enable him to save life, without the risk of himself becoming a victim.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

BALUSTRADES.

The heavy, ill-shaped balustrades which formerly disfigured the staircases of our mansions and higher class of residences are rapidly disappearing before designs of a more ornamental and appropriate character. The change has been



accelerated in no small degree by the extensive substitution of stone for wood in the construction of staircases. Where the stairs are made of stone, it becomes almost a necessity that the balustrades should be formed of iron or bronze; thus giving the designer or the architect ample scope for increasing the ornamental appearance of the staircase without materially increasing the cost. Where wrought iron is used, the forms are generally of a simple character; but where cast iron is employed, there is practically no limit to the exercise of the designer's ingenuity. The two examples furnished by us this week will show the kind of ornamentation principally in use at

the present day; but in designing balustrades, care should be taken that very few points or projections be introduced, especially at the base of the balustrades, as these projections are apt to catch the dress in passing, and otherwise become sources of personal annoyance.

THE NORTHUMBERLAND HINDS AND THEIR BONDAGERS.

A noteworthy agitation has begun amongst the agricultural labourers of Northumberland. One of the remaining relics of feudalism there is connected with the engagement of hinds by the farmers. The hind hires himself for the year, receiving for his services thirteen bolls of corn at the market price, £5 in money, known by the name of "stent money;" 1,000 yards of potatoes, planted for him; a house to live in, of seldom more than one room; the keep of a cow, and his coals free. These are generally agreed upon, but variations take place, according to bargain. The hind is bound to supply a sufficient worker, or bondager, for the service of the farmer. The bondager is sometimes a young lad, but more frequently a girl or woman, and may be any age between sixteen and forty-five. The farmers prefer women, as they can get as much work out of them as a man; and they may often be seen doing men's work, such as harrowing, driving carts, binding at harvest-time, and other laborious work which elsewhere is always done by men. The hind pays the bondager £12 a year, and provides him or her, as the case may be, with lodgings and victuals. The £12 a year is paid at the rate of £8 in summer, and £4 in the winter. The farmer only pays the hind for the services of the bondager when employed. In summer the hind receives from 10d. to 1s. a day for her services; in winter from 8d. to 10d.; while in harvest-time the pay is 1s. 6d. Apart from the immorality incident to this objectionable system, the hind finds in practice that the bondager costs him more than he receives from his master for her services. This is the ground of objection with the hind, and he very reasonably insists that the farmer should himself pay for the services he requires, as is the case in other parts of the kingdom where a different

system prevails. The employer, however, strenuously advocates the retention of this relic of a barbarous age.

The annual hiring-day was held recently at Alnwick, and a meeting took place to protest against a continuance of the system. The *Newcastle Chronicle* contains a report of the proceedings, from which it would seem that there was little or no organisation. Great numbers of the men assembled in Bailiffgate, and after waiting there some time, a man—one of the hinds themselves—addressed the meeting. His speech, utterly unlike that of a professional agitator, was characterised by homeliness, mother-wit, and utter absence of antipathy to the master farmers. He urged his hearers to stand out against the "bondager" system, and gave incidentally some notion of the sort of life these Northumberland men live. They had to be up at half-past four in the morning, and after working until six at night, could then "come in," and were kept rubbing the "poor skins" of the horses until nine o'clock; then home to bed, and up again at half-past four. He would have them stand together, and then they might ring the knell of the bondager system that day in Alnwick. He was followed by another hind, and it was ultimately agreed that a collection of one penny apiece should be taken to defray the expense of keeping the bellman going about the town to let the hinds and others concerned know that the bondage system should cease. Hiring was almost in a state of stagnation.

Scenes in the House of Commons

DURING THE REFORM DEBATES.

It is said that Expectation stands on tiptoe; but, certainly, the poet who used this figure did not acquire it in the House of Commons, where Expectation, either in the Speaker's or Peers' Gallery, is not allowed to stand at all, but is made to sit down. Were it otherwise, the eager lady had on tiptoe stood to hear Mr. Gladstone's speech. An eminent American writer had to send a substitute sitter to the court of the Strangers' Gallery, as early as six o'clock in the morning, to keep a seat for him on his arrival at four in the afternoon. The avenues of St. Stephen's presented concourses of spectators, who hoped to catch sight of the Chancellor of the People as he passed into the House. Reporters were hurrying to their gallery, the messengers were being marshalled, the telegraphic wires were waiting to transmit the words of the orator as soon as his accents were heard.

No sooner had the procession of the mace arrived, Mr. Dodson appeared, and the list of the Speaker's orders been handed to Mr. Circuit, than the throng of gentlemen whose names were down made a rush to the Speaker's Gallery-door, and impatiently waited until prayers were over. Mr. Russell, of the *Scotsman*, and Mr. W. Rathbone Grey were among the first to enter, where every seat was coveted. In addition to the usual Speaker's List, there is, on great days of interest, also a Speaker's Private List, and a sharp struggle for precedence occurs, lest the gallery should be filled by the private list before the usual one is exhausted.

The interior of the House presented Mr. Dodson, Chairman of Committees, in the Speaker's place, acting as Deputy-Speaker. The accident to Mr. Denison having become more serious, he was unable to preside. On the Wednesday previously he had to be drawn along the lobbies in a sedan chair, and absolute rest has been since enjoined him.

The Members', Peers', Speaker's, and Strangers' Galleries were crowded. Wherever peer could stand, or a stranger sit, on seats or between them, the space was occupied. Members in the House were buzzing about, preparatory to the coming speech. The Duke of Argyll, Lord Cardigan, and ambassadors, prelates, Catholic and Protestant, were among the auditors. The Princess of Wales arrived to hear Mr. Gladstone. Mr. Disraeli was saturnine as usual. The right hon. member for Bucks, Mr. Disraeli, has learned to sit still—a difficult art in that exciting arena. When Mr. Gladstone appealed to him directly, he did not open his eyes; when personal reference was made to him, he did not relax the Sphynx-like insensibility which he chooses to maintain on great occasions.

It is sometimes said that eloquence is losing its reputation; that men are satisfied with what they can read. It would appear that reading much only stimulates the taste for noble speech. The note of the singer, the movement of the dancer, the touch of the artist, can be read about; but to hear them or see them is inspiration. The difference between the spoken and reported speech is that which subsists between the painted and natural rose; both are beautiful, but only one has fragrance. The thronged auditors, who had used high influence to be present at Mr. Gladstone's, Mr. Horsman's, Mr. Lowe's, and Mr. Bright's orations which followed, attest the undying interest which still attaches to oratory.

Mr. Gladstone was received with cheers as he took his seat on the ministerial bench, and when he rose to move the first reading of the Government Reform Bill. He began in grave and measured terms, suited, from their cadence and solemnity, more for the church than the senate. The sense of deference and responsibility was almost oppressive. No fiery phrase or pregnant word enlivened the exordium. In language nervous and earnest, as is the wont of Mr. Gladstone to use, he gave a history and exposition of his subject.

Manifest relief was expressed by the House and galleries too, at hearing that the perplexing, evasive, Rate-paying devices were to be thrown over. There was satisfaction when the Lodger franchise was introduced. A murmur of wonder greeted the announcement of the strange £14 franchise for counties; and a protracted exclamation and universal buzzing when the unfathomable orator announced a £7 franchise for boroughs. The art and clearness of the exposition of the features of the Bill were such as only Mr. Gladstone could exhibit. As a whole, the speech wanted fervour and force. The last Reform Bill which Lord Russell introduced, was described in a faint, half-inaudible, sepulchral speech. His lordship did not come like Mark Anthony to bury Cæsar—but he did it. Mr. Gladstone's silvery voice and ceaseless flow of harmonious periods are always graceful, if sometimes conventional. His speech was equal to the best we have had on any similar occasion since the great days of 1831-2. But it must be owned that it was not equal to so great an occasion, in the hands of so great a master of oratory.

The manhood and intelligence of the nation had so increased in force and sense that they came up for admission to the suffrage. The outside nation stood at the Parliamentary door. It was a proud thing for the country that it had new people anxious to discharge civil duties. It should be a matter of inspiration to plead for them. Mr. Gladstone did not speak as though he felt it. He did not regard the people, it is true, as a Trojan horse, laden with armed men, bent on plunder and slaughter. He gave them the more honourable welcome of "recruits." There were fervour and dignity in the peroration, but in this part only was he eloquent after his own manner. When, indeed, he arrived at the statistics of the Bill, the orator abandoned his grave cadences. Like a sea-bird he plunged into the ocean of figures with an impulse of joy. Here every sentence was natural, rapid, and animated. Again, when he came to Latin quotations and Greek images, he recovered not only his natural manner, but his fine sonorous emphasis. This was particularly marked as he spoke of the "armed men" who issued from the Trojan horse. As the right hon. gentleman pronounced the words he filled the House with a volume of musical and martial sound, which charmed all hearers, and heralded, like a trumpet, the march of his approaching peroration. A few fit and noble sentences followed, in Mr. Gladstone's best manner, closing an exposition rather than an oration such as he is accustomed to give, when loud cheers broke forth.

The Bill brought forward by Mr. Gladstone it is no part of our business to describe politically. This article is restricted to a description of the incidents attending its introduction. It is a Bill which does not meet popular expectation, nor much disappoint it. It will not much offend the Opposition, nor excite enthusiasm, but it will advance the liberties and representation of working men. The most powerful arguments for the Bill were drawn from the conduct of working men in the great cotton crisis. Mention was made of the distinguished, industrial, and administrative efforts of the Rochdale Co-operators. After Mr. Gladstone's speech, the House thinned for dinner, as is usual with it from seven to nine o'clock.

It is a physiological fact, that the Conservative side of the House are always longer dining than the Liberal. Whether it is that the Conservatives have a better appetite, or the Liberals are more temperate, there is no "return" to show; but certainly the seats on the Liberal side are always filled after dinner earlier than the other.

Then followed, during the thin period, a series of small speeches from the minor members on both sides the House. Before long, the authority of Mr. Deputy-Speaker was invoked. Mr. Baines, the member for Leeds, rose to speak; but at the same time Captain Grosvenor, the young member for Westminster, rose, and, as he had not yet spoken in the House, there was a general cry of "Grosvenor, Grosvenor!" Others, however, thought the honourable member for Leeds, who had himself brought in a "single-barrelled Reform Bill," ought to be heard, in preference to the gallant young captain, who, though joint member for Westminster with Mr. John Stuart Mill, had as yet brought in nothing; and great cries were made of "Baines, Baines!" Thereupon the Grosvenorites and the Bainsites amalgamated their cries, and "Baines—Grosvenor!" and "Grosvenor—Baines!" resounded everywhere. Mr. Baines dropped down when the cry of "Baines!" drooped, and Captain Grosvenor popped up as the cry of "Grosvenor!" rose. Grosvenor up, Baines down, went on for a time: at last both honourable members stood up together. The confusion was increased by cries of "Chair, chair!" The Deputy-Speaker not seeing how to calm the tumult, and his cry of "Order, order!" being unattended to, Mr. Disraeli, who had been silencing his friends around him, rose, and, as he always commands a hearing, he said, "It being contrary to the usages of this House that two members should be upon their legs at the same time, it is your privilege, Mr. Deputy-Speaker, to indicate who shall address the House." Upon this Mr. Dodson indicated Mr. Baines. Peace was restored, and the speech of Mr. Baines proceeded. Captain Grosvenor made a maiden speech of some confidence and quality. After much miscellaneous talking, neither very bad nor very good, Mr. Horsman appeared on the scene. The House had then re-filled. He had been expected for an hour or more before he commenced; but he was said to be engaged in the Tea-room, "pointing his sentences." The honourable member for Stroud, though always vivacious, ready, epigrammatical, and antithetical, has the reputation of arranging his ideas by the lamp, and of working up those carefully-turned phrases, which are afterwards given off with a happy spontaneous air. His speech was a model of personality within parliamentary limits. The intention was to provoke Mr. Bright to a reply. Mr. Horsman, however, was unsuccessful in accomplishing this. The honourable member for Birmingham maintained a contemptuous, premeditated, and disappointing silence. Mr. Horsman's speech had that increasing coarseness in its merriment peculiar to him of late, and which hardly warrants a cultivated man in laughing at him. As Mr. Bright did not reply, the debate was manifestly incomplete, and was accordingly adjourned to the next night.

As soon as the private business was over on Tuesday, the Hon. Mr. Lowe rose to speak. It was foreknown that he would do so, and the House was crowded in every part; and the Peers' Gallery and every place of honour in the House (His Royal Highness the Prince of Wales being among the visitors) was filled. Mr. Lowe, remarkable for his Albino complexion and Attic culture, is distinguished in the eyes of strangers, and is a favourite in the House. The ministerial benches were crowded, the Hon. Mr. Goschen conspicuous like a golden star among them. The honourable member wears a pair of glasses, united by a broad gold band, which glitters between his eyes as the light from above impinges them. The Opposition members were no less numerous, though less luminous.

Uprising like a marble pillar, the Right Hon. Mr. Lowe, with white-haired head, and in perfectly perpendicular attitude, proceeded, in quick, energetic, ceaseless sentences, to deliver his expected philippic against Ministers, the measure, and its supporters, especially Mr. Bright. For an hour and a half he kept the House in a scream of merriment, in which the galleries, not authorised to laugh, joined, as did the peers, the clerks at the table, and oftentimes the impartial Chair. At the conclusion of Mr. Lowe's speech, Mr. Villiers rose to reply, and delivered a cogent, very apt, and even eloquent Poor Law Board answer to the honourable member for Calne. This was the commencement of the dinner-time speeches. Among the most

notable of these interregnum orations was a first speech by Mr. A. W. Peel, the youngest son of the late Sir Robert Peel. The honourable gentleman began with prepared and stilted sentences, of the "my name is Norval" species; but he soon passed into natural, sensible narrative. His sentiments have all the rational liberality of his house; he has a voice of considerable power; and is, no doubt, destined to be heard in future with distinction. Mr. Whiteside, who, as Mr. Bright said, would not fail to be amusing, though the country were in ruins, delivered one of his happiest speeches—satiric, without ill-humour. Mr. Whiteside is never so brilliant as when he is good-tempered. Mr. Goschen rose to reply—to Mr. Lowe, it was hoped—when the Deputy-Speaker indicated the new member for Brighton, Mr. Fawcett, as having first caught his eye. The new member, who has a commanding voice, great courage of speech, and an unfaltering flow of balanced sentences, delivered the ablest first speech, as a piece of oratory, the House has heard for a long time. Had the honourable professor not spoken five minutes too long, his speech had been a triumph of effectiveness. When he has caught the elasticity of speech which the House requires, Mr. Fawcett will be an addition to its eloquence and debating power.

At last Mr. Bright arose, and a sound of bustle ran through the House as he did so. An attack on Mr. Bright, vigorous and telling, is always welcomed by honourable members on both sides, not from want of respect for Mr. Bright, but from love of sport. It is well known no man can take better care of himself in that House than Mr. Bright. He is a match for the ablest brain and the most satiric tongue; and he is sure to return, if he condescends to make the attempt, any critical attentions paid to him, with compound interest. His speech gave the House manifest delight; convulsions of laughter ran through it, as hit after hit told upon his opponents. With a voice of greater modulation and power than that of any other living orator, its lowest tones are heard in every part of the House, and its highest ring through the lobbies; but its melody never abates. To this charm of delivery is added a style of unsurpassed simplicity and vigour. Never obscure and never feeble, the structure of his sentences charm as much as their humour. To give examples would be to quote half his speech. When he described Mr. Horsman as dwelling in a "political cave of Adullam, standing at the entrance, and calling to him every one that was in distress, and every one that was discontented," both sides of the House broke into convulsions of laughter; and when he added that the amiable party of two (Mr. Lowe and Mr. Horsman) were so like the Scotch terrier—"so covered with hair that you could not tell which was the head and which was the tail,"—the ministerial benches were as much convulsed as the rest of the House. Mr. Gladstone laughed as heartily as others, and Mr. Disraeli, who never laughs, made the best imitation of it he has been betrayed into for some time. Mr. Horsman, who is as sensitive as he is acrimonious, did not at all like it. Mr. Lowe, who can relish wit as well as employ it, was as merry as any; but the hit at him, which described Mr. Lowe as taking a "Botany Bay" view of the working classes, made a deeper impression, and will live longer in the memory of the public than even the salient illustration of the "Scotch terrier."

This speech closed a great debate. Lord Cranborne and Mr. John Hardy, imitating his namesake, Mr. Gathorne, added a little galvanic acidity; and the first reading of the Bill was accomplished. No question but that the discussion has greatly raised the character of the debating power of the Government; and the burden of the speeches delivered manifested a more respectful appreciation of the claims and character of the working classes of England than the House of Commons has ever before shown.

A New Coalfield.—Some months ago the results of borings in the vicinity of Sessay, in the North Riding, led to the hope that ultimately a deposit of coal worth working would be found on the south side of the Hambledon Range. The search for the mineral has been continued, and it is now reported that, upon Lady Downe's estate at Birdforth, three miles west of Coxwold, the engineer has met with a thin seam of very good coal, with indications of a thicker and much more valuable seam below. A shaft is to be sunk. Other owners are about searching for coal all along the moor base.

How the Rate of Wages may be Raised.

BY ARTHUR HOUSTON, M.A.,

Whately Professor of Political Economy in the University of Dublin.

In our last article on the Rate of Wages (see page 121), we explained what were the circumstances by which, in a state of unrestricted competition, the value of labour would be determined. A state of perfectly free competition, however, is a thing which society has, perhaps, never yet seen, and probably is never destined to see. It was, notwithstanding, no less necessary to ascertain with precision what the circumstances referred to were, inasmuch as we have already seen that the success of any attempt to control the spontaneous action of the natural laws of political economy will, in a great measure, depend upon the extent to which their opposition has been calculated upon and provided for. Nor, indeed, is this less true of those laws of political economy which belong to the class we have styled *artificial*. Positive law and established usage relating to value may prove as troublesome impediments in the way of effecting any alteration in it, as demand and supply. For our present purpose, however, which is to ascertain how the value of labour may be raised, this latter consideration is of the less importance, as whatever influences are now at work tending to make the value of labour deviate from what in a state of pure competition it would be, are mostly such as tend to keep it above rather than below that level.* There are now, fortunately, no laws against employers paying workmen more than a certain wage, or against workmen combining to procure, by peaceable means, better terms from their employers. In making any effort, therefore, to raise the value of labour, we shall have to take account only of the resistance presented by the natural law of demand and supply, there being, as we have intimated, no artificial obstacles created by society to obstruct our exertions.

Assuming, now, that in a country such as the United Kingdom, where there were no artificial influences tending to keep down the value of labour, it was nevertheless so low that the working classes and those interested in their welfare were resolved to try to raise it to a more satisfactory level, let us inquire what means should be employed to accomplish that object.

There are obviously two ways of setting about raising the value of any article. First, there is what may be called the indirect method—namely, by acting on value through demand, or supply, or both; increasing one or diminishing the other, or so altering the proportion between them that, as compared with the supply, the demand shall be greater than it was previously. Secondly, there is what may be called the direct method—that is to say, fixing at once upon a value below which the article is not to be bought or sold, and enforcing that regulation by law, public opinion, combination, or some other means.

That such a mode of proceeding as the latter may be effectual is put beyond all doubt by the fact, that the value of one of the most important of all articles of wealth—namely, land—is, over a large portion of the globe, fixed entirely by law or custom. In those parts of Continental Europe, for example, in which peasant-proprietorship does not prevail, the rent of land—which, of course, is only another word for the value of one year's possession and use of it—instead of being settled by the competition of rival bidders, as in the United Kingdom, is most frequently determined by a custom that landlord and tenant shall divide the produce, in a fixed proportion, between them. In India, again, the cultivators hold their lands at a certain rent, which cannot be *raised*, although in practice it is often found necessary to accept *less* than this maximum. But land is not the only thing that is removed from the domain of unrestricted competition—is not the only article whose value is regulated by other influences than those of mere demand and supply. The remuneration of professional men—in other words, the value of their services—has long been determined by custom, sanctioned by the learned bodies which preside over each profession, or, as in the case of attorneys and solicitors, modified by positive law.

With such examples as these before us, it would be idle to deny that it is possible to act on value in the direct mode above indicated. But, nevertheless, such a method of going to work is beset with great difficulties, for a reason already glanced at—namely, that it leaves out of sight the resistance which the spontaneous action of the law of demand and supply will offer to the accomplishment of the object in view, and the possibility that such object, though secured for a time, may in the end be entirely defeated. It will only be necessary to refer to the example given towards the close of our last article for an illustration and a proof of this fact. It is true that where direct attempts to regulate the value of labour in this way have been made under favourable circumstances, and where they have been persevered in for a sufficient time, they have often succeeded, the demand and supply adjusting themselves to the value, instead of the value adjusting itself to them. It will, however, be found on examination that, in many cases where it would appear at first sight that this direct method of acting on value was employed with success, the result was due principally to the assistance it derived from the effect produced indirectly on value by some control exercised over the supply. And this is especially true of attempts to raise the value of *labour*. These have, as every one knows, been made chiefly by combinations of workmen engaged in particular trades. Their course of proceeding has usually been to begin by fixing upon some rate of wages below which they would not consent to work. So far they were endeavouring to raise the value of their labour by what we have styled the direct method. But experience soon taught them that this was not enough; that to succeed in permanently securing the rate of remuneration so fixed, it was necessary to limit the number of persons seeking employment in their particular trade. If this were not done, the capital invested in that branch of business being only sufficient to give employment to a certain number at that rate, and there being therefore an overplus of unemployed men, only too glad to accept of almost any terms, the competition of these persons constantly endangered the position of those employed at the rate of wages fixed by the combination. Many such efforts accordingly failed through this obstacle to their success. The law of demand and supply proved too strong for the combination. The workmen usually had the sagacity to perceive the cause of the failure, and to take the proper means of providing against its recurrence. Seeing that so long as a surplus of unemployed members of the trade existed the possibility of maintaining the advanced rate of wages was hopeless, they devised means for preventing the continuance of such a surplus. This is the origin of the rules regulating the number of apprentices, prohibiting overtime, and in some cases limiting the amount of effort which the workman was allowed to put forth. The justice and expediency of all such regulations we intend to consider hereafter. At present it is only material to observe, that the conduct of the combined operatives in this matter was in strict accordance with what political economy would point out as a method of accomplishing their purpose, be it a proper or improper one. By such restrictions they diminished the supply of labour in all three of the elements of which we saw in our last article that the supply of labour was composed; and by this diminution of the supply it was kept down to the quantity which, at the rate of wages fixed, could be paid for by the amount of capital embarked in the business. In other words, having determined the value of labour beforehand, they adjusted the supply of labour to the demand accordingly, and thus evaded the difficulty created by the spontaneous action of the law of demand and supply.

* An important exception to this rule occurs in the case of women's work. Their wages are almost universally lower than those of men engaged in the same employment or employments which, from their hardship or other circumstances, ought to be paid at the same rate. This difference of remuneration is partly attributable to the inferiority that sometimes, but not always, belongs to the quantity and quality of the work done by women. Any inequality beyond this can only be accounted for by custom.

Facts prove that in this country it is cold and not heat which exerts the most deadly influence on the mortality; and what is still more striking is the fact that all our so-called epidemic diseases, excepting alone the bowel complaints, increase with the cold and diminish with the warm weather.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

In reply to several correspondents who are anxious to compete for the prizes, but are uncertain whether they may fairly be considered working men, we beg to say that we do not wish to define the term too narrowly. All who work at any handicraft; foremen, small employers, being themselves workers; assistants in retail shops, domestic servants, porters, and other unskilled labourers—all are entitled to compete. In doubtful cases, not easily defined, it will be left to the adjudicators to decide. If any man objects to being called a working man, and asserts that his occupation raises him out of the ranks, he may fairly consider that he is disqualified as a competitor for the prizes.

"All labour is sacred."—*Carlyle.*

THE MORTICING MACHINE.

Parliamentary Definition of the Working Man.

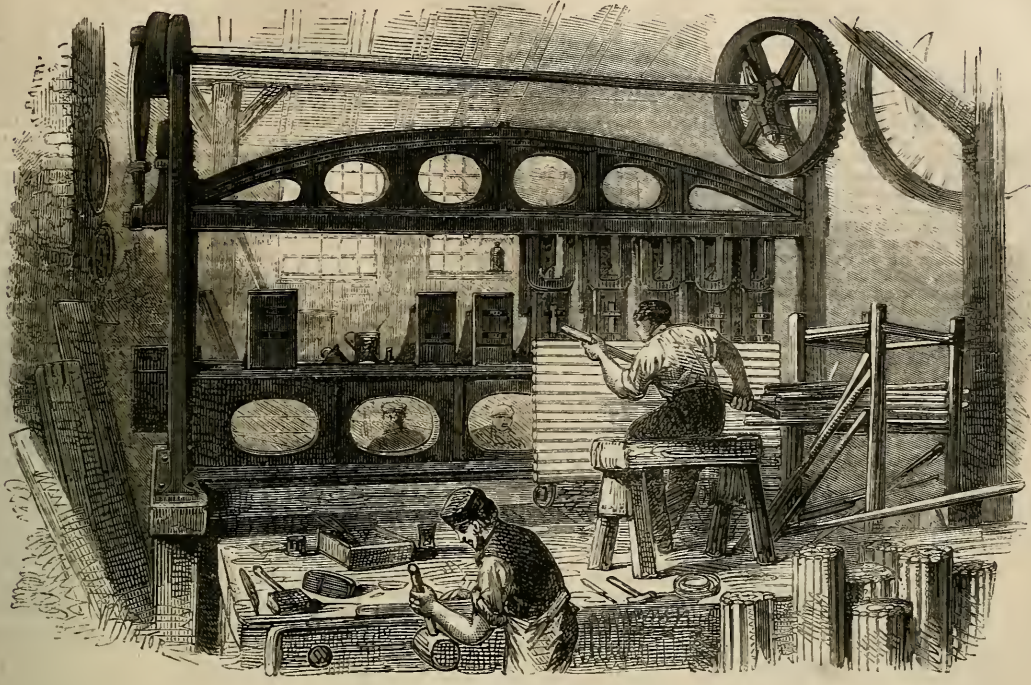
"Dryasdust" was a statistician; and if the race are numerous, they have had a treat this week. The Government have published a heavy volume, of 200 pages of figures, upon the state of the franchise. It appears from this source that the number of the working class now upon the register of voters make a total of 128,000. In every 100 electors throughout the country there are now, according to this new authority, twenty-six who belong to the working class. It is doubtful whether there are so many as 100,000 electors of the class understood by Parliament to be working men. A Parliamentary definition of a working man is, that "he should be a journeyman employed by a master at daily or weekly wages; but including men who work daily at their own handicraft without a master, and even some employing a journeyman or an apprentice, provided they derive their chief support from their own hand labour, and not from the labour of others, or the profits arising from the employment of capital or the supply of materials." No artisan, mechanic, or labourer was to be excluded because he had a shop which was kept by his wife or other member of his family; but, as a general rule, shopkeepers and their shop assistants were not to be inserted. Overlookers, superintendents, foremen, and others employed among or in connection with operatives, workmen, or other daily labourers, were not to be included, unless actually employed in daily manual labour in the same manner in every respect as the men who were under them. The returns under this head show that the total number of electors who come within the description of mechanics, artisans, and other persons supporting themselves by daily manual labour in England and Wales, is 128,000, allowing for deductions needless to specify here.

So far as we remember, the attempt made in these Franchise Statistics to define the working man is the first which has been made for Parliamentary purposes. It is not to be assumed that the parochial authorities in the numerous parishes in England and Wales have applied this rather complex definition with very great accuracy. In some instances ignorance, in others, prejudice, and in important instances, political bias, has, no doubt, affected these returns. Take, for instance, such a well-known working class town as Ashton-under-Lyne, represented by Mr. Milner Gibson, President of the Board of Trade. In this town the working class are known and easily definable, if definable anywhere at all; and since the President of the Poor Law Board, who collected the statistics, is member for the town, here, if anywhere, returns which could not be disputed might be expected. Yet, as it happens that the parochial authorities of the town are of the Conservative school, and being unfriendly to a Reform Bill, or deeming it unnecessary, they are said to have returned the largest number they could under the designation of the working class, with a view to show that a sufficient number of that class are already on the register. They have, therefore, so it is alleged, made a very liberal interpretation of the Parliamentary definition. It is possible that in other constituencies Radical overseers may have adopted a narrow interpretation of the same definition. However, Ashton-under-Lyne is a singular, if not typical instance, and Mr. Hugh Mason, an intelligent magistrate of the town, has had the registers carefully examined, and has publicly reported the number put down in the Government returns is one-half greater than the actual working class electors! Mr. Hibbert, M.P. for Oldham, has borne similar testimony. Allowing, however, for political bias on both sides, the working men who are at present electors cannot be taken at more than 100,000. Mr. Bright, an authority on the subject, says they are much less, and that the Government statistics are delusive.

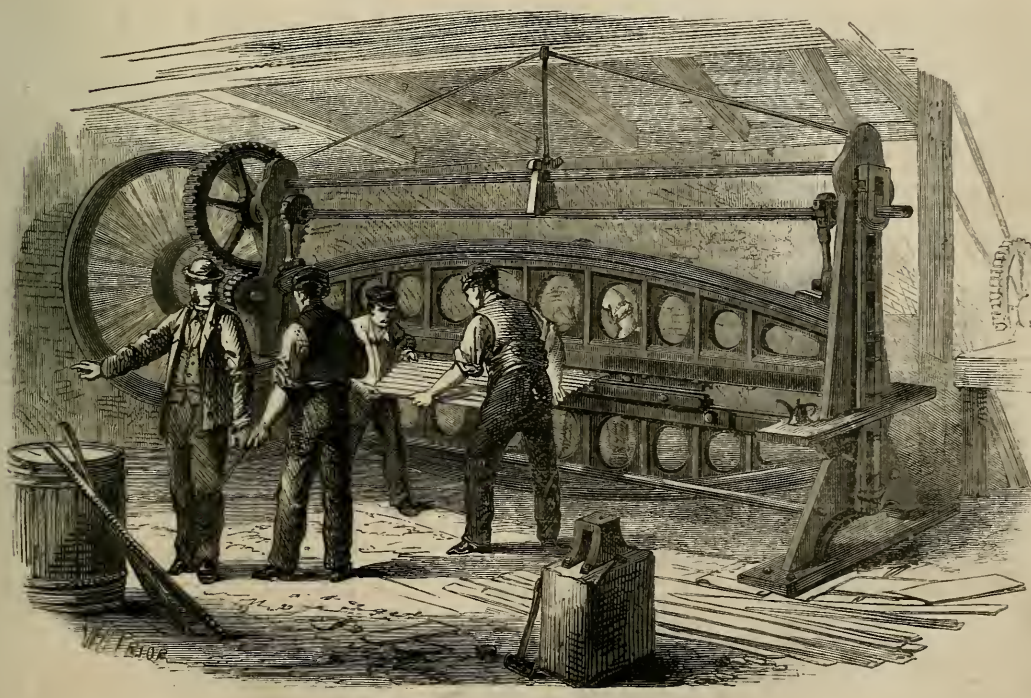
In a curious passage of Mr. Gladstone's speech, on introducing the new Reform Bill, the right hon. gentleman showed that he had made the working man the subject of financial study; and he explained how he determined a man's income from the value of the house he occupied. He said—"£10 clear annual value, when you make the proper addition for rates and furniture, must mean that the house costs the man not less than £16. I think I am safe, and speak with moderation, when I say that the working man does not spend more than one-sixth of his income on his house. As well as we can gather, it is one-sixth; therefore, his income must be £96, or, in other words, without making any allowance whatever for sickness and interruption of work, he must receive £1 17s. a week; or, if we allow for necessary breaks, £2 a week wages: but it is a small proportion of the working class that get £2 a week wages; and I do not think, therefore, that the franchise can be said to be literally and largely within the reaching of the working man at £10 annual rental. The £7 franchise will certainly work in a different manner. The net £7, allowing 60 per cent. for rates and furniture, would give a gross sum of £11 4s. That would represent £67 4s. But instead of thirty odd shillings a week, the wages of a man occupying such a house would be a little under 26s. a week. That sum is, undoubtedly, unattainable by the peasantry, and by mere hand labour, except in very rare circumstances; but it is generally attainable by artisans and skilled labourers." And so we learn the Chancellor of the Exchequer's method of discovering a working man's wages.

The character which the working class received in the debate, which we have elsewhere noticed, was more discriminating and respectful than has ever before fallen to them. The Co-operators of Rochdale, to whom in these pages reference is often made, Mr. Gladstone distinguished by a remarkable tribute, which we have quoted in another page. Only a very small party in Parliament take what Mr. Bright aptly satirised as the Botany Bay view of the working man, and we think we may congratulate him on juster appreciation and fairer treatment than heretofore.

THE WORKSHOPS OF THE WORLD.



MACHINE FOR MAKING SELF-COILING WOODEN SHUTTERS.



THE RECIPROCATING CORRUGATING MACHINE.

Manufacture of Revolving Shutters.

Revolving shutters, the subject of our present article, have been in use for the last twenty-five or thirty years, but when first introduced were of very crude and now nearly obsolete construction, being far too complicated and expensive for general use, and although a desideratum much required by modern civilisation, only obtained a limited amount of patronage, owing to their great expense, complication, and difficulty of application, and would never have been capable of universal adoption had it not been for the ingenuity and great perseverance of Messrs. Clark and Co., of Rathbone Place, London, who have, during the last ten years, obtained no less than ten patents for various improvements in revolving shutters, and have recently erected very extensive premises in Rathbone Place, Oxford Street, covering an area of upwards of an acre of ground, and five floors in height, fitted with powerful steam-engines, and extensive plant of novel machinery

(a portion of which we have illustrated). Their works give employment to several hundred hands, and are capable of producing several thousand feet of shuttering daily; and being the sole patentees and manufacturers of self-coiling shutters, they have to supply the whole world.

The most important of the improvements introduced by them are their patent self-coiling principle in one sheet of steel, and of wood laths connected with bands of steel. Revolving shutters have hitherto been constructed of laths of ordinary hoop-iron, connected by hinges rivoted thereto, and are consequently composed of innumerable pieces, and are also very heavy. These hinges, rivets, and pins are constantly getting out of order, and, moreover, do not possess one single element of security, as an ordinary burglar, with the aid of a jemmy, can with the greatest ease, and without noise, force off the hinges and detach one lath from the other. These shutters are also, from their construction, necessarily very heavy, and require complicated machinery to open and close them, which adds greatly to their expense and inefficiency. The steel revolving shutters of Messrs. Clark and Co. are, on the contrary, of the most simple construction imaginable, being of one sheet of steel without hinges, pins, or rivets. They are impregnable; no "jemmy" or burglarious instrument can be brought to bear upon them, and being of tempered steel, they cannot be cut or drilled. It is well known that steel is of twice the strength and ten times the durability of iron. A steel shutter, therefore, of this construction is at least double the strength, although only half the weight, of the iron shutter; and its lightness, coupled with its inherent self-coiling tendency, renders the use of the complicated gearing or machinery wholly unnecessary; it does not even require a roller to coil upon.

The machinery for the manufacture of the steel revolving shutter is extremely ingenious, although simple. The steel is reduced to sheets by the ordinary process of rolling to the required thickness; these sheets are then corrugated by a machine expressly adapted for the purpose, as represented in our illustration. This operation is sometimes performed by fluted rollers, but only produces one size of corrugation. These rollers are not so much used as the reciprocating corrugating machine. The corrugated sheets are then subjected to a process of flattening, sometimes by rollers and sometimes by hand. A strong T iron bottom bar is riveted on the lower edge of the shutter, and the upper edge is affixed to a machine which is designated *a curling machine*, which produces a roll or curl on the upper edge as a finish, of great stiffness. The shutters are then, by means of tempering and rolling, given a permanent tendency to coil, thereby rendering them self-coiling, so that, if laid out on the floor, they will roll or coil themselves up into a cylindrical form.

When placed in position, iron or wood grooves are used for them to slide in, and a circular space at the head of the window is left for them to coil into. No machinery, rollers, or balance weights of any description are required, and there is no working part but the shutter itself, which is in one piece or sheet; the shutter is merely raised or lowered by hand. It is obvious that a revolving shutter of this description is almost impossible to get out of order, and is as simple as it is secure.

The purposes to which a shutter or closer of this simple construction can be applied are innumerable. Messrs. Clark and Co. have many thousands of them in use for closing private house windows, shop fronts, banks, insurance offices, bankers' and solicitors' fittings, closing doors, coach-house gates, railway sheds, cabin doors, hatchways on board ship, book-cases, dividing rooms, fire-places, &c.—in fact, wherever an opening has to be closed, these shutters are the most secure, simple, and efficient.

One of these steel revolving shutters has been recently erected at the Theatre Royal, Edinburgh, for dividing the auditorium from the stage. It is the largest revolving shutter ever manufactured, and, we believe, works admirably. The doors and windows of all our principal public buildings, music halls, and theatres are closed with this shutter. They are now also being extensively used on the Continent; Messrs. Clark and Co. having now in hand orders for fitting several Continental towns (including the new capital of Italy) with them.

The price of the steel revolving shutters is about half that of the ordinary revolving iron shutters: nay, more than this, by means of the principle of *self-coiling in wood*, the humblest cottage can be fitted with a revolving shutter as cheap as the clumsy and inefficient folding shutter hitherto used, which will prove a great boon to the working classes.

The wood self-coiling shutters are manufactured by machinery specially adapted for the purpose. The laths are of several forms; the cylindrical laths are prepared by means of rotary cutters, such as are used in the manufacture of umbrella-sticks, pencils, and other like round articles, as well understood, the cutters being mounted radially on a rotating socket, with the cutting edges towards the centre, through which the lath of wood is passed. The cutter socket, or chuck, rotates at a high velocity, and the wood is fed up to it by feed-rollers or other self-acting means. The rods, or laths, having been so prepared, are then taken to the machine, in which they are to be punched and threaded on the metal strips, as before mentioned.

This machine is of the length of the rods, and equal to the widest shutter required, and is fitted with a number of punching parts, adjusted at intervals throughout the length at the distances apart required for the steel strips to be inserted. The metal strips are placed in position on the machine, and by a process extremely difficult to describe without the aid of diagrams, the wooden rods are pierced by means of punches, and slipped on to the metal. The ease and rapidity with which this is effected is truly astonishing, a few minutes only elapsing before a complete shutter is formed, by the wooden laths being threaded, as it were, upon the steel thread, or coil. The laths for the bivalved shutters are prepared by a machine having four sets of rotating cutters, through which the wood is fed by rollers. The laths leave these machines in a perfect state. They are then taken to the morticing machine shown in our illustration, where they are pierced with slits for the reception of the metal coil. The rapidity with which this operation is effected is marvellous to those accustomed only to the older methods of morticing, each worker being capable of doing nearly 100 per hour.

*Happy Homes for Working Men, and How to Get Them.**

The question relating to the condition of the homes in which so many of our industrious toilers are lodged, is one of vital interest, both to the working man himself and to those who naturally take an interest in his welfare. Dr. Begg undertakes to show what these homes should be, and how they may be obtained. No mere extension of the barrack system will, in his opinion, meet the evil. "Man must not only have a covering, but a *home*." The idea of home, with all its delightful associations, its concentrated power, and far reaching influences, is as certainly of Divine origin as the existence of man himself. To have this home properly established, the author declares to be "an essential condition of individual happiness, Christian security, and national well-being."

Taking this as his starting-point, Dr. Begg shows that the first step necessary is to bring suitable houses into existence in sufficient numbers; and explains how this may be effectually and profitably accomplished. To assist in rendering this portion of his work as practical as possible, the details necessary to be attended to in forming Joint Stock Co-operative Building Societies, under the Limited Liability Act, are given in a series of facts, and in a carefully prepared deed, to which is added a "form of contract of sale and purchase."

The well-known manner in which working men may, by periodical payments, purchase the houses in which they reside, is fully illustrated in another portion of this little volume, which will be found interesting, as showing how well the author had studied the question at a time when it was less generally understood than at present. Dr. Begg points out the much wider application of which the Property Investment Companies, or Land and Building Societies, is yet capable. The more that the savings of the working classes are invested in such societies, the more do we increase the strength and prosperity of our social institutions. This was pleasingly illustrated in England during the recent time of trial. The £10,000,000 to £20,000,000 lately invested in freeholds and other property by the working classes, especially in Lancashire, constituted to a very large extent the stability of the country during the Cotton Famine. Lord Stanley manifested his good sense and sagacity, quite as much as his right feeling, when he lately expressed a wish that every working man had a house of his own. With that sentiment of Lord Stanley every right-thinking man will cordially concur. It is, as Dr. Begg justly observes, "the strongest foundation on which patriotism can rest, and it may well be called 'the cheap defence of nations.'"

Not the least important or interesting portion of the book is that containing an essay by Mr. James Symington, a working man of Edinburgh, which contains a general and intelligent view of the whole subject from the working man's point of view. This essay gained the first prize of £5 in a competition in which thirteen working men took part.

Mr. Symington, like Dr. Begg, is a strong advocate of the house-purchasing system. "By the payment of a very trifling sum, indeed," says he, "it is within the power of the working man struggling to acquire a house of his own, to derive peace of mind during life; and, in the event of his premature death, the satisfaction that his longed-for property will not be lost, but secured for his sorrowing family, who will be possessed of the means of support and independence, when the arm which previously fought on their behalf the battle of life lies mouldering beneath the clods of the valley."

* "Happy Homes for Working Men, and How to Get Them." By James Begg, D.D. London: Cassell, Petter, and Galpin. 1866.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

I have not been able to include among the foregoing clubs any of those in Scotland, because no returns for this year have yet been received from them; but from the first annual reports, both of Edinburgh and Glasgow, received last year, there is reason to believe the clubs there are exceedingly useful and prosperous.

We must now turn to the consideration of the causes of *failure*, partial and total, in these Societies. They are, of course, very various, and, for the most part, are either closely connected with the particular circumstances of each individual club, or may be classified under the head of infringement or neglect of the general principles I pointed out in a former paper as being, according to experience, essential to success. There is, however, one source of mischief to clubs, from which they have so universally and seriously suffered, that it must be noticed *in limine*, and with all the emphasis which so ruinous and fatal a mistake requires; I refer to the practice of admitting youths as members. The mischief caused by this practice to the club movement generally has been incalculable. It was generally supposed, at the outset, that at eighteen youths were sufficiently aged to be suitable members of a Working Man's Club. Sorrowful experience has proved this to be a mistake, and, moreover, that large numbers have no scruple in declaring they have reached even that age long before it is the case. It seems a great pity to have to exclude those who press in so eagerly; but common sense might have taught us, sooner than experience, that grown men will not sit down for a quiet chat or game where a number of lads are listening to them, or "larking." The men don't complain much; they simply stay away, return to the public-house or the street-corner, and give the club a bad name, remarking that "*they* don't want to be among a lot o' boys." Of course not. Do gentlemen admit juveniles into their clubs, or take their evening's relaxation or amusement in the company of lads, not members of their own family? The grown members of a club do not object to the company of youths when listening to a lecture, concert, penny reading, &c., nor to their partaking with them in general in out-door sports; nor is there any reason against the presence of youths in a silent reading-room; but in conversation, smoking,

* Continued from page 170.

and recreation rooms, it is simply fatal to obtaining the attendance of men.

The best course to adopt, and the reflections which these facts suggest, must be left for the present. I have now simply to implore all persons interested in Working Men's Clubs and Institutes, whether of the upper or the working classes, to accept and act on the results of universal and invariable experience. It is melancholy to see a great movement like this continually checked and maimed by one gross, palpable error, which has been exposed and denounced a hundred times in every possible way. But it is so hard to be wise by other people's misfortunes, and most of us insist on buying our own experience of evil, often at a terribly costly price.

Considering the unscrupulous way in which youths are found to falsify their replies as to their age, I believe, now, that the general rule for admission to Working Men's Clubs should specify *twenty-five* as the age necessary to be attained before they are eligible. It was hoped, recently, that twenty-one would be sufficient, but I fear it is absolutely necessary, if the clubs are to be for *men*, that the former should be the limit, unless the arrangements can be made in a club-house which I shall speak of in a separate paper.

Let us now consider various individual cases of clubs that, although they have had much energy, money, and self-sacrificing zeal bestowed upon them, and have done great good, have not attained that marked success which they would seem to have deserved, and which characterises those above mentioned. In general, the initial letter only will be given of any club whose defects or failures are thus commented on; enough to show that a particular club is being specified, and not merely a hypothetical case. But the club at *Bolton* has been, and is doing so much good, so near becoming a magnificent success, that we need have no scruple in referring to it by name, and specifying what, after a lengthened discussion with its friends and managers, I believe to have been its difficulties and mistakes. They are few, but very instructive.

This *Bolton* Club, then, let me say, possesses the best in-door and out-door premises of any club with which I am acquainted. They have some excellent men on the committee, both working men and a few of the class above them, all working harmoniously, and, above all, they have an able and active secretary. They began (February, 1864) with great *éclat*, originating at a very large and enthusiastic public meeting the previous November, and, for a time, had remarkable success. During one of their first half-years they had 307 quarterly members, paying 1s. 6d. a quarter, 4,396 weekly payments of 2d. each, and 10,509 visitors' payments of 1d. each (for a single night). Two amateur concerts or entertainments were given every week. Several Provident and Trade Societies removed their meetings from public-houses, and rented rooms at the club. Their eighteen rooms, including the dining and refreshment room, were thronged night after night. The gymnasium and skittle-ground were in constant requisition.

A year after (January, 1866), I found the numbers returned were 100 quarterly and 80 weekly, with 300 visitors per week. These are figures high enough to show what an amount of good the Bolton Club is still doing, and unsatisfactory only when we compare them with the former amount, and consider what this society, with its eminent advantages and earnest promoters, ought to be accomplishing. Let us see, then, what have been the hindrances to their greater prosperity.

The first error I would refer to as committed by the Bolton friends is simply that on which I have just dwelt, and in which nearly all other clubs have kept them company—viz., that of admitting youths. The nominal age fixed was eighteen, but large numbers, considerably younger, pressed in. The usual evils ensued.

The next was confining those members who wished to smoke as well as talk, to one room, not very large, *and at the top of the house*. I may be allowed here to say that I fully share the strong convictions which many persons entertain as to the injurious effects of smoking, especially in youths and persons following sedentary occupations. But it is quite certain that if Working Men's Clubs are to answer the purpose for which they are established, smoking must be allowed in the common club-room appropriated to conversation and refreshments, and that this room should be on the ground-floor, or easily accessible, and at least as thoroughly comfortable and inviting as a public-house tap-room. I am aware that the managers of the Bolton Club were hampered in this matter, and could not, at first, well make any other arrangement. I only mention this, among other hindrances, to their greater success. Another serious drawback during their first year was that they were unfortunate in their steward. But, like the previously-mentioned evil, this has been since rectified. A fourth great difficulty (though, had all other things gone well, it might not have been a mistake) was getting saddled with a debt of £700 for furnishing, fitting-up, alterations, &c., in addition to the interest (about £260 per annum) on the remainder of the purchase-money; for this debt bears a very heavy interest, and has been a mill-stone round their necks. A fifth hindrance has been that with all their large and commodious premises they have not got a room large enough to hold more than 130 people, whereas they ought to have had one that could accommodate, for their weekly entertainments, at least 400 or 500, including the members' wives. Next must be noticed the absence of classes and means of mental improvement. And lastly, the admission of anybody, who liked to pay their penny a night, to all the advantages of the club.

Now in talking over the whole subject with the committee, the other day, they said, "Ah, Mr. S., you drew such a beautiful picture of what a club should be, at the public meeting, that we were too enthusiastic, and started on too grand a scale!" "No," I replied, emphatically, "no. You did that which was right and true; and I did not—could not well exaggerate what the club should do and be. Only you did not fully carry out the scheme as I proposed it, and which you rightly, at first, viewed in such bright colours." For instance, I laid great stress on the club being, also, an Institute—on its doing something to promote the intellectual life and growth of its members; but when I reminded my friends that this had been almost entirely omitted, they replied that they had not wished to interfere with the Mechanics' Institute, and admitted that they thought the club should be confined chiefly to purposes of social intercourse and recreation. I urged what I have already laid before the readers of this Journal on that point in speaking of the great principles that should guide the managers of these societies. Then, again, I reminded them that at the public meeting I also dwelt upon the necessity of cherishing a strong corporate "society" spirit among the members, but that these penny admissions of strangers interfere fatally with that. A number of persons come in who have no interest in the club, no bond of union between themselves and one another, or the members of the club. If the somewhat degrading and decidedly unspiritual, but marvellously attractive and tenacious bond of the "pewter pot" is taken away, we must certainly see that some other, equally powerful, if possible, is substituted in its place. In too many clubs, while the attractions and *nexus*, the uniting principle, of the public-house have been righteously discarded, the higher elements have not been sufficiently introduced. No public spirit, no warm and deep attachment to the club has, in consequence, been evoked. The vacuum has not been filled up which yawns in most working men's minds at the end of the day's work; nor have their animal, social, and intellectual craving been satisfied. No wonder that clubs have not been a uniform success.

But the Bolton men would have been working quietly and successfully through all these drawbacks but for that heavy debt of £700, at eight or nine per cent. And there I cannot help thinking, with all deference, that both the working men and their employers were somewhat to blame. If, when the first enthusiasm for the club was felt, and its great advantages thoroughly appreciated, the members had tried, and been encouraged by the capitalists, to raise the required sum in shares instead of borrowing it, might not this have been accomplished? The men would have been putting forward self-help, and wealthier people, seeing this, ought easily to have been induced to do more than they did. About £1,200 was generously raised among the middle and upper classes, but if the men had put their own shoulder to the wheel, doubtless a few hundreds more would have been willingly given. Now, I think that one main reason why more was not attempted by the members of the club was because they had not enough of that corporate spirit above referred to. Had they felt as many working men do when they have formed a Friendly, Trade, Co-operative, or Temperance Society, the Bolton Club would long ere this have been all it ought to be. Had they merely knocked two rooms into one, or run up a temporary "lean-to," for their entertainments, which the masons and carpenters among them ought to have been able and willing to do very cheaply after their day's work, they would have taken several pounds a week during the winter months, and be rapidly paying off their debt. Let them see what those Buersill spinners and weavers did in their own county, and while labouring under the same difficulties arising from the cotton famine.

On the other hand, many clubs might learn from the Bolton managers and promoters a lesson of liberal giving and devoted work, which might, perhaps, have been all that it was necessary to draw from their history had they not been "as a city set on a hill," and had they not done so well that it is impossible to help regretting they have not done better.

(To be continued.)

Things Talked About.

A splendid compliment was paid by Mr. Gladstone, in his Reform Bill speech, to the Rochdale Pioneers. When enumerating some of the boroughs where the working classes deserved a larger measure of enfranchisement than they now possessed, he said—"There is a town that deserves special mention—I mean the town of Rochdale—not only on account of the distinguished man (Mr. Cobden) by whom it was about twelve months ago represented, but for another reason; it is the town that probably has done more than any other town in making good to practical minds the case for the enfranchisement of the working class; the town where originated that remarkable system—at first sight, I don't hesitate to say, that most perilous system—of ousting the trader and taking into their own hands the means of their supplies, and who, by their intelligence and self-guiding power, brought to a successful issue what has been a source of the greatest comfort and profit to themselves."

Four gifts of books, maps, and other aids to knowledge, of the value of £15 each, are now vacant under the provision of the trust deed by which the fund raised as the working men's memorial to Sir Robert Peel, was invested for the purpose of devoting the proceeds to gifts to public libraries, mechanics' institutions, reading-rooms, &c., in the United Kingdom maintained by working men. Forty-one institutions of the kind have already received gifts; and now, as we have said, there are four donations to be made. Working men's clubs would be very fitting recipients; and, for the information of committees and secretaries, we may state that applications must be made, on or before the 10th of April, to the secretary of the University College of London.

A curious—let us hope, extreme—specimen of the public-house benefit societies has within the last few days been brought under the notice of the Manchester police magistrate. Thomas Lomas, the landlord of the "Dog and Partridge," Oldham Road, was summoned, as the treasurer of the Odd Fellows' Equitable Assurance Society, for refusing to pay to a widow, named Jane Adams, the sum of £4, which she claimed in respect of her husband's death. The deceased had contributed for eighteen years to the society, and after his death application was made for money to pay for his burial. The widow was then told that the funds were exhausted. The magistrate held that the defendant was liable, and ordered him to pay the money. Another and similar case was then gone into. The collector of the society gave some striking evidence. "He was appointed collector, about twelve years since, by a man named John Lancaster, now dead. One of the committee was Thomas Mason, a man eighty years old, who lived now in one place, now in another. Witness had never seen any of the committee during the past three years. The members, 150 in number, and all poor people, were never called together by circular, the only business transacted being the collecting of money. Witness had received 7s. per week in subscriptions for the past eighteen months. No notice had been given to the members of the society's stoppage." In this case, too, the defendant was ordered to pay the amount, and it was intimated that he had a narrow escape from a more serious charge. We fear that many more of the so-called friendly societies, got up by publicans, are in what is sometimes called a "very shaky" state.

The miners' dispute in Devonshire and Cornwall is assuming formidable dimensions. There was a very remarkable gathering on the 13th inst., attended by about 1,000 miners of each county, at a spot—the summit of a lofty hill—commanding a magnificent prospect, where, in other days, many an important conference has taken place. Females were present, and the somewhat unusual preliminaries of singing and prayer ushered in the business of the day. For five hours the discussion lasted, and ultimately the following resolutions were agreed to:—"That this meeting declares that, as an association, we are determined to stand by our rules

and maintain our society;" and "That, as all loyal subjects of Her Majesty, we will put ourselves in communication with the Secretary of State, and demand protection." It was further agreed that a deputation of miners should be appointed to meet the landowners, adventurers, and captains, in consultation, in order to bring the present dispute to a close.

A novel international exhibition will take place at Archachon, near Bordeaux, France, in July next. The Minister of Marine and the Colonies will preside; and the Commission invite, "from the seaports of their own country, and the fishing ports of their maritime neighbours, contributions to the exhibition. These are variously classed, and comprehend specimens of cured and preserved fish for food; oil for use as medicine; chemical products extracted from seaweed; shell, amber, pearl, colouring matter, &c., in connection with art; industrial products, such as oils, skin, whalebone, sponges, &c.; marine manures, shell, sand, and seaweed. Another class includes tools and machines for making boats, models of fishing-boats, of oyster beds, and of salmon ladders; lines, nets, and fishing apparatus, and oyster dredges. Then there are instruments for preserving and smoking fish, with plans and models of curing establishments, and descriptions of modes of packing and transporting fish. There will be collections also of memoirs on the subject of fish and fish culture and management, with plans, charts, drawings, and photographs. For these, prizes will be awarded according to their respective merits; and the cost of transporting the articles for exhibition will be borne, either altogether or in part, by the administration of the exhibition." Less showy, perhaps, but certainly not less useful than preceding international exhibitions, this display promises valuable results. Articles for exhibition must reach Archachon by the 18th of July, and the entry of the articles is desired to take place early in April.

Hitherto agricultural labourers have not taken a prominent part in organisations for the maintenance of wages. Indeed, with the exception of the eight famous Dorchester labourers who, in 1834, were punished for belonging to a secret society, the farm labourers have been singularly quiescent under great hardships. But some of the Kentish labourers are now moving in earnest. From 400 to 500 have gathered at Maidstone for the purpose of concerting measures to obtain a higher rate of wages. They ask for sixpence a day more, and twopence in the shilling advance upon the present scale for piece work; to leave work at four o'clock on Saturdays, and to have fourpence an hour for overtime. A memorial, with nearly 1,000 signatures, will be presented to the farmers of West Kent.

The masters and men in the building trade at Wolverhampton have made an amicable and rational settlement of the dispute between them. They have met and discussed the points raised in a friendly spirit, and the result has been that the demand for a farthing an hour more, a Saturday half-holiday, and some other minor matters, were conceded, and the men have resumed work in the best possible spirit.

In reference to the building trades, we note that Mr. George Potter, whose name is so familiar in connection with the London association, has been presented with a purse containing 300 sovereigns. Mr. White, M.P., presided, and Mr. Maley, M.P., and Mr. Alderman Lusk, M.P., were among the contributors.

A very determined effort in favour of the nine hours movement has been made among the men employed at the York works of the North-Eastern Railway Company. More than 900 of the men memorialised the company without effect, and now the whole body of workmen have resolved to work no longer than fifty-four hours a week. A large number of the permanent way men are already out on strike, and it is thought the movement will extend to other parts of the line.

A conference of delegates representing the journeymen tailors of all parts of the country, has been sitting at Manchester. The most important determination yet aimed at is that all the tailors' societies in the country shall be amalgated, and a code of rules agreed upon.

Nottingham has now a cheap and good working men's dining-hall, opened on the 14th inst. by Mr. Ball, the mayor. 300 persons can dine at one time, and the Glasgow scale of prices has been adopted. The more of such halls the better for the man who wants a good dinner, and who is necessarily compelled to limit himself to a very moderate price. The abominable fourpenny plate and penn'orth of pudding of the cheap cookshops have reigned too long.

Messrs. Samuel Lees and Son, cotton-spinners, of Lees, have been fined £5 at the Ashton-under-Lyne County Sessions, for allowing five young women to work after hours.

A meeting of the guarantors of the Yorkshire Fine Art and Industrial Exhibition has been held at York, the lord mayor presiding. The exhibition will open on the 24th of July, and remain open until the end of September. It is to be hoped that the character of an industrial Exhibition will be better preserved than in some others of the class.

We see that some of the working men exhibitors at Guildhall have held a meeting to protest against the perversion of the objects of the City Exhibition by permitting firms to exhibit.

Co-operative Intelligence.

The Equitable Pioneers' New Stores.—The committee of the Rochdale Equitable Pioneers Society (Limited) have accepted the tender of Messrs. Harrison and Birch, for the erection of their new premises, situate in Toad Lane and St. Mary's Gate. The premises consist of three shops upon the ground floor, with storerooms in the basement storey. The second storey will contain a showroom for drapery, storeroom for grocery, and large, well-lighted offices. The third storey will contain a library-room of an area of 150 superficial square yards, a well-lighted news-room containing 170 superficial square yards of area; also two committee-rooms and a waiting-room. The fourth storey will be suitable for a meeting-room, and capable of seating 1,500 persons. The fronts of the first storey will be built entirely of Ashlar stone polished, forming pilasters betwixt each window and door, and each stone will contain a raised moulded panel upon the face and returns; each pilaster having a moulded base, and caps with frieze and moulded cornice over all the shop doors and windows. The exterior of the first storey is in the Gothic style of architecture, having neat moulded string and springing courses, and columns with moulded bases and carved capitals to each window, with moulded and arched heads cuspated, and all the intermediate space filled in with pitched-faced pierpoint walling; finishing with moulded neck mould and cornice, except over the circular part opposite the junction of St. Mary's Gate and Toad Lane, and there is a panelled gable containing the initials of the society, the year when it was established, and the date of the intended erection. Surmounted upon the top of the same is a beehive, supported upon each side with a cornucopia emblematic of industry and its results. The total height of the building, from the footpath to the top of the stone cornice, is twenty-two yards. Mr. James Cheetham is the architect. The building is intended to be completed in twelve months from the signing of the contract.

Welford, Northamptonshire.—On Thursday evening, March 8th, the fifteenth general quarterly meeting of the members of the Industrial and Provident Society (Limited), established in the village, was held in Mr. Garlick's school-room, kindly lent for the occasion. Upwards of forty members were present; Mr. John Wilson, the treasurer, in the chair. From the financial statement and balance-sheet laid before the meeting by the secretary, and unanimously received and adopted, we learn that the sale of goods at the store for the thirteen weeks ending February 21st, amounted to £461 (upwards of £35 weekly); of this sum, £417 13s. 2d. was laid out by members, and £43 6s. 10d. by non-members. The net profits, after payment of all expenses of management, rent, &c., were £39 8s. 0½d., from which a bonus of 1s. 9d. in the pound on members' purchases was declared and paid, amounting in the aggregate to £35 6s. 6d., leaving a balance of £4 1s. 6½d. carried forward toward the current quarter's account. The society numbers seventy members, with a subscribed capital of £214 19s. 10½d. A unanimous vote of thanks to Mr. Garlick for the use of his room closed the business of the meeting.

Friends of Labour.—The officers and friends of the Chelsea Friends of Labour Loan Association celebrated, on Tuesday, the 13th inst., their seventh annual meeting by a dinner at the "Commercial Hotel," King's Road, Chelsea. Mr. J. P. James, the founder of the society, occupied the chair, and Mr. Riley, of Waller's, builders, the vice-chair. Mr. C. E. Ruffy, the secretary, read the report of the operations of the institution since its commencement some seven years ago. From the report alluded to we find that they began with twenty-four members and a quarterly income of £7 14s. 7d.; expenditure, £1 6s. 10d. Now they have 186 members, and a quarterly income of £511 2s. 7¼d., with advance to members and others during the same period of £438 7s. 5½d. The society had advanced in loans from its birth to the end of the present financial year, the sum of £4,590. This was done at the small rate of 5 per cent.; the secretary wisely adding that such great results from small beginnings showed the value of Co-operation in money matters, as well as in grocery or merchandise. The evening's entertainment was enlivened by songs.

Dalton Equitable Industrial Co-operative Society (Limited), Dalton-in-Furness.—This society was established in 1861 by a few poor miners, who persevered against all obstacles triumphantly. All the shopkeepers in the town combined for its overthrow, and even issued tin checks similar to those given by the society on purchases, and promised to pay a dividend of 1s. in the pound to their monthly customers, at the same time declaring the society's dividend to be false, and stating that when contributions ceased the dividend would cease at the same time. Some of the leading men in the town handled the reports severely, and pronounced Co-operation to be a bubble that would soon burst. On Saturday, 17th February, the society held its fifth annual tea-meeting, at which over 200 sat down to a substantial meal. After the tables were cleared the large room was crowded to hear a lecture by J. C. Furn, of Eccles, near Manchester, on Co-operation.

General Information.

CLUBS AND INSTITUTES.

Working Men's Club and Institute Union.—Notice.—The council beg to give notice to the committees and secretaries of metropolitan working men's clubs, that the next monthly tea-meeting will be held at their office as usual, 150, Strand, on Wednesday, the 28th instant, when they will be glad to see any representatives either of London or country clubs. Tea at seven o'clock. A card of invitation is being prepared, which will be forwarded to the secretary of each metropolitan club, and which (should neither himself nor any member of his committee be able to use it) he can hand to some other member of the club who may like to attend the tea-meeting. It is to be returned to the secretary of the club after each meeting, if not used by himself.

The Essex Road Working Men's Club, Islington.—The Rev. H. Solly gave a very interesting entertainment to the members of this club, on the evening of Thursday, the 15th instant, upon "The Hand, the Hoof, and the Wing," illustrating it with diagrams and some (bony) specimens of, among others, a horse's leg and a human arm. The beautiful harmony of creation was most minutely but yet clearly demonstrated by the wonderful agreement there is between the formation of the members of a whale, seal, or dolphin, and that even of an elephant's leg, the wing of a bat, and the human hand. The bone in the fin was answered by a bone in the leg, and the bones of a horse's fore-leg were traced in the arm of a man. The hoof was shown to exist in a man in the shape of his nails, and these again were transformed into feathers in a bird. The hand was one of the great features of superiority which distinguished him from the rest of creation. The monkey had something like it, and so had the sloth, but neither of these possessed such adaptability as the thumb gave to the human hand. The hough joint of the horse's hind-leg does not answer to the knee, but to the heel of a man. The learned gentleman wound up by showing how any man, without his moral, intellectual, and spiritual faculties, and the culture of them, was exactly like an animal of simple bone and flesh, and made an earnest exhortation to the members to keep up that excellent repute which their club had gained. We may say, among the many comforts and advantages it possesses, not the least is a French class, at which any member can learn that language of a very efficient master, M. Louis Spanier, for the trifling sum of 1s. a quarter. The evening was divided into two parts, by a reading, given by Mr. G. Kimber, of "Samson's Soliloquy on his Blindness," from Milton. We understand that a discussion on the subject of "Jealousy and Matrimony" is going to be brought forward on the 6th April, and the question of the "Reform Bill" on the 10th.

Bradford Working Men's Club.—On the 12th instant, at a discussion meeting connected with this institution, Mr. James Hanson read a paper on "Political Economy—What is it, and would its study be practically useful to Working Men?" The chair was occupied by Dr. Bridges. After the reading of the paper, several persons addressed the meeting on different points brought forward by the essay.

Horton Lane Mutual Improvement Society.—The seventh public lecture of a course, delivered under the auspices of this society, was given by Dr. Parkinson, on Monday evening, in the Horton Lane Lecture Hall; the Rev. Dr. Campbell in the chair. The subject of the lecture was, "An Hour on Chemistry," with experiments. The attendance was pretty numerous. Dr. Parkinson, after being introduced by the chairman, commenced by remarking that, in the short space of time he had that evening, it would be an impossibility to give a connected idea of the science of chemistry; but he would give an outline of a few elementary principles, illustrated with experiments, familiar to most of his auditors, and make explanations as he went on. Dr. Parkinson next explained and experimented upon the force of chemical affinity in substances which mutually produced a strong attraction, but until contact was made between them the affinity could not work. He also showed the changes produced in various substances as the result of elective affinity. The separation of a simple element from its compound was then shown in the case of silver, which was taken from a liquid compound. The elements of substances were the building-stones in the chemical edifice. He noticed the element in oxygen, constituting as it did so large a portion of substances, but not as a gaseous body, except in the atmosphere, where it existed in its elementary nature. The lecturer explained the different degrees of heat as simple combustible substances and as compounds, and also the effect of solid matter intensely heated. The lecture and experiments were most pleasing and instructive.

Establishment of a Working Man's Club at Ilkeston (Derbyshire).—A meeting has been held in the Boys' National School-room, Ilkeston, for the purpose of considering the propriety of establishing a Working Man's Club at Ilkeston. The chair was taken by the vicar, the Rev. James Horsburgh, and several ministers of other denominations were present; there was also a large attendance of working men. It was unanimously resolved, "That a Working Man's Club be

immediately commenced, and that every member use his utmost endeavour to promote the success of the same." At the close of the meeting several working men paid their subscriptions, and were enrolled as members.

York Working Men's Club.—On the 12th inst. a very pleasant and enjoyable tea party was held in the large room of the above club. The room in question is used for the Wednesday evening (weekly) concerts in connection with the club, and also for lectures, tea parties, &c., promoted for the purpose of aiding the club funds. To make it as neat and attractive as possible, it has undergone a thorough renovation and decoration at the hands of Mr. Masser, of York, artist. It now looks quite beautiful, and was the admiration of all those who were assembled at the tea party. The tea was a very excellent one, and was provided by the steward and stewardess of the club, Mr. and Mrs. Dodsworth. The room was well filled with a respectable company, who were presided over by Mr. R. Mosley, who expressed himself delighted to meet so large and happy an assemblage. He dilated upon the benefits of such social gatherings, and suggested that there was no reason why they should not be held at least every quarter.

STRIKES.

The whole of the labourers belonging to the Board of Works, and Mr. Kirk's men employed by contract in the Royal Arsenal at Woolwich, have struck work on the one o'clock Saturday half-holiday movement. They have presented a memorial, which implies a desire to be paid by the hour, and only for the time employed. Some of the Government men have been reinstated on their own terms. There are still about 300 men who have not been restored.

WAGES AND SHORT TIME.

The Short Time Movement.—A meeting of the persons connected with the baking trade has been held at St. James's Hall, Piccadilly, for the purpose of effecting a reduction in the hours of labour of the bakers in the metropolis, and an increase of wages. Mr. T. Thompson presided, and congratulated the meeting on the spirit that was evinced by the trade as exhibited by the attendance of so large an assembly on a night when the members of that trade were worn out by the toil of the week. He vindicated the introduction of the question of wages into the subject of the objects submitted to the meeting, because it was really practical. Food had increased in price, and it was necessary that there should be an increase of wages. Some of the employers had met the requirements of the working body of bakers, who were journeymen, but something else was required. Night labour in the baking trade should be abolished as unnatural, unnecessary, and unjust. Work from five o'clock in the morning until five o'clock in the evening was quite sufficient labour for persons employed in an unhealthy occupation, and one that exhausted physical strength. Mr. Taylor and other persons addressed the meeting, and a series of resolutions in conformity with its objects were unanimously adopted.

Conviction for Leaving Work without Notice.—On Saturday, the 10th instant, the Stockton magistrates held a special sitting, to hear the cases against more of Messrs. Pearce and Lockwood's men, operative iron shipbuilders, who were summoned before the Bench for breach of contract. There were four cases, and the first gone into was that of William Atkinson and Charles Rutter, iron ship shell-riveters. The defendants had entered into contracts to do part of the shell plating of two ships in Pearce and Lockwood's yard, but on the 16th ult., with the general body of the men, they left their work. The magistrate found them guilty, and sentenced them to one month's imprisonment with hard labour. Mr. Stevenson asked for a case for the Court of Queen's Bench. The case was granted, the defendants being admitted to bail, themselves in £50, and another surety of £50. The next case was against Morris Welch and Robert Crowther, shell-riveters, and was precisely similar in its nature. Each defendant was sentenced to a month's imprisonment, but admitted to bail. The men employed at the railway works at Darlington have, in conjunction with men at other places, made representations to their employers desiring them to remit one hour per day from their labour. A meeting of the men for receiving a deputation from the workmen on strike was recently held at Darlington, when it was agreed to support the strike. A collection was made for the men on strike.

The Wages of Factory Operatives.—The manufacturers and cotton-spinners of Preston have just had a general meeting to consider a memorial sent in to them by the operative spinner and self-actor minders for an advance of wages and the re-construction of their list of prices; and after some discussion it was agreed to increase the rate by 7½ per cent. until the list has been duly revised. Many firms in the town had increased the wages of their operatives voluntarily, and before any application at all was made to them. The operatives of Preston belonging to the Power-loom Weavers' Association, lately applied for an increase of 10 per cent. Their employers have expressed their willingness to give them 5 per cent., but this they refused; and they have appointed deputations to wait upon each employer and ask for an increase of 10 per cent., in addition to the 5 per cent. offered. They have also decided to establish an emigration society in connection with their association.

Correspondence.

*** *We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE PROPOSED EDUCATIONAL FRANCHISE.

To the Editor of the Working Man.

Sir,—I have perused, with great interest, your editorial appeal to working men to ascertain and report the views entertained by their own class upon the Bill introduced into the House of Commons by Mr. Clay. You tell us, "It will fare ill with working class interests in the future—it will discourage members of Parliament, anxious to promote the advancement of the people—if no attention should be given and no trouble taken to throw light upon a measure introduced with friendly intent towards them."

Now, sir, I must admit it seems to me very strange that such old politicians as those who have introduced the Bill really anticipate an immediate and spontaneous approval of a measure which, although designed "with friend's intent," has been framed without the knowledge of the great bulk of the working community, and which there has been neither time nor opportunity to discuss. Those honourable gentlemen, whose good intentions I fully appreciate, must surely know that to thoroughly rouse public opinion in favour of great questions is a work of time; it is an arduous work, demanding incessant, unremitting labour. That labour invariably falling upon the *few*, who, in their zeal for what they believe to be a good cause, manfully contend with ignorance, obstinacy, scorn, and misrepresentation. No great question was ever yet carried without there being such workers, and my own view is, that without the persistent exertions of men who will never say die, no great measures can succeed. It is not simply saying to the people, "Here is a plan designed for your advantage," that will induce them to regard it with favour. Their prejudices must be combated, and their suspicions allayed by appeals, repeated again, and again, *and again*, if needs be; and if ever there was a case in which prejudices would have to be combated, it strikes me very forcibly the advocacy of this Educational franchise is one.

I know something of the views of my own class. Independently of a past connection with working men's organisations, my daily avocations constantly bring me into contact with a very wide circle of men in various trades. The old leaven of Chartism is not yet dead. The mass of those working men who are interested in political matters go in for manhood suffrage. That is their ideal. It is true that, owing, most probably, to the influence of Mr. Bright and others, there is an apparent inclination to accept a mere lowering of the present qualification for the franchise, but only as a step. Nineteen out of twenty mean manhood suffrage ultimately.

For myself, I willingly admit that manhood suffrage has no charms for me, with my present knowledge of what working men really are. Do not think that I desire to be a detractor of my own class. Assuredly not. But it would be wicked folly to claim for them the possession of those virtues and that knowledge which will make them brave and incorruptible citizens. I say knowledge, for I hesitate to approve—nay, more, I protest against—any system that confers duties upon men who are utterly ignorant of the obligations and responsibilities of such duties. Now, in my view, the exercise of the elective franchise is a solemn and responsible duty, and can only be rightly exercised by those having a knowledge of those responsibilities. But how few, even of the middle classes, to say nothing of working men, have a clear idea of the duties of electors and elected! Is there one in ten? I doubt it. With such ignorance, no wonder that the screws in the political machine are continually getting loose, and that there is a perpetual tinkering and botching going on. Will the admission of more of this ignorance, to help to work the machine, tend to render its working more smooth and satisfactory? By no means. Intelligence, not numbers, is required. Hence, I regard the Bill of Mr. Clay as one of the grandest steps towards securing a perfect government that has yet been taken.

You will, however, observe that with such views I am prepared to go further than that honourable gentleman. In truth, I do not think his Bill, strictly speaking, is an educational one. Reading and writing are not education. They are only means. I would restrict the extension of the franchise to those who were able to state what are the duties, both of electors and the elected. I know there would be difficulties at the outset, but I believe they are not insurmountable; at any rate, I, as an individual, should advocate such a high standard, believing 'tis wise to look high enough.

The *principle*, then, of Mr. Clay's Bill meets my cordial approval. Many of the details are objectionable, but it ought to be supported, nevertheless. I have no faith in any general move in its favour, in the absence of an earnest thorough-going propaganda. "A little leaven leavens the whole." We want a little leaven. The subject is new, it is novel, it is opposed to the political teaching the working classes have received; hence I see the difficulties of the work.

I have written thus freely, not in view of publication, but that you might convey to those who, I see, have solicited your co-operation, what are the views of one who believes he has some knowledge of the opinions and habits of his own class. As far as my avocations will permit, I shall be happy to co-operate with any of my fellow workers in London in evoking sympathy in favour of the Bill. But the first step is the organisation of a *propaganda*.

Apologising for trespassing so far on your time, I am, yours respectfully, W. Glazier.

2, *Mildmay Street, Islington, N., March* 12*th*, 1866.

To the Editor of the Working Man.

Sir,—If you will kindly grant me a small space in your valuable paper, I should like to make a few of my opinions public upon the great question of Parliamentary Reform. Myself being a working man, working for a weekly wage, ten hours per day, you cannot expect very valuable political opinions from me.

You ask, Would the working man trouble himself to go through the formula of examination in order to possess a vote, as would be required should Mr. Clay's Bill pass? In my humble opinion I beg to say, No, he would not; and allow me to ask, Why should he?

Why, indeed, should I, after having done my ten hours' labour, be compelled to go through another school drill in order to get that which I am at present entitled to, when at the same there are many who have that privilege whom I be bound could not write the word you put forth as an example in your last week's impression—many of the members of our boards of guardians, to wit.

I, sir, want a vote. I pay £20 per year rent, and therefore am qualified, or ought to be; but here one of the blunders of legislation occurs: the houses are what is termed farmed, so that I pay a weekly rental, taxes included, by which process I am deprived of a voice in governing those who govern me.

There appears to me to be a great fear in the middle classes of society that if the working classes were enfranchised, they—the middle classes—would be swamped at the hustings. Now, sir, as it is certain we have a middle class, we must of necessity have a first and third class. The first and second are well represented at present, for they have it all to themselves, and the third you yourself own are not represented at all. I consider the franchise quite low enough at present. I am not an advocate for very adventurous measures, especially when such great stakes are to be played for. I think the present would suffice until the time arrived for another Reform Bill, which is not very far in the future, let this one be framed in whatever form it may. Let the qualification rest on the rental actually paid, and have nothing to do with taxes or tithes whatever; this would also revolutionise our present, in many instances, corrupt parochial boards. For, if the franchise be lowered to £2, how shall I, even then, have a right to vote if I do not pay the taxes direct? Then, again, the upper and middle classes have their representatives; why should not the workman have his also? elected by himself, entirely separate from the others, and yet working together in the one House for the good of the whole community: by this simple means the workman would be fairly represented, with no fear of the middle classes being swamped, or the unnecessary imposition on the workman of again reading himself up in school books or lowering the franchise. If, as Mr. Clay proposes, the unenfranchised must be examined, surely many of those who already have the privilege require to be examined, and taught into the bargain. I think his proposition is far from fair, and rather degrading to some of our feelings. All honour to his good intentions towards us for all that! I can scarcely think the present members of the House of Commons—not our members, bear in mind, for we have none—can be aware of the evils arising from the present system of allowing the house owner to place a whole street under one parochial rating, and thus deprive the householder from a voice in the affairs of his home and country, under the assumption that he gets his house at a lower rental.

Trusting that I may see these few remarks in your next week's impression, I remain, dear Sir, yours very respectfully, Richard Gale.

16, *Margaret Place, Margaret Street, Hackney Fields, N.E., March* 12*th*, 1866.

To the Editor of the Working Man.

Sir,—I have asked the members of the Whitechurch Working Men's Club their opinion of Mr. Clay's Bill for the extension of the franchise, and they think it much better than a brick and mortar franchise; but think an examination in English constitutional history, political economy, and general knowledge, better than the writing and arithmetic test. They think this, because they know many working men who are fair scholars, but who are deficient in general knowledge. They also know some who are not well educated who possess superior intelligence; but they think an extension of the franchise without voting by ballot would be nearly worthless. In fact, they would not apply for a certificate unless they could vote freely and secretly, feeling sure that without the ballot they would be obliged to vote as their masters should wish them.—I am, Sir, yours respectfully,

John Smith, Secretary.

Whitechurch, near Blandford, March 15*th*, 1866.

To the Editor of the Working Man.

Sir,—After reading your article of the 10th, I understand it as an appeal to us working men to show the members of Parliament what we think of Mr. Clay's Bill, and further, whether we would take the trouble to attain a sufficient knowledge to qualify ourselves for the franchise. Well, sir, I have much pleasure in stating that I, with many more in the town I reside in, would feel more satisfied if we could record our votes in a way more becoming to us as working men, than through mere bricks and mortar. We feel ashamed of our present privileges. I have two: first, by birth; second, just because I can pay £10 rent and taxes, which, according to the present state of things, makes me, in the eyes of the law, wiser than my fellow-workmen.

Sir, we should feel it a delight to set to work to qualify ourselves for Mr. Clay's franchise, or any other on an intellectual basis, which is, we think, the best way our Legislative gentlemen can stop fools from holding the rights of wise men.

Trusting the Bill—the one we working men desire—will

meet with success, both in and out of the House of Commons,—I remain, Sir, yours obediently,

Shrewsbury, March 14th, 1866. A Shoemaker.

P.S.—We should be glad to have some idea of what would be required at the examination.

To the Editor of the Working Man.

Sir,—It gives me great pleasure to see that the columns of your valuable paper are thrown open for the expression of working men's opinions of the Bill lately introduced to the House by the member for Hull.

For a long time I have been firmly convinced that a franchise based upon intelligence would not only be a safe measure, but one best calculated to raise the social, moral, and intellectual condition of the people. Such a measure is Mr. Clay's, and I do hope that it will receive the sanction of the Legislature. The lowness of the registration fee is a grand feature in Mr. Clay's Bill, because, should it become law, there will be no excuse for any one surrendering his liberty into the hands of the electioneering agent. That Mr. Clay's Bill would be allowed to lie upon the shelf is not likely. We have too long and too ardently desired enfranchisement for such a thing to take place. Work and trouble are not usually feared by the working men of England, nor will anything, in reason, be feared or neglected that leads to citizenship.

Let the Legislature pass this Bill, and depend upon it in a few years the office of examiner will be anything but a sinecure.—I am, Sir, yours truly, A Son of Crispin.

Shrewsbury, March 14th, 1866.

To the Editor of the Working Man.

Sir,—As you solicit the opinion of working men upon Mr. Clay's Franchise of Intelligence Bill, I beg leave to offer my opinion. Before doing so, I wish to give my opinion of your publication, the Working Man, which I have read attentively from the first. I wish it every success, and hope it will be widely circulated, believing that those who read it will be greatly benefited thereby, as has been my case already. But to your question, What do working men think of the Bill? I quite agree with it, and thought it so likely to become law, that I advised my eldest son (who is nearly nineteen) to practise his writing and arithmetic, as he, like many youths learning a trade, does not practise what he learnt at school. This, also, being my case, I have had to learn since I was twenty-one years of age. I think such a Bill would induce parents to educate their children more, as well as educate themselves. I think it very reasonable that every person should know the first four rules of arithmetic, and dictation, before they are qualified to vote for a member of parliament. If it should compel every one to learn as much as a boy of eight or ten knows, or ought to know, so much the better. Next to manhood suffrage, I think it is as much as can be expected; and I should think that no working man would think it too much trouble to prepare and go through the examinations; if he would, then I should say he did not deserve a vote. I have worked at my trade (tailor) for thirty years, and in some of the largest shops in London, and, from my knowledge of working men, I should think it a very easy task for them to qualify themselves for a vote under Mr. Clay's Intelligence Bill. I am afraid the poor agricultural labourer would fall very short. There was not one out of a dozen that I asked a few months ago that could either read or write, or ever heard the names of Messrs. Cobden and Bright.

Trusting that many working men more able than myself will forward their opinions, so that M.P.'s will have a better opinion of them,—I am, Sir, your obliged reader,

March 12th, 1866. A Working Tailor.

To the Editor of the Working Man.

Mr. Editor,—As a working man, and in accordance with your request, the writer would humbly place a few remarks at your disposal on the various points set forth by you, and on which, no doubt, you will receive a variety of ideas. As regards the Bill introduced by Mr. Clay into the House of Parliament, it would, on the score of intelligence, only admit a very few of the working class, as a majority of them are but indifferently educated. But yet they are well informed, by means of the clubs and the various kinds of means now in use for their improvement; so they are in a fair way of becoming a most exemplary portion of the community.

But I do not see what kind of test would be the standard of their fitness for the franchise, as I have found, in my experience among working men in London during the last forty years, that good mechanics as workmen are sober and industrious, and well acquainted with the work they were employed in, but very dull on everything else. The truth is, good workmen are so intent on mastering their respective trades, and so desirous to excel in them, that, as a rule, they care for nothing else. When I came to London, forty-three years ago, I was very much surprised at the few who could read or write, or do the simple rules of arithmetic. But I trust the times are altered, and the working class improved. About two years back I put an advertisement into the *Clerkenwell News* for contract for painting a house I was doing the carpenter work of, and for which I had about forty applications, and out of this number there were only four that were set forth intelligently, or in any way business-like, and yet all the applicants, in conversation, were quite intelligent.

Another thing I would mention is, that the working men will, as a rule, detest forms and troublesome observances. To be enabled to vote, they will want something in the required form to be very plain and, at the same time, attractive. There are many now who could have a vote, but there is a trouble about it, and they don't understand the way to go about it; and more than this, they want those who do know the way to call on them, and show them how to act, and lead them on to it. I agree with you, that all clubs and societies of intelligent workmen should meet as early as possible and discuss the merits of Mr. Clay's Bill.

Excuse an old working man, who has little time to study.—Yours most respectfully,

A Constant Reader of your Productions.

March 9th, 1866.

To the Editor of the Working Man.

Sir,—In answer to your leading article in the Working Man of the 10th inst., I wish to offer a few remarks on the *Intelligence* principle. My opinion is, that Mr. Clay's Bill *is likely* to lie on the shelf, because it will no doubt lead to universal suffrage; and *that* will not be accepted at present, because it will be too great a change at once—and Englishmen are generally in all matters adverse to violent changes.

Mr. Clay's Bill is a step in the right direction, but rather too long a stride: it wants modifying. Intelligence is power; but it has been observed, that it is not always virtue. There are thousands of men in the United Kingdom who can read and write sufficiently for Mr. Clay, but are men of no stability of character whatever. Men are more or less religious and moral, and also social, as well as intellectual; and the men that are sent to Parliament are sent there to attend to the social, religious, and moral, as well as the intellectual, affairs of the nation; and, as such, are, or ought to be, men of character—men of intelligence, well known for their morality and social virtues; and unless *electors and voters* are men of that stamp themselves, are we likely to continue to have such men sent to Parliament if *intelligence* is the only qualification to send them there?

Suppose Mr. Clay's Bill is modified thus, viz.:—A man to be qualified for a voter should—in addition to the required amount of intelligence—be a member of some Christian community, or a depositor in a post-office or some other savings bank, or a member of a legal benefit society, or have a policy in the Government or some other insurance society, and be of some regular calling or occupation.

Any one reading this may think it too strict, or may doubt the practicability of it; but the plan I would suggest is this—that any man wishing to have a vote should be able to procure a printed form from some parochial officer—this form to be taken home and filled up by him—and in this form he should have to give his name, address, occupation, his employer's name, what Christian community he belongs to, whether a depositor in a savings bank, whether his life is insured, or a member of a benefit society; and the very fact of his being able to fill up the form correctly, would be sufficient evidence of his intelligence—the man's word and the employer's signature should be a guarantee of its truthfulness. The form, thus filled up, should be sent or taken in for consideration, according to the terms of the Act.

Now, something of this kind would not take up any time that a working man could not spare; and, besides that—when he states that he belongs to such-and-such a Christian community, you have evidence of his religion and morality; when he states his occupation, you have evidence of his industry; and when he states that his life is insured, or that he belongs to a benefit society, you have sufficient evidence of his social virtues; and if you have any, or all, of these qualifications in voters, you have the best possible guarantee of their sending men to Parliament who will maintain the character of the country, the welfare of the people, and social and commercial intercourse with all nations. I hope I have not encroached too much on your space; and, in conclusion, accept my well wishes for the success of the Working Man.—Yours, &c.,

J. T. Rhodes.

CO-OPERATIVE EXHIBITIONS.

To the Editor of the Working Man.

Sir,—I have seen in your paper called the Working Man, to which I am happy to say I am a subscriber, several hints on working men's exhibitions, and have watched the dissatisfaction that has arisen from what some call unfair dealing. Now, sir, I am a working man myself, and an exhibitor, besides a medal winner. I wish to refer to your good judgment, if you think a mere honourable mention—without even a word of thanks for his trouble—is a sufficient recognition of the labours of a poor person who has worked night and day to get up the article he exhibits to the best of his abilities. Now, sir, I know that all cannot win prizes; but when I hear of so much money taken and so little money distributed, I cannot wonder at the dissatisfaction arising. I think Mr. Gladstone was perfectly right when he said, "Exhibitions must be self-supporting." Now, sir, what would you think of ourselves raising a guarantee fund of our own? Suppose we had an exhibition on a middle scale; say we collect £300 as a guarantee fund, and divide the money we take at the doors among the members. By collecting a shilling per week for three years I think we should raise £2,200, with which we might raise a museum of our own. Now, Mr. Editor, if you can in any way help me by your judgment, I should feel truly grateful for the same.—I beg to remain, yours most obediently,

Peckham, March 5th, 1866. A Working Man.

[We certainly can see no reason why the Co-operative system should not be applied in the manner proposed, supposing circumstances to be favourable. But an industrial exhibition depends for its success upon several matters which call for serious consideration.]

A PAINFUL COMPLAINT.

To the Editor of the Working Man.

Sir,—In your impression of this week the Rev. H. Solly refers to the Leeds Working Men's Institute, mentioning it as an instance of the good that is done, and the money that is spent by Mr. Darnton Lupton. In my opinion too much praise cannot be given to Mr. Lupton. It so happens that I spend most of my dinner hours there, and have spent a little time at similar institutions in London and other places, but have not met with one where the advantages are so numerous and excellent for the money charged for membership (one penny per week). There is only one thing in connection with it that I regret, and it grieves me much every time I enter the reading-room, and that is a placard offering a reward of £5 for information that will lead to the conviction of persons who have stolen books from the library. Many a time, before the above notice was posted, have I felt a pang at seeing a long list of books removed, with a courteous request that the same might be returned by the parties who had taken them away. I don't think that we working men, as a class, and in proportion to our numbers, are any more dishonest than the classes above us. But is it not deplorable, sir, that, after gentlemen have devoted their time and money to the object of making the scant leisure of working men both profitable and agreeable, it should be found there are some amongst us who are so vile and mean? I am told that the fraudulent abstraction of books, newspapers, magazines, &c., is a growing evil at working men's clubs and institutes, or I should not have written to you on the subject; but, not having seen it noticed before, I am anxious it should be made known with a view that, if possible, a remedy may be provided. I remember one day sitting in the Leeds Institute when the hall-keeper came to search for the *Leeds Times*; it was gone, and he said the same had been the case several weeks in succession. I would suggest that no person should be admitted as a member of a club or institute who could not produce a reference or character on being required to do so by the hall-keeper. It is no use blinking the matter, the practice of indiscriminate admission is only offering almost unlimited facilities for petty larceny, and will end by some one being sent to gaol, which will be ten thousand times worse than if a working man's club or institute had never been opened.—I am, dear Sir, yours truly,

Leeds, March 9th, 1866. C. W.

THE CAMDEN TOWN WORKING MEN'S COLLEGE AND INSTITUTE.

Sir,—I am much obliged to your correspondent for his analysis of the committee of this capital society, showing eighteen out of twenty-four to be *bonâ fide* working men, which is a highly satisfactory result. But my remarks did not apply to the committee. I was referring to the *members of the club itself* when I used the word "represented." An analysis of their occupations would be both very interesting and useful. I should be truly thankful to be able to state, on statistical authority, that at all events at present there is no ground for the apprehension I had been led to entertain; and, considering the position the club holds in general esteem, and the extent to which, therefore, it is quoted and offered as an example, the time would be well spent in making the requisite inquiries, if any friend could kindly spare it for the purpose.—Yours faithfully,

Henry Solly.

TO CORRESPONDENTS.

A Young Cabinet Maker.—The information you require cannot be communicated by description. You must obtain practical instruction. As for the books, your best plan would be to consult the Art Library at South Kensington.

Rayner.—You had better study Dr. Arnott's "Elements of Natural Philosophy."

James Coleman.—Messrs. D'Almaine, of Soho Square, published a descriptive pamphlet on the construction of the harmonium.

John Bennett can obtain the brass reeds for concertinas, &c., of the manufacturers. It is impossible for an amateur to make them without all the requisite mechanical appliances.

X. Y. Z.—Letters cannot possibly be replied to in the number immediately following their receipt.

W. D.—Bees-wax is the best thing for filling up the grain of the wood. It may be mixed with a little turpentine, or poured on in a melted state and rubbed smooth while soft, and afterwards when hard.

W. B. L.—You are mistaken. The book was published complete in 1846. Hannett's Treatise was published in 1843, and is better suited to your purpose.

T. M.—The "Report of the Social Science Association upon Trades' Unions and Strikes," and the articles upon "Co-operative Associations in Lancashire and Yorkshire," contained in the "Companion to the British Almanac" for 1862, will furnish the information required by you.

Isle of Wight.—We really cannot show our correspondent the way to teach before he has himself learned. He had better study hard for himself, and master the rudiments of music. Attendance at a class taught on Hullah's system, if it be practicable, would facilitate his advance.

P. C.—A young man in good health, industrious, and acquainted with agricultural pursuits, ought to do well in the western States of America, or Western Canada. But he must be prepared to work hard and to fare hard at first, cheered by the prospect of ultimate success. See "Cassell's Hand-book for Emigrants."

Money Prizes.—There are ten prizes of £5 each and ten of £3 each offered by Messrs. Cassell, Petter, and Galpin, to be competed for by working men, their wives, sisters, or daughters. Full particulars are given in No. 10 of the Working Man.

H. H.—Dissolve 2 lb. of silver in 6 lb. of nitric acid, and evaporate by the heat of a spirit-lamp until the nitrate of silver becomes fused, then dissolve it in 25 lb. of water. On the other hand, dissolve 2 lb. of cyanide of potassium in 10 lb. of water. This solution, added a little at a time to the silver solution, throws down a precipitate of cyanide of silver; this precipitate is washed in pure water and dissolved in 2 lb. of cyanide of potassium; then add sufficient water to make up 100 lb.

THE LONDON CENTRAL

Painters' Hall Company,

LIMITED.

Incorporated under "The Companies' Act, 1862," whereby the Liability of each Shareholder is limited to the amount of his Shares; and no Shareholder will be allowed to take more than Ten Shares.

CAPITAL, £2,000, IN 2,000 SHARES OF £1 EACH,

WITH POWER OF INCREASE.

Deposit on Application, 2s. 6d. per Share, and 2s. 6d. on Allotment. No Call will exceed 2s. 6d. per Share, or be made at less intervals than One Month.

Solicitor.

Secretary (pro tem.).

WILLIAM HENRY TOFTS.

Temporary Office.

29, UPPER JOHN STREET, FITZROY SQUARE.

OFFICE HOURS: 7 to 9 P.M.; Saturdays, 3 to 5 P.M.

This Company is established for the purpose of Leasing or Building a Painters' Trades Hall, Library, and Reading Room, for the use of Trade, Benefit, and other Societies.

PROSPECTUS.

Seeing the great evil of having our meetings at public houses, and the necessity of improving our condition, both morally and socially—conscious of the difficulties and failures that have attended all former efforts in this direction—we have taken a broader basis as the foundation of our work, and a fixed determination that no effort shall be wanting on our part to ensure its success.

To remove the existing evils of public house meetings, the London Central Painters' Society members have formed a Company, on the principle of limited liability, for the purpose of leasing or building a hall in a central part of London, such building to consist of a hall capable of holding 1,000 persons seated, library, and reading room, with large rooms for the use of various societies to hold their meetings in, with committee and refreshment rooms attached, lavatories, &c.

The calls are made easy, to enable working men to take up shares. All are invited to co-operate in the scheme; and, to prevent monopoly, no shareholder will be allowed more than ten shares.

The promoters of the Company are, on allotment, to receive the money outlaid for the promotion of the Company, and no further remuneration until 10 per cent. has been divided amongst the shareholders; any profit over and above this rate to be divided amongst the shareholders and promoters, in proportion of two-thirds to the shareholders and one-third to the promoters.

For the many benefits it will confer upon them, it behoves the working classes generally to devote their entire energy to its advancement, and take every opportunity of making it known and appreciated; as we advance in years, numbers, and intelligence, great and numerous will be the advantages which those who come after us may acquire through our earlier exertions.

The promoters, in bringing this scheme before the working classes, feel the greatest confidence that, if supported by those it is intended to benefit, it will prove one of the greatest advancements of the age, both morally, socially, and financially, and will ultimately produce a large dividend to the shareholders.

FORM OF APPLICATION FOR SHARES.

To be retained by the Bankers of the Company.

No.

To the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED.

GENTLEMEN,—I have paid to your credit at your Bankers the sum of £ , being a deposit of 2s. 6d. per share on shares in the above Company in respect of such shares, or in respect of any less number you may allot me, and I agree to pay the further sum of 2s. 6d. on allotment thereof, and the instalments according to the terms of the Prospectus.

ABRIDGED PROSPECTUS.

How to provide healthy and comfortable dwellings for the population of London is the most momentous and the most pressing social problem of our time. From the natural growth of population, new dwelling-house accommodation will, during the next ten years, be required for 600,000 people. During last year alone, according to the statement of the Earl of Shaftesbury, 3,500 houses were so destroyed, dispossessing 20,000 people of their homes. Bills for authorising metropolitan improvement now await the judgment of the Legislature, which will, if passed into law, involve the demolition of 16,000 houses and the dispossession of their homes of not less than 100,000 people.

The condition of very much of the existing house property (chiefly that occupied by the labouring class) within the metropolitan district properly so called, is so bad, that our sanitary commissioners are seeking authority from the Legislature for the condemnation and destruction of thousands of houses which are nothing better than haunts of misery, nests of pestilence, and fountains of wide-spreading demoralisation.

Here, then, are accumulative evils to remedy, and accumulative necessities to supply. The remedy for those evils, and the supply of those necessities, will be found in the provision, on the most extensive scale and at the most rapid rate possible, of suitable dwelling-house accommodation for all classes of the community.

To take advantage of a field of enterprise thus vast, and to minister to requirements thus urgent, are the general objects for which the Suburban Village and General Dwellings Company (Limited) has been established.

It is now recognised alike by the philanthropist and the statesman that dwellings for even the lower ranks of working men can only be secured in conformity with the established conditions of commercial enterprise. Experience has happily demonstrated that those conditions are perfectly practicable. The middle classes, however, are not less interested in the objects of this company than are working men themselves.

The company, in carrying out the objects contemplated, propose to undertake the following among other special forms of business:—

1. The purchase of estates within reasonable distance of, and having direct railway connection with, London, on which, according to their extent and character, complete suburban villages may be raised, laid out on picturesque plans, with regard to harmonious design, and with due consideration to the means and requirements of various orders of people.

2. The purchase of plots of ground, whether within or beyond the bounds of "London Proper," on which blocks of buildings may, with due attention to sanitary laws, be erected either as homes for households, or as lodging-houses for single men and women.

3. The presentation of opportunities to all classes alike of becoming the purchasers of their own dwellings, by various scales of payment (which have been very carefully prepared) extending, in the form of rent, over a greater or less number of years at the option of the tenant.

The operations of the company are not of a hazardous character. A good substantial dividend, therefore, is within the range of legitimate expectation. Several land and building societies already in existence pay dividends ranging from 12 to 15 per cent. per annum.

As the social exigencies alluded to in this prospectus operate in a greater or less degree in all the large towns of England, the company will be prepared, as favourable opportunities present themselves, to extend its operations to other great centres of industry and population.

Applications for prospectuses and shares may be made to the solicitor, secretary, and bankers of the company.

An estate of upwards of ten acres, situate within three minutes' walk of the Honor Oak Station of the London, Chatham, and Dover Railway, has been secured by the Directors as the site of their first village, on which operations will be commenced with all possible promptitude. [1

Government of South Australia

The Planet Permanent Building AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [30

THE

WORKING MAN:

A Weekly Record of Social and Industrial Progress.

ALL RIGHTS OF TRANSLATION AND RE-PRODUCTION ARE RESERVED.] [REGISTERED FOR TRANSMISSION ABROAD.

VOL. I.—No. 13.] SATURDAY, MARCH 31, 1866. {PRICE 2D. STAMPED, 3D.

George M. Murphy.

THERE are few working men who have not heard of the "New Cut"—that squalid-looking, transpontine thoroughfare, where poor but honest Industry has to roughly elbow it with brazen-faced Vice and crouching Misery; where the "penny gaff" flourishes in all its infamous glory, and where the shouts of rival hucksters, the noisy cries of juvenile "Arabs," and the ceaseless conversation of street-idlers, commingle in a deafening Babel of sounds, suggestive of anything but harmony. A stroll through the New Cut, or the labyrinth of courts and lanes which diverge from it, is certainly not calculated to impress a foreigner with any very favourable notions of the social character of our poorer classes, or of the state of things which permits—nay, almost compels—thousands of our hard-working men and women, whose only crime is that of poverty, to dwell in a neighbourhood where the demoralising tendencies are so numerous, and where the elevating influences are so few.

Yet even in this miserable locality—this fever-nest of social and physical wretchedness—the earnest and persevering spirit of self-help, so characteristic of the modern working man, is busily at work. There is observable a growing tendency among the more thoughtful and intelligent of these people residing in this district to help themselves in effecting their emancipation from the social ills which surround them, rather than wait for the tardy assistance of others. The chief pioneer in this remarkable and encouraging movement was George M. Murphy, whose influence over the working classes of the south of London appears to be almost unbounded. Originally a working man himself, thoroughly acquainted with working-class life, its habits, deficiencies, and aspirations, he has for several years past been one of the recognised leaders of the vast industrial population inhabiting the extensive neighbourhood to which his exertions, as chief agent of the "Southwark Mission for the Elevation of the Working Classes," have principally been restricted.

GEORGE M. MURPHY

The details of his life are extremely simple. Born in 1823, at Chelsea, of respectable and industrious parents, his earlier years glided away unmarked by any incident demanding special notice. In 1839, seized with a desire to become a soldier, he, to the surprise of his friends, suddenly enlisted in the 51st Regiment, where he remained (serving chiefly in Ireland) until the death of his father, when his widowed mother purchased his discharge. During his stay in the army, Mr. Murphy served as drill instructor, non-commissioned officer, and on the recruiting staff. After two or three years spent with his friends in London, during which time his marriage took place, he received from Sir George Grey, then Home Secretary of State, an appointment as officer on board the York convict ship, lying in Portsmouth harbour, off Gosport. Here he remained until the opening of the new convict prison at Portsmouth, in 1852, when both officers and men were removed to that establishment. While at Gosport, Mr. Murphy became a convert to those temperance doctrines which he has since persistently advocated with such earnestness and fervour. A few months later, he left the convict service, and accepted an engagement as clerk in the establishment of Messrs. Fox and Henderson, at Birmingham. Here his leisure time was devoted to the spread of those broad and enlightened principles, the practice of which has conduced so largely to the improvement of the social condition of our artisan population. In 1856, the Rev. Newman Hall, desirous of assisting the working men of South London in their efforts to raise themselves in the social scale, conferred with the leading members of his congregation at Surrey Chapel, the result being the formation of the "Southwark Mission for the Elevation of the Working Classes." But a suitable agent was required. The committee, however, had not long to wait. George M. Murphy came forward, offered his services, was accepted, and ultimately proved to be the right man in the right place.

He went to work in a way characteristic of his future career. He knew that preaching without *practice* went for very little with the masses. They were influenced more by *deeds* than *words*. He sought to gain their confidence. To effect this, he interested himself in their movements, championed everything conducive to the promotion of their best interests, and fearlessly stood up in advocacy of their social and political claims. It was not long before the working men of South London began to recognise their new leader. They gradually gathered around him, and by their support encouraged him to persevere in the good work so auspiciously commenced by him; but it was still a heavy, up-hill task. He had many counteracting influences to contend with, and among these were the pernicious attractions of the public-house. However, nothing daunted, Mr. Murphy, with the kind assistance of Mr. Samuel Morley, was enabled to open the Lambeth Baths, a large building situated in the New Cut, where, during the last three or four years, meetings, lectures, classes, newspaper readings, and musical entertainments, attended by thousands of persons, have been regularly held during the winter months.

There, also, it was that, chiefly through the exertions of Mr. Murphy and his coadjutors, the two South London Working Classes' Exhibitions were held. Acting under the sanction of the Southwark Mission for the Elevation of the Working Classes, he drew up a code of rules, and forwarded these to some 200 persons who were known to sympathise with the poor. The circulars were well responded to, and suggestions were offered. Subsequently the rules were submitted for discussion to three public meetings of working men, and by them were unanimously agreed upon and passed. At the first exhibition 160 exhibitors displayed their articles, although not a shilling had been spent in advertisements; so that this was, as nearly as possible, a spontaneous collection. The exhibition was open for eleven evenings, and upwards of 30,000 paying persons visited it, the receipts leaving a large balance to credit. The second exhibition, held some months later, was still more successful. It remained open during forty-four days, and, although some forty of these were wet, the visitors numbered more than 124,000. The highest number of visitors in any one day was 5,076, the lowest 1,055. The pecuniary result was most gratifying. The late Lord Palmerston distributed nearly £300 as prizes from the profits of the undertaking.

The success of these exhibitions was in no small degree attributable to the efficient guidance of Mr. Murphy, whose services were warmly recognised by the various speakers at the closing ceremony of the later exhibition, presided over by the Earl of Shaftesbury, when the loud and ringing plaudits of the assembled crowd afforded a proof, if any were really required, of the high estimation in which Mr. Murphy is held by those to the furtherance of whose interests he has so zealously devoted himself. We can never have too many of such men. In their upward struggles with the many difficulties which surround them, and drag them downwards, our working men often require leaders on whose good sense and calm judgment they can safely rely; not mere spouters, who delight in setting class against class, but men who, like George M. Murphy, are not above teaching the principles of self-reliance, and showing how those invariably succeed the best who learn to help themselves. If Mr. Murphy had done nothing more than this, he still would have effected enough to secure the friendship and esteem of every right-thinking working man in the kingdom. As it is, we feel a pride and a pleasure in including him among our Men of the People.

*The Materials of Co-operation.**

The beginners and promoters of a Co-operative Society cannot, or do not, always succeed in collecting the right compeers. That is because they do not know what kind of men to look for. They never give it a thought, and no one suggests it to them. We may, therefore, do some service by calling attention to this question at the right time—when the mere formative steps are being taken. Among the first members invited to join a society there is always a choice. Anyhow, something is gained by knowing what kind of persons to look for. Those who know this will make a better selection than those who do not know it. It may not be possible to find many persons answering to the description we have given, but if a few are found, they will serve to leaven the whole, and a far better society will, in all probability, be formed than would result if personal fitness had never been thought of. These who know what a number of attempts at Co-operation in the metropolis have come to nothing, or next to nothing, will be disposed to think the remarks here made and the advice here given justifiable, and, possibly, useful.

When a sufficient number of members are enrolled—say, fifty, or a hundred, according to the neighbourhood of the proposed store and capital intended to be raised—and the capital is in hand, the next step is to select a house, or rooms, for the store. A clean, light place, or a place that can be made clean, should be chosen. Even the approaches to it should be clean. There may be dirty, muddling shopkeepers, but dirty Co-operators have never yet been heard of, and, let us hope, never will. A show shop is not necessary. Plain premises, in any accessible street, will do. What is called a "good shop in a good situation" will be dear, and the general public will not support it. Young Co-operators cannot compete with established and practised shopkeepers, either in a judicious selection of goods, or in quickness and address in serving. The young Co-operators have everything to learn at first, and little to lose. They should, therefore, take up a modest, safe, and economical position. As soon as they know who their members are to be, any shrewd manager can tell what they will want to buy, and how much weekly they are likely to spend; and they will take premises according to their expected business, and buy in stock according to their expected custom. If they go into the grocery business, or the meat trade, or tailoring, or shoemaking, or in the drapery way, their best plan is to get a good-natured, intelligent, experienced grocer, or butcher, or tailor, or cordwainer, or draper, to put them in the right way of buying in, and selling, and preserving stock. Such friendly persons are always to be found, if looked for. At first, wholesale dealers generally were shy of Co-operators, and would not sell to them, and the societies bought at a disadvantage in consequence. Before long, discerning and friendly dealers arose, who treated with them on fair and friendly terms. Mr. Woodin, of London, the tea merchant, and Messrs. Constable and Henderson, wholesale sugar dealers—who, however, only execute large orders—Mr. Hayes, of Dublin, and Messrs. Ward and Co., of Leeds, butter merchants, are examples of tradesmen of the kind we have described. In Lancashire, a wholesale agency has been devised by Mr. A. Greenwood, of Rochdale. The chief office of this agency is in Manchester. This Co-operative Agency keeps buyers in, who understand what to buy, and where to buy it. The want of this knowledge is always a weak point in young stores. By writing to this wholesale Co-operative Agency, both valuable information and services can be obtained, and possibly stores which would enable a young society to offer at once to its customers goods of the best and purest quality, so that the poorest residents in Shoreditch or Bethnal Green could buy food as pure and rich as though they were purchasers at Fortnum and Mason's, in Piccadilly—in fact, obtain West End provisions at East End prices. This is what Co-operation can give them, and nothing save Co-operation can do this for them.

With the information herein and heretofore given, the promoters of a store know how to provide for a start, how to make the start, and how to go on when they have made it. Nothing remains but to appoint good officers, and, when appointed, to trust them. Take security for their honesty by requiring them to hold shares in the society equal to the amount of money passing through or remaining a given period in their hands. Such persons never rob the store, where they happen to be dishonest, because they would be simply running away with their own money held as security. Dishonesty among Co-operators is very rare, and it is sufficiently provided against by the simple method explained. When servants are appointed, they should never be distrusted on rumour, or conjecture, or hearsay, or suspicion. Nothing but the clearly ascertained fact of wrong-doing should be acted upon as against them. If every society took as much trouble to find out whether it has good servants as it does to find out whether it has bad ones, many societies would flourish that now fail. As Mr. J. S. Mill, M.P., said to the London Co-operators, whom he addressed three years ago at the Whittington Club, "Next to the misfortune to a society of having bad servants, is to have good servants and not to know it." Talleyrand used to say to his agents, "Beware of zeal," which leads men into indiscretions. But if earnestness without zeal can be got, so that members shall go about propagating Co-operation among all the neighbours, inhabitants, and families about a store, success is certain. A true Co-operator has three qualities—good sense, good temper, and good will. Most people have one or the other quality, but a true Co-operator has all three: "good sense," to dispose him to make the most of his means; "good temper," to enable him to associate with others; "good will," to incline him to serve others, and be at trouble to serve them, and to go on serving them, whether they are grateful or not in return, caring only to know that he does good, and finding it a sufficient reward to see that others are benefited through his unsolicited, unthanked, unrequited exertions. Gratitude will come one day; but, if it never comes, high satisfaction and a good conscience will always come.

*The Herring Fisheries.**

The present article will treat of the preservation of fish for consumption, both foreign and national; of the parties employed, their various avocations; a comparison of the present importation with that of past years, and of the importation of materials which are required for the proper maintenance of the fishing. We shall also adduce statistical details for the elucidation of the present status of the fisheries.

Besides the great number of fishermen that are employed, there are as many more engaged on shore. Fish-curers are the parties who are the purchasers of fish, and who export them when duly cured to foreign parts, or send them to different parts of our own kingdom. Coopers make casks or barrels, superintend the curing and its apparatus generally, while there are great numbers of women employed in cleaning the fish, so as to make them suitable for consumption. But the cooper is the principal official who is engaged in curing. He serves four years of an apprenticeship, getting about £30 as wages for that period of time. Their wages when they become journeymen, during the portions of the year in which they are not engaged in curing, will be from 12s. to 18s. per week; while they get nearly double these sums when the fishing is current, because their work is then very fatiguing and laborious. But these workmen suffer equally with the hardy fishermen in years when the fishing proves a failure. Nearly all the fishermen served first as coopers, and no curer can properly carry on a fishing business without having served as a cooper.

Twelve days generally are required to make the fish fit for preservation. There is, however, an officer of fisheries, who examines the herrings to ascertain if they are properly cured, and if he finds them to be satisfactory, according to his judgment, he puts, with a red-hot iron, bearing his own initials, the crown brand upon each barrel, which is a sufficient guarantee that they may be used for food, and are in a sound, marketable condition. But, ere he brands at all, he causes the coopers to open barrels *here and there* among those intended for the brand, some at the head, others at the bottom, to satisfy himself that the first are properly cured. This official also ascertains if the casks are of the proper size, and if each one is able to contain 235 lb. of fish, in conformity with law. This system of inspection is undoubtedly one of the best that could have been devised for the regulation and management of the fisheries. The crown brand attests that the article is worth its value, and the mere stamp on the barrel is a sufficient guarantee to the purchaser that he gets value for his money. Foreign dealers are of the unanimous opinion that the brand prevents all disputes about quantity, quality, &c., and that it is a kind of protection to all dealers engaged in the purchase of herrings. Only a few thousand barrels were exported before the appointment of this official in 1815, and now there are between three and four hundred thousand barrels exported. The cost of the Fishery Board amounts to about £12,000, and the Government contemplate the discontinuance of this grant. But, if this should be done, it would certainly cripple the value of the fishery, and create many disputes and disturbances, which its continuance would undoubtedly tend to avoid. We may here observe that the cooper has a chance of getting a respectable situation as a fishery officer, on passing an elementary examination in scholastic attainments, as all officers of fisheries must have been for some time coopers.

The magistrates of the great towns of Germany were and are in the custom of appointing local inspectors to superintend the imported fish. But this practice was abandoned, so far as it affected Scotland, as the crown brand effectuated the object for which they were appointed. This is not the case, however, with Norway, where every curer is allowed to cure his own fish any way he pleases, and the consequence is that the fish must be scrutinised by inspectors. This occasions great delays, and gives a preference to the branded herrings in getting a more speedy sale.

There are a great number of men employed in importing various articles for the preservation of fish. In the year ending 31st December, 1864, there was a British tonnage of 5,913 tons, employing 455 seamen, and a foreign tonnage of 6,631 tons, employing 536 seamen, engaged in importing staves and hoops for the fish-casks; along with a British tonnage of 26,077 tons, manned by 1,865 men, in the importation of salt for the fisheries. There is also a tonnage of 25,189 tons in Scotland and the Isle of Man, manned by 1,965 men, engaged in conveying herrings and cod along the coasts of the United Kingdom. It will thus be observed that even the number of seamen engaged in the importation trade in connection with the fisheries is very considerable, and that they derive their natural sustenance directly from the great deep.

There was a British tonnage of 36,667 tons, employing 2,682 men, and a foreign of 5,355 tons, employing 383 men, engaged in the exportation of herrings and cod, during the year ending 31st December, 1864. Making a grand total of 93,856 of British, and 12,070 of foreign tonnage.

During the year 1864, there were 643,650½ barrels cured; the number branded being 217,392 barrels, and 364,507 exported. The returns for

Continued from page 179.

* Continued from page 164.

the cod and ling department show that there were 107,758 cwt. cured (dried), and about 8,000 in pickle. There were about 17,805 barrels exported to Russia, 168,588 to Prussia, 18,297 to Hamburg, 70,267 to Hanover, 2,130 to Bremen, 25,247½ to Holland, 831½ to Belgium, 125 to France, and 3,989 to other continental parts, making a total of 307,282 barrels.

There were 35,848 barrels exported in the year ending 5th April, 1810, 181,654 in 1830, 252,522 in 1840, 340,256 for year ending 5th January, 1850, and 377,970½ for year ending 31st December, 1860. These statistics will exhibit the exportation of herrings at different stages of time since the commencement of the present century.

From the brief sketch already given it will appear that the fisheries are of great national importance in affording the means of existence to many thousand sons of toil, being labour of a most dangerous and rugged character, and, at times, very trying both to the physical and mental faculties. And we trust that these few observations will have a tendency in increasing the interest taken in the welfare of one kind of workmen to that of another, in estimating the conditions of all classes of the community.

*Employers and Employed.**

We have explained the law relating to the general contract or engagement entered into between employer and employed, and their mutual liabilities during the period of service. We have now to give an outline of its chief provisions respecting

III.—THE PAYMENT OF WAGES.

The mere fact of service is not in itself sufficient to prove the right to pecuniary payment. The law will always presume that *remuneration* is to be given to the servant, but it does not follow that that remuneration is to take the form of money. In the case, for instance, of domestic service, board, lodging, &c., may be the fitting equivalent for the service rendered. In a trade or business, the opportunity of learning the trade, or becoming proficient in it, may also form sufficient consideration. It is therefore necessary in all cases that there should be a distinct understanding, either written or verbal, as to the sum to be paid as wages.

The time at which wages become due depends, in the first instance, on the nature of the contract—that is, whether it be a weekly, monthly, or yearly hiring. As a rule, the payment will follow the period of the engagement, and no wages can be claimed until that period has expired. But this may be otherwise regulated by agreement between the parties; and, in certain cases, general custom will be sufficient to establish the intervals at which payment is due. Thus, in a trade where wages are always paid by the week, a person who might be hired to work at that trade for a particular term—say, two or three months, or until a certain contract was finished—would nevertheless be entitled to his wages week by week, in the absence of understanding to the contrary.

Whatever may be the legal duration of the service, whether weekly or for any longer term, the servant who leaves it without just cause before the full term has expired can claim no wages for any portion of it. On the other hand, if the servant be discharged without such cause before the proper end of the term, he can recover wages for the entire period; but if he be rightfully dismissed before the term has expired, he is not entitled to wages for the time he may actually have served. The causes which are held to justify a master in thus dismissing his servant will be explained in the next paper.

The subject of additional or extra work is one that frequently gives rise to disputes, where the employment is not of the nature of piecework. But the servant is not held to be entitled to additional wages on the ground of additional labour imposed on him, unless there has been an agreement on the subject. He cannot be required to perform any *other kind* of work than that for which he has contracted; but he may fairly be requested to do an unusual quantity of his own work when unusual circumstances require it, or even to perform an increased quantity as his master's business may increase; and, where there has been no agreement, it is at the master's option to give him extra remuneration. At the same time, the master has no right to tax his servant beyond his proper strength; and should he clearly attempt to do so, the latter would be justified in refusing compliance with the request; then, while holding himself in readiness to perform his proper duties, he would not be debarred from obtaining his ordinary rights by the refusal.

It is expressly enacted that the wages of persons employed in all kinds of manufactures and mines shall be paid in the current coin of the realm; and that the master shall not be allowed to plead a set-off against any part of the claim, on account of goods supplied to the servant from a store of any kind, in which the master may have interest. Formerly great abuses prevailed in the manufacturing districts, through the power of masters to pay their servants, either wholly or in part, by tickets for a certain quantity of provisions, &c., to be obtained at particular shops. To remedy these evils, an Act of Parliament was passed in 1831, declaring all such payments illegal. This act is called the Truck Act, it being intended to prevent the system of exchange or barter, which was known by the name of "truck." Under its provisions, if any master should pay his servant according to the truck system, even where an agreement had been made to do so, the payment would be void, and the servant might still sue the master for his wages. The master, on the other hand, would be unable to recover from the servant the value of the goods so supplied. The provisions of this act do not extend to the cases of domestic servants, or persons engaged in husbandry.

The Truck Act is not intended to prevent deduction from the wages of a workman on account of medicines or medical attendance, or of victuals dressed under the master's roof and there consumed, or of rent for the occupation of any tenement, or materials and tools supplied for use in the employment. But in all these cases the stoppage must not exceed the true value of the articles; and it is distinctly stated in the act that the master is not entitled to make any deduction "unless the agreement or contract for such stoppage or deduction shall be in writing, and signed by such artificer."

As to recovery of wages where payment has been refused, the servant's proper remedy is by action in the County Court, which has jurisdiction in cases where the sum does not exceed £50; but the defendant can, if he please, remove the case for hearing from the county court to the superior court, when the sum in dispute is over £20.

The Statute of Limitations prevents the recovery of wages by a servant after the lapse of six years; and in any case where a servant has left the situation for some time before bringing his action, the presumption of the law will be that the wages were paid—that is to say, the master will not in the first instance be put to the burden of proving the payment, but it will rest with the servant to show sufficient reason for not having brought his action before.

The bankruptcy of a master is not in itself sufficient to release the servant from his contract. On the contrary, the liabilities of each party towards the other may continue, unless the service is terminated by mutual consent or stoppage of the business. Where wages are due to clerks and servants at the time of the bankruptcy, the court may order them to be paid a sum not exceeding three months' wages, or more than £30. If a larger sum is due, the servant must prove his claim with the other creditors for the surplus, and take his share of the estate with them. If a certain term of the contract remains unexpired at the date of the bankruptcy, the court may order such a sum to be paid to the servant who is thrown out of his employment, as may seem to meet the justice of the case. Workmen by the job or piece are not included within the provisions of this act.

On the death of a master, the wages due to a servant may be recovered from the legal representatives or executors. In case of the servant's death, his personal representatives are entitled to receive the wages due for the time he may have served. But when there has been a contract for a certain period, or certain services which were uncompleted at the time of the servant's decease, no claim to wages will be allowed for the uncompleted term of service. Thus, nothing could be recovered, as a matter of legal right, by the representatives of a servant who had contracted for an entire year at wages payable yearly, but had died before the year's expiration. This is, of course, provided that no clause to meet such an eventuality had been inserted in the original contract.

We shall treat of the law as to Dismissal and Character in a concluding paper.

* Continued from page 163.

Tips and Tissues.

There he goes, directly the dinner-bell is rung, with his apron tucked up round him, and as quickly as if he were walking for a wager. He is not thinking of his dinner, that is very evident, but of something which he thinks of far greater importance: indeed, I am not sure he has any dinner to think about; and I am tolerably certain there is an empty cupboard at home, though he earns good wages. His money does not go in dress, for his wife and little ones are shabby enough in all conscience; nor yet exactly in drink, though he might do without the one or two unnecessary drops and glasses of ale he takes during the week. No, Jack Thompson is not a drunkard; but he is nearly, if not quite, as bad. He is smitten with the fatal mania which attacks so many, which makes almost as sure a road to poverty, degradation, and moral degeneracy as drunkenness itself. Horse-racing—the petty miserable spirit of gambling which makes him believe in tips, and hunger and thirst after "tissues"—is the bane of his life. And there he goes to see the telegrams stuck up at the sporting newspaper office, and find out which horse is at five to one for the Liverpool Steeple Chase or the Great Northamptonshire Stakes, whether any have been scratched, and how many have arrived. He never saw a race in his life, and he does not care to see one. The excitement, which is almost natural and irrepressible, arising from the contest of several beautiful and highly-trained animals, leaping with big bounds over the course, the varied colours of the riders flashing in the sun, now blending like a parti-coloured ribbon, and then changing with fitful velocity into light patches of brilliant colours—is not the excitement to his taste. He could not feel it. He is as dull to the poetry of motion as to any other sort of poetry. There is no beauty in his mind, and he knows nothing about beauty anywhere else. What he is excited about is the chance of getting a few shillings in a miserable manner by "besting" somebody else (I have heard the phrase), instead of earning them by straightforward work. His is a mean, low nature, and he finds plenty of other mean, low natures to associate with. So he and those like him hang about newspaper office windows, and copy the tissues and collect together in narrow lanes and courts, and shuffle about on the "Ruins," till the police clear them away, and buy little pamphlets, called "Racing Indicators," or something of that sort, and "put one another up to good things," and try to cheat, or "best," each other, though they know there is very little to be got by it. Just as, in Fielding's novel, Jonathan Wild could not keep his hand out of a card-sharper's pocket, though he knew there was nothing in it; and the sharper could not help cheating at cards, though he was well aware Jonathan would not pay if he lost.

Jack Thompson, and those like him, would scarcely know a racehorse if they saw one—certainly know nothing about his good points. The fiery eye, the muscular haunches, the supple limbs, the clean pasterns, which make the thoroughbred so beautiful that better men than Jack feel sorry so noble an animal should be the mere tool of turf speculators and swindlers, are as indifferent to him, except for what they are worth in the money market he dabbles in, as the drooping head, the staggering limbs and the wall-eye of the most wretched street hack. But he believes in what some penny prophet learned in horseflesh says, contradicted, however, by half a dozen rivals, each as learned and each as knowing in all sorts of dodges; he believes in "private information," and he believes in "tips" given in the tap-rooms of dirty little public-houses, where, of course, no betting-lists are kept, as that would peril the licence, but where two or three book-makers are generally to be found, who are kind enough to take anybody's half-crowns, or even shillings, on account of the next "event."

Great is the faith of Jack Thompson and Jack

Thompson's companions. We who never bet are, of course, not to be compared with him for shrewdness and general wide-awakedness. Not we. He is "up to all the moves," and we are "flats." He knows all about the trainers, and the jocks, and the owners, and the book-makers, and betting, and hedging. He bets and hedges, and keeps a book himself in a small way, and stands a good many "drops" while talking about it. He has friends waiting for him; and directly they meet they pull out their little printed books, and crumpled scraps of paper, on which mysterious things are written. They whisper continually, and talk aloud about "going *there*," and seeing "that party." Altogether, anybody would have to get up very early in the morning to steal a march upon Jack Thompson. If he could afford it, and they would suit his work, he would wear trousers very tight in the legs, and a breast-pin with a horseshoe at the end. It is very well he cannot manage those articles of personal adornment, for he would then be so tremendously clever and knowing, that all the rest of us would be extinguished.

But Jack has faith. He believes that everything about the horse he happens to back, or whose name he has drawn out of a hat in a "sweep," is perfectly "square." The owner will not bet against him; the jock will play no tricks with him; he is, out and out, the best horse in the field, and, therefore, sure to win. Lay borrowed half-crowns upon him; "put the pot on" him—the wife's new gown—the children's boots—their dinner, even, on him. He is sure to win. Briaræus, in the *Penny Lamp-post*, has put his name in capitals; the *Lamp-post's* rival, "Swivel-eye," of the *Weekly Tipster*, mentions him respectfully. He has been sent out as a safe thing by "Judicator," of Manchester, and a dozen other gentlemen of large experience on the turf, who execute commissions, and know of good things, and send prophecies in exchange for postage stamps, and whose "tissues" are so many pearls of price!

But the race comes off, and Jack knows the result. He had scarcely any breakfast worth speaking about, but found a penny for his sporting paper, and contrived to steal out unobserved in the course of the morning to have a peep at the betting, and has been shuffling about all dinner time, popping into the little publics, and helping to block up the pavement of a main thoroughfare, and making himself generally a nuisance to other people. And now he knows the result. His "pick" was nowhere, and an outsider at forty to one was landed in front by two necks. Of course, the owner was "square;" Jack said so—and Jack is so very wide awake—up to all the moves, bless you!—and the jock was square; and the horse was all right, and yet—he was nowhere! And Jack has spent nearly a week's wages on him, and has got into debt, and neglected his home, and drank mere than was good for him, and now sneaks home, where there is no fire and no supper, and curses his luck, with a few additional curses for his wife and children, who are such fools that they know nothing about horses.

Never mind, he says to-morrow. There is a good thing that he knows of for the Two Thousand, or the Derby, or the Midlandshire Plate. One of the prophets, who calls himself "Bill Buggins's Bulldog," and has information direct from the stables, is strong upon a certain three-year old, and Jack Thompson is sure to be right over that.

I have seen a little book called "How to Win on the Turf," containing rules by following which it is impossible to lose. But how can A win, unless B, or C, or D, or somebody else, loses? That is just what I cannot make out. But some people do always win; they are professional bettors, and their victims are poor, conceited, lazy "loafing" fellows, like Jack Thompson, who would rather win a shilling in a semi-swindling sort of way than earn five, and who are far more certain to make a quick race towards miserable, dishonest poverty, than any horse they bet upon is to come in first at the post.

Just scan the disreputable-looking crowd who hang about at the corners of certain streets, waiting for the winners to be announced. There are the lazy working man; the fast clerk, who will some day be tempted to borrow without leave; the shopman, who scans his master's till with a longing eye; the lad who dreams that to be "fast" is to be manly; and the professional bettor, half book-maker, half skittle-sharp, whole rogue, who cares nothing where the money comes from, so that his book shows "all right" when the race is over.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

TRUE AND FALSE TASTE IN ORNAMENTAL DESIGN.

Among our art-workmen there is not unfrequently observable a lamentable neglect of the true principles of decorative design. It is forgotten by them that, in attempting to combine beauty with utility, the former should be kept subservient to the latter. As it is, we sometimes find utility sacrificed to mere ornament, thus rendering the article little better than useless. The ancient art-workers were too wise to thus commit themselves. They endeavoured, and with no small measure of success, to render an article—say a vase, tripod, or pitcher—ornamental, without altering its distinctive character. They could not descend into mere imitation. In modern times it is different: instead of attempting to appropriately ornament the articles, we seek to make it appear what it is not. Thus, a rug is converted into a picture, a bracket is made a flower or a hand, and so forth. An instance of this is given in our illustration. Here the chandelier is made to resemble a mass of flowering plants, the leaves being formed of metal and the flowers of glass. On comparing the meretricious effect thus obtained with that which might have been produced had the designer kept to the first principles of his art, we perceive at once the importance of true taste in design. A *real* artist would have endeavoured to develop, as far as possible, the beautiful results arising from the union of refined form with the grace natural to large suspended masses of light, as shown in many of the more expensive kind of chandeliers. In the design given by us, the full effects of the suspended mass of light is lost—first, by being thrown upwards, instead of downwards, from the lamps; second, by becoming obscured among the opaque forms of the metal foliage. A simple stem, slightly ornamented, with branches fitted with glass globes, would have been far more effective, and less repulsive to the lover of true art. But we might go much further, and say, that had a tithe of the labour and expense incurred in making the chandelier appear what it was not, been devoted to simply ornamenting the article in an appropriate manner, the designer might have produced an effective work of art. The lesson is obvious. Never sacrifice utility or appropriateness to mère prettiness or caprice, but always allow the object decorated to retain its distinctive character.

Sharing Profits.

It is rather interesting to note how slowly ideas obtain practical development. The lonely thinker, seated amongst his books, puts into words a thought which is destined to have great influence amongst his kind, and yet he may die before even a few men perceive the significance of his words. Free trade had to wait for Cobden, and yet all that Cobden and the League fought for had been taught long before. It has been just the same with other truths of economic and of the other sciences. Mankind, in the lump, is like inert matter—it takes much to move it at first, but less to keep it in motion after a start has been made.

We have every desire to help, as much as we can, all the plans which tend to the material, the moral, and the intellectual development of our working classes, and hence it is that we watch with peculiar interest the spread—gradual, but sure—of the great principle of association. It is an old principle. Like all other principles, it has been often abused, but we think the time is coming when it will be more widely and rightly appreciated. It would already have had greater support, if masters and men were more in the habit of reading or thinking on economic problems. If Mr. Mill's "Political Economy" were as well known as it ought to be, there would be less absurdity talked about the science than may now be heard anywhere, the House of Commons not excepted.

We may do some good by calling attention persistently to facts which indicate the growth of knowledge. In No. 10 of our Journal we alluded to some results of the associative principle. We have new something more to say on the same subject.

It is well known that for a long time it has been the practice, in certain classes of warehouses in Manchester and elsewhere, to give heads of departments a direct interest in the profits. Merchants give to salesmen a per-centage of profits in addition to salary, and thus induce their servants to labour more diligently. It is important to consider whether the same plan could not be practised, with results equally beneficial, with servants of a lower grade. We gave some instances in which this has been attempted. So far the success has been great. We have been favoured with another and less known adaptation of the principle. Mr. David Morris, F.A.S., of Manchester, and who is well known throughout the cotton districts, not only as mill adviser, but as a gentleman watchful of the best interests of working men, gives us the following statement. Put as a supposition, it may also be taken as a statement of fact. So

soon as the masters and the operatives get quite over the evils produced by the great crisis through which they have passed, we hope to see the bounty system described by Mr. Morris tried in many places.

Mr. Morris states his case himself, as follows:—"Suppose a spinner is paid 1s. per hank, and his production is 24 hanks per week of 60 working hours, then his wages will be 24s. per week. If, by the stimulus of an offered bounty, he can be induced to produce 26 hanks per week, his wages may be advanced *by himself* to 29s. Thus—

	s.	d.
For each hank 1s.	26	0
Bounty for first hank over 24 .	1	0
Ditto for second hank over 24 .	2	0
Total	29	0

While, if through increased smartness and industry he can now and then produce 27 hanks, his wages would amount to 34s., as he would then receive 27s. for the 27 hanks, and 7s. bounty for the three extra hanks—viz., 1s. for the first, 2s. for the second, and 4s. for the third.

"Take, as an illustration of the general principle, a cotton-spinning mill where 24 hanks per spindle each week is required to meet all expenses and leave a fair profit to the mill-owner. The fixed expenses—rent, taxes, insurance, interest on capital, depreciation for wear and tear, carriage, and a portion of the general wages—being the same, whether 24 hanks or any below or above that number be produced, it follows that the loss or profit on the concern will be affected by the quantity produced by each spinner in each week. Thus, if 24 hanks will give, as cost of production (excluding loss of cotton in working), 2d. per lb., then it is fair to assume that 22 hanks will raise the cost to (say) $2\frac{1}{4}$d. per lb., while the production of 26 hanks will decrease its cost to $1\frac{3}{4}$d. per lb. In the case of the 22 hanks production, a loss of profit equal to one farthing on (say) a weekly production of 20,000 lb., will be more than £1,000 per annum, while 26 hanks will, in like proportion, give an increased profit of the same sum annually. Taking the standard of production, then, at 24 hanks per week, while an increase of two hanks will give the worker an increase of £12 10s. per annum as bounty, the employer will receive £104 3s. 4d. as increased profit; and, supposing him to employ 10 spinners, whilst he pays £125 per annum in bounties, he will receive in increased profit £1,041 13s. 4d., thus leaving him a net gainer of £916 13s. 4d. as the result of the stimulus of bounties."

Mr. Morris could tell us of mills in which this plan has been adopted, and in which it was successful. It will be seen that, as a matter of mere pecuniary interest, this scheme is one which is well worth the consideration of masters.

On the Construction of Harmoniums.

The harmonium bids fair to become as popular a musical instrument as the pianoforte, over which it possesses some advantages—such as *superiority of expression*—which renders it peculiarly adapted to accompany the human voice—and, especially, *cheapness*. An harmonium possessing a compass of four octaves may be purchased, in a neat oak wood case, for £5. For this moderate sum we obtain a miniature organ—the "expression organ," as it is called by French manufacturers—of great sweetness of tone, as well as power, in which both melody and harmony—the song and the accompaniment—are capable of being combined.

The great portability of the harmonium is truly surprising, when we consider the volume of sound emitted by it. This is due to the principle of construction consisting in the employment of the "free reed," made to vibrate by a current of air. A primitive form of the free reed exists in the toy known as the Jew's-harp; and it has passed through various grades of improvement in the accordion, aërophone, concertina, eoline, harmonica, melodion, organo-violin, seraphine, &c.

The sounds emitted by this instrument are produced by causing a tongue of elastic metal to vibrate—the free reed; the agent of vibration being a current of air, driven with greater or less velocity through a brass block, having a brass tongue fitting an opening in the same, as in Fig. 1. The reed itself, or the small tongue of brass, is *a*, and this is set in a block, *b*, called the reed-block. It is merely the vibration of this

Fig. 1.

Fig. 2.

reed that makes the sound, and the quality of the sound, or tone, depends, among other things, on the velocity of the vibration. Thus, the tone C is produced when the number of vibrations is exactly 512 in a second. In doing this, the reed rises nearly $\frac{3}{16}$ of an inch, and, consequently, travels in one minute 450 feet, or nearly as far as the piston of a large steam-engine.

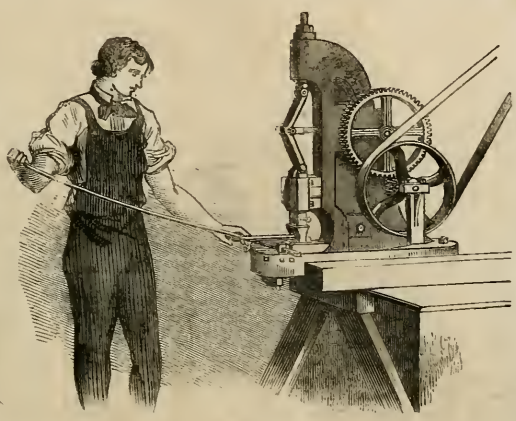

Fig. 3.

The note which the reed must represent upon the key-board depends not only on its length and breadth, but also on its elasticity—that is, upon its weight. A short tongue, thick at the base, vibrates with difficulty, making very restrained and repeated oscillations, and, in consequence, emits a very sharp sound, or high note. A long tongue, heavy at its extermity, thinner towards its base, is easily made to vibrate, but it

Fig. 4.

gives sonorous undulations, long and slow, constituting what is termed the *bass*. If a strict proportion be observed in a keyboard of five octaves, the reeds on the extreme left will have an inconvenient length relatively to the other proportions of the instrument. This inconvenience is remedied by adding to the free extremity of the reed a small quadrilateral prism of lead, which, by its weight, is equivalent to lengthening the reed.

It is in the elaboration of this little reed-block and reed that the greatest ingenuity has been exercised. The raw material of the reed is simply a strip of sheet brass, a full tenth of an inch thick, some two or three inches wide, and several feet in length. The workman takes this strip, in convenient lengths for handling, and puts it under the die of a press, as shown in Fig. 3. This die cuts out one blank, which is simply a flat bar of brass. The bar then goes to a machine, which planes the edges and one face. From this machine it passes to another, which cuts the slot in the block. These processes proceed very rapidly.

The slot in the reed-block is made by a small circular cutter, also in a machine. Every mechanic knows that, in cutting through a thin plate of metal with a circular cutter, a thin fur or jagged edge is left at the ends where the cutter enters and stops. To remove this edge by an ordinary file is no great task, if one has plenty of time; but, in order to produce musical instruments at a very low price, they must be made quickly, and, therefore, elaborating a small orifice like the one mentioned is too costly. A New York manufacturer of melodions, Mr. Carhart, has invented a peculiar file for this purpose, which is so economising and efficient, that the greatest benefit has been received by the inventor from its employment in his work.

The reed—or, as the uninitiated would call it, the tongue—is also peculiar. In former times it was punched out. Experience has proved, however, that punched reeds are not durable. The metal is so much condensed about the base of the reed (where the square shoulder is), that the cohesion of the particles is destroyed, the metal is rendered brittle, and the reed breaks at the place designated. The improved practice is to saw them out by means of a series of delicate cutters set in a wheel. This process takes more time than punching, but a much better piece of work is produced.

When the reed is sawed out it is riveted on to a block by another machine, which, although insignificant in appearance, has worked a complete revolution in this branch of harmonium construction. The appearance of the rivet-head may be seen by reference to Fig. 1. It will be observed that there are two raised heads, *d*, with crossed lines. These heads are portions of metal pushed up out of the reed-block, as at *e*, Fig. 2. There is no pin or solid rivet in the reed or its block; and the saving of time in punching holes, cutting off the pins, putting them in, and closing them—as practised in the old method—is apparent at once to the professional reader.

After the reed is in its place in the block it is planed on its top. The thickness of the reed is less at the base than at the free end, and the tone of the reed is determined by this planing. So accurately does this planing-machine work, that the reed, when delivered finished from the machine, is within a sixteenth of a true note, and requires only a little adjustment to make it perfect. When we add that the tuner, in giving the reed its proper pitch before it is finally placed in the instrument, uses a smooth file, and that *one turn* of this file is sufficient to alter its tone materially, it will be seen that the machine must be very nicely adjusted to make the reeds correct, or nearly so, at first. We cannot dwell longer upon the reed, interesting as it is. The tube-board, or that detail of the instrument which receives the reed-block, demands attention. Viewed as the product of machinery, it is marvellous.

THE REED-BOARD.

This is simply a strip of plank, the length of the key-board, full of little cells as shown in Fig. 4. In each of these cells there dwells one of the reeds we have seen made, and under the bottom of the cell there is a valve placed, covered with soft kid leather. Now, as the performer works the bellows by his feet, he produces a vacuum therein; so, when his nimble fingers press the ivory keys before him, the valve alluded to opens, and the air rushing down upon the reed below, makes it vibrate most rapidly. So many blasts of the bellows, so many keys pressed upon such and such times, will produce some of the most exalted and refined emotions in the human breast that the soul is capable of experiencing.

The cells, or tubes, as the makers call them, where the reeds are set, are all made by a most ingenious machine, which is automatic; and the

strip of plank out of which the reed-board is made, having been placed in a certain position, the cutter goes on and produces all the cells, as at A, and performs its office with a regularity and exactitude which is almost human. This machine will rank with Blanchard's automatic lathe; for it is not only capable of executing work in straight lines, but also carves scrolls for lyres and similar work, with such nicety and rapidity that no hand-work can approach it. The cutters revolve with great velocity, 7,700 times a minute, and the speed of the driving-belt is just one mile in a minute.

There is another little detail in this reed-board worthy attention, and this is the small groove in which the reed-block is set. This groove is about a tenth of an inch wide and deep, and is made by a swiftly-revolving cutter. Each groove is an exact fac-simile of the other, and those made years ago will fit any reed-block made to-day. One of these tube-blocks is cut out in five minutes, and the rapidity with which the details are executed is worthy of notice.

Benefit Societies in Ireland.

As is the case too frequently in England, the benefit societies in Ireland are, as a rule, small, isolated organisations. Often the society is composed of from thirty to sixty members, although there may be three or four of these meeting in the same street. In the numerous tontine societies of this class which exist in Dublin, the members are admitted at all ages up to fifty years, on payment of 2s. 6d. entrance fee each, with the same weekly contributions for all. Any one acquainted with vital statistics will see at a glance that this principle is unsound. How long would an assurance company continue in existence which practised such a system? But the evil does not end here. The general rule of all these societies is to divide the *whole* of their funds each Christmas. The result of this course is that, for all practical purposes, they are bankrupts on New Year's Day. 'Tis true the registrar of friendly societies in Ireland, Mr. Griffen, now refuses to register any society having a rule to so divide its funds. What has been the result of this very proper action on his part? Simply that the societies either decline to register altogether, or, having registered, they divide the funds notwithstanding.

Another great evil in connection with these societies is, that they usually combine a loan society with the sick benefit society, and lend, on personal security, the funds got in for sick insurance. This creates a habit of dependence, not independence, amongst the members: they learn to borrow money, not to save it.

To complete the evils of these small societies, they invariably meet at public-houses, and, while paying, say, sixpence a week to the funds of the society, they spend shillings for "the good of the house." The loans are mis-spent in drink, and the "Christmas divide" is generally largely divided with the publican. If it were even used to provide comforts for the families of the members at the festive season, it would matter less; but not unfrequently the publican receives the nine-tenths of it, and the working man's family lose even the savings in the sick club for the year.

The New Year finds many of these societies formed anew. The old society is broken up, and a new one formed on its ruins; and from this latter the old men, who might now expect "benefit" from its funds, are cast out, and can find refuge nowhere else in their old age. In this respect these societies are a plain and open swindle. The money was taken week after week from these aged members, until they became feeble, and then the organisation was broken up, and the old men excluded from the new society formed by the younger members.

Every means, too, are taken to dispute claims, and reduce the amount payable at death. As a rule, the allowance at death is "£4 from the chest," and a "levy" of 1s. per member, which may produce £4 more. The members have not yet come to see that this "levy" is a mere system of "sending round the hat," or of begging "according to the society's rules." A well-managed benefit society ought not to raise money by such means, any more than an assurance company would presume to do so, and yet try to exist.

There are also in Ireland, especially in Dublin, branches of ill-managed Irish-English societies. As an example, we have, perhaps, thousands of working men in Dublin who pay weekly to the agents of the St. Patrick's Society, with its head quarters in Liverpool, lately under the care of Mr. Tracey, whose name has been rather notoriously prominent in the public press, in connection with legal proceedings taken to try and put gross mismanagement of the St. Patrick Society right, if possible. There is also a branch of another Liverpool society in Dublin. Its "head office" is in a bedroom in a certain street here, and the head agent is an illiterate woman. Thousands are also members of this society; and while it is rather better managed than the other, yet it is far from what a good, well-regulated benefit society ought to be.

In Dublin, Belfast, Cork, and a few other places, we have branches of the Odd Fellows, Foresters, and Rechabites. These societies are established on a better basis than the local tontine societies; they do not take all ages in at the same entrance fee; they do not lend their funds as loan societies; they do not divide their funds at Christmas; and their "lodges," "courts," and "tents" do not break up and re-form their "lodges," &c., at New Year's Day, excluding the older members. The Odd Fellows have almost all got their "lodges" clear of the public-houses; the Foresters, however, cling to these places most tenaciously, and could not be induced to meet elsewhere; while the Rechabites, as their name implies, enforce total abstinence as *the* test of membership.

A peculiar feature of nearly all our benefit societies in Dublin is, that the wives and families of married members, and the mothers and sisters of single members, receive medical attendance and medicine, as well as the members themselves; but this often leads to manifold bickerings and complaints between societies and the over-worked and ill-paid medical attendant.

Now, how are the evils of these societies to be remedied? We think the first thing necessary to be taught in Ireland on this subject, is simply that a well-regulated benefit society is not intended merely to make provision for sickness from Christmas till Christmas. Here is the great point to be aimed at in educating our people on this question. It is a natural failing of the Irish character to be satisfied with the provision of the hour or the day. As an illustration of this, if an Irishman is asked to join a building society, and told he may be able to secure his own house in twelve or fourteen years, he invariably replies, "Where will we all be in half the time?" To get at the root of the evils connected with the tontine societies of Dublin, we must instruct the people that these societies, if properly conducted, ought to provide for future years—not for this year only.

The spread of information on social questions of this class is greatly needed throughout Ireland. Just as the people of Ireland are brought to combine together in benefit societies, building societies, co-operative stores, and similar organisations, so will they in like proportion cease to combine in Fenian or Orange societies, which only injure the members of them, and retard the progress and prosperity of the country. Just in proportion as English working men have ceased foolish combinations, and as Scotchmen have bid adieu to all notions of restoring the descendants of "Royal Charlie," and have united for objects of mutual benefit, so have they prospered; their material interests have been secured, and the wealth of Great Britain, north and south of the Tweed, has rapidly increased.

Let but the same spirit be instilled into the inhabitants of Ireland, and let them be shown that in organisations for mutual self-help lie the great secret of the upraising of the working classes, and the uplifting with them of a nation, and the day of prosperity and of progress shall have then dawned on Ireland.

Improvements in Railway Travelling.—A Liverpool contemporary is informed that the London and North-Western Railway Company purposes making great alterations in the passenger traffic between London and Liverpool. They are now building sets of saloon carriages, in which all the required and desirable comforts will be provided. There will be smoking-rooms, coffee-rooms, &c. The express trains will not stop at any intermediate stations, as water will be taken up at Rugby while the train is in motion. The journey will be performed in four hours.

Mortality in Different Occupations.

I.—MINERS.

To sit down calmly and leisurely to discuss the relative chance which any specific class of one's fellow-men has of enjoying the full term of life, may possibly appear to some very objectionable. And, no doubt, if mere curiosity alone prompted such a speculation, it would be reprehensible in the highest degree. For the life of a man may not be thought of lightly, as one would think of an event dependent solely upon chance; there are grave probabilities involved in the solution of the laws of mortality, and the cessation of the functions of corporeal existence moves the sympathies of the inhabitants of two worlds. But to apply such knowledge as experience yields regarding the certainty with which the infraction of hygienic laws infallibly carries with it the sequence of a shortened life, to the end that we may the better keep those laws, is not only wise and expedient, but good in every way.

Probably there are few in this age who are unaware that the influence of profession, trade, or occupation on the health of individuals, as of masses, is very great, and that such influence varies not only with the nature of the calling, but with many other circumstances. Thus, when we say that a particular trade is unhealthy, we know that it will affect different persons diversely, according to their ages and constitutions, and the locality where the trade is carried on is also a powerful element of variation. This should be borne in mind in all comparisons of the healthfulness of any kinds of occupation, or there will be danger of fallacious deduction.

In the absence of any clearly-defined system of nomenclature, no attempt was made to ascertain the different rates of mortality prevailing in the various occupations with any degree of exactness, or on any comprehensive plan, before the census periods of 1851 and 1861. The Census Commissioners, in 1851, adopted a form of classification (which they subsequently improved on), so as to distinguish, as far as the materials they had to work with would allow, the numbers living who were engaged in all the multifarious branches of industry, manufacture, &c.

The mortuary records of the Registrar-General's department supply the occupations of all who die—so the necessary facts are now in a measure obtainable, although, from the great difficulty in distinguishing many branches of different trades and manufactures, only those which are too well defined to admit of doubt should be used unreservedly. We have, therefore, selected one, about which there can be little mistake as the subject for our consideration in this first essay.

Here is the MINER, the human mole who drives his burrows into the bowels of the earth, revealing the secrets of the gloomy treasure-house, and casting up in rich profusion that vast store of wealth whose possession is the source of England's never-failing power and greatness. But let us turn from the dazzling picture of shining ore, and huge masses sparkling like gems, and look upon the means by which these magnificent results are obtained. Ah! but that is the dark cloud of which we have just seen the silver lining. It is like the warning remnant of mortality which the Egyptians, wise in their generation, kept on their festal boards to remind them of what they might otherwise forget.

High-born gentlemen and delicate ladies, duly equipped in the exterior habiliments of the miners' calling, and surrounded by every possible protection against danger, make a short expedition of pleasure and excitement down the shaft of some show mine; and when their curiosity is satisfied (which usually takes but a short time) they betray considerable anxiety to breathe the open air at the pit's mouth again. There they quaff a bumper to the success of the owner, and depart under the impression that they have acquired some knowledge about mines and life underground.

Very little will such pleasure-seeking explorers have seen of the real perils of the miner's life; those are *arcana*, revealed only by intimate practical acquaintance.

"They that go down to the sea in ships, that do business in great waters; these see the works of the Lord, and his wonders in the deep;" and thus, in paraphrase, it is with the miner. But

instead of being amidst the wild grandeur of the elements, his life is spent in solitude, darkness, and silence; with nought to break the terrible quiet save the constant tapping of his pick, or the dreaded fall of some overhanging mass which, perchance, may seal his doom by setting free the deadly vapour, or, more terrible still, by converting his narrow chamber into his living tomb.

What influence has the miner's occupation upon his health? There are miners and miners, many branches of the same family, and they have, therefore, different degrees of healthfulness.

The following table is derived from the Supplement to the 25th Annual Report of the Registrar-General, and shows the comparative mortality of the great body of miners at different ages, in juxtaposition with the mortality of males of all occupations throughout England for the two years 1860-61:—

Ages.	Deaths Annually to every 1,000 Living.	
	Males of All Occupations.	Miners of All Kinds.
15—25	7·2	8·2
25—35	9·1	10·0
35—45	12·3	13·8
45—55	17·7	29·3
55—65	31·1	43·1
65—75	66·3	109·7
75—85	148·8	216·1

From this table it would appear that at the earlier ages there is no great disparity between the miner's chance of life and that of other men; but when the meridian is passed, the diseases which are most fatal to the class come into operation, and the odds go fearfully against them. This will suffice for a general view of the comparison; but to obtain any striking results it is necessary to go more into details, which we shall do in another article.

*Building Societies.**

The terminating societies, which we now proceed to criticise, are based upon a calculation generally of 5, 7, or 8 per cent., and to terminate as soon as the investing shares have realised, with interest and bonus, a certain amount, which amount is fixed at the commencement of the society. The duration depends, of course, upon the sum fixed upon to be the ultimate value of the shares, the amount of subscription, and the rate of interest upon which the calculation is based. For instance, supposing 5 per cent. to be the rate of interest selected, the subscription 10s. per month, and the ultimate value £120, the duration will be fourteen years. If 7 per cent. be the rate chosen, with the subscription and ultimate value the same, the period will be ten years. The way these societies work is as follows: A borrower gets his future payments of 10s. per month per share, or whatever the subscription per share may be, discounted. But seeing that every year of the society's existence decreases the number of the future payments, the amount to be advanced must decrease in proportion. For example, at the commencement of the society the present value of a £120 share, taking 5 per cent. as the rate of discount, will be £60; at the commencement of the second year, £56 18s. 5d.; the third year, £53 13s. 7d.; the fifth year, £46 13s. 11d.; the eighth year, £34 16s. 7d.; and so on decreasing as the time goes on, and the society draws nearer its end. The reason of this is obvious. The society is to terminate in fourteen years; the first year the member who receives the £60 pays for the full fourteen years; and the payment of 10s. per month for that time is the proper amount for the repayment of £60 and interest, at the rate of 5 per cent. per annum. The second year the society has only thirteen years to run, so that a person borrowing then has one year's less payments to make; he is, therefore, only entitled to receive £56 18s. 5d. And, in like manner, the eighth year there remains only seven years' payments, so that the sum to be advanced is correctly decreased to £34 16s. 7d. It must be remembered, in judging of the usefulness of these societies, that while thus the amount to be advanced per share gets less every year, the repayment remains the same. Hence, if a person wish to borrow £200 at the commencement of the eighth year, he will have to take six shares, which will realise £208 19s. 6d., for which he will have to pay £3 per month, or £36 per annum, an amount quite equitable for the society to require, but which very few borrowers find it convenient to pay. The effect of this is just what any one might predict, from the consideration of the foregoing particulars—plenty of borrowers apply the first year, but very few afterwards. The members who join with the intention of borrowing are soon satisfied, and there is little to induce non-members to come in to borrow, but a great deal to deter them from so doing, in the high rate of the re-payments. Some of these societies actually raise the entrance fee even up to £1 per share to borrowers, although, certainly, as Arthur Scratchley, Esq., significantly says, "without sufficient reason." A large unremunerative capital is the inevitable consequence; the only way to dispose of it being to compel some of the investors to retire, and we find the ballot resorted to when borrowers fail to apply for advances, to determine which of the investing shareholders shall receive the amount of their shares. It would be very desirable, if possible, to know exactly how long a society will last, and to be able to reckon upon receiving a certain sum out in return for a definite number of subscriptions. But although these societies are advertised to last only so many years, experience proves that, while some possibly may have been successful, by far too many take a much longer period to work out than originally calculated. This follows not of necessity from losses, but either from the calculations being erroneous upon which the society was based, or from its being assumed that the funds would find constant employment, by being continually re-advanced to members, whereas we have seen that quite the contrary is most probable. The result is, the society has to be prolonged. The investor does not only not receive the amount he had been led to expect when the time fixed at first for its completion has arrived, but he has actually still to pay in common with all the members, until such time as the funds are sufficient for the purpose. The borrower has to continue his re-payments in like manner, but he has not the poor consolation of knowing that what he has to pay extra will be returned to him. Every payment he has to make after the stated period has expired, is so much added to the cost to him of the advance, and if it continue many months (as we have known more than one society to do), the extra amount a borrower has to pay raises the rate of interest in a very serious degree.

A friend of the writer borrowed £2,000 some years since from a society of this kind, and it lasted two years longer than had been anticipated. The re-payments amounted to over £200 per annum, so that the loan cost him £400 more than he had calculated for. Thus, neither for investors nor borrowers, does this kind of society offer much attraction or profit. The scheme itself is faulty. If the money could always be put out at remunerative interest during the whole existence of the society, then, as in a permanent society, a satisfactory result would be obtained; but the fact of the society having to terminate in a certain fixed period, or thereabouts, makes that, the one thing needful to its success, impossible. The following is the opinion of Arthur Scratchley, Esq., President of the Friendly Societies' Institute, of this particular kind of Building Society:—

> We believe the impartial reader can arrive but at one conclusion. He will become satisfied that not one in twenty, or even a greater number, can possibly realise for its members, whether investing or borrowers, the advantageous results originally promised; and that at the various epochs of their expected termination, there will be found such a deficiency of money as must deprive the possessors of unadvanced shares of a considerable portion of the accumulation which they had been led to expect.

The practice of bidding for the advances which has been introduced into some of these societies, in lieu of a fixed rate of annual interest, does not remove any of these objections, but makes it still worse for the borrower, because the premium agreed to be given is deducted from the advance at the time it is made, so that it is really paying the interest for the whole term down at once. It is pleasing, however, to reflect that societies of this objectionable kind are few and far between, as compared with the Permanent Societies and the Mutual Benefit Societies, which are all free from similar liability to disappointment and failure.

The Mutual Benefit Building Society, with all its advantages and disadvantages, will next engage our consideration.

We have already remarked that Mutual Benefit Building Societies are established upon the reciprocal loan principle: in other words, every member lends the society a certain periodical sum—say 5s. or 10s. per month—upon which he does not expect to get any interest, in order to obtain in his turn the loan of a large amount from the society—it may be £200 or £300—without interest, and repayable by instalments, spread over ten or more years; and the fund appropriated to advances is made up exclusively of the payments of the members, thus differing from the other two kinds of societies, which borrow, sometimes very largely, from their bankers or from some private source. Advances are made as often as the accumulated subscription and repayments are sufficient for that purpose; and as soon as all the shares are advanced or withdrawn, the subscriptions are returned and the society at an end. At first glance, it might be thought that very little profit is likely to accrue from such an arrangement. It might be argued that if the members only receive what they themselves put in, each will of necessity have to lend the society an amount equal to the advance he receives. But although this would hold good against a clothes or coal club, it does not hold good if applied to Building Societies; because a large portion, and in some cases the whole amount, required by the society in repayment of the advance, is drawn by the borrowing member from the property which the advance from the society has put him into possession of. We find that even in the longest societies—the Bowkett Building Societies, which, according to Dr. Bowkett's tables, are calculated to last 31 years, 25 of which the subscriptions are to be continued or an equivalent amount paid, the payment being only £2 per annum for £200—each member only lends the society £50 and receives £200. In the better kind of societies, where the subscriptions are twice as much or even more, about the same amount is paid by each member upon his shares, or it may be a little more, but not much, because the society terminates in so much less time. We can look at it in another way. Supposing a working man is only able to spare the £2 per annum, it will take about forty years for it to accumulate, with interest at the rate of 5 per cent. per annum, to £200, £80 of which will be his own; so that in the course of 40 years he will have made £120 profit by the transaction. But by paying it into a Bowkett Mutual Benefit Building Society, he secures the £200 within 25 years, and in the course of five years more may expect to receive the subscriptions, about £50, he has paid into the society.

THE MARRIAGE OF LABOUR AND SKILL.

'Twas a beautiful temple—the workmanship there
No plummet nor compass had spann'd;
Its dome was illumined with brilliancy rare,
By light from its architect's hand.

Bright jewels were flashing that never, I ween,
Were found in the pearl-diver's store;
And gems glittered there in their lustre serene,
More dazzling than queen ever wore.

An altar, all sacred, was reared in the fane,
A couple in wedlock to bind;
And sons of the morning re-chanted again
Their songs in the temple of mind.

They have bowed at the altar, and now they are wed,
The graces are waiting around;
The prayer and the last benediction are said,
And Labour his helpmate has found.

Their beautiful children are thronging the earth,
From Greenland to Italy's sky:
They have Labour's strong limbs of legitimate birth,
And Skill's searching glance of the eye.

What forms from that union have mantled the sod
Let poets—let history, tell—
Since Labour was sent from the garden of God,
With Skill as a partner to dwell.

M. Ellerd.

The Public Income and Expenditure.—It appears from the latest return presented to Parliament that the gross public income of the United Kingdom of Great Britain and Ireland in the year ended the 31st December last was £69,196,478 7s. 6d. The total ordinary expenditure was £65,948,265 4s. 10d.; showing an excess of income in the year of £3,248,213 2s. 8d. But £560,000 goes towards the expenses of fortifications, which reduces the excess of income to £2,688,213 2s. 8d.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

METROPOLITAN AND PROVINCIAL WORKING CLASSES' INDUSTRIAL EXHIBITION FOR 1866.

To the Editor of the Working Man.

Sir,—In order to give effect to the valuable suggestion of your correspondent, "An Overlooker," which appeared in No. 11, the Council of the Metropolitan and Provincial Working Classes' Exhibition are prepared to offer a Prize Medal for the best working model of an inexpensive *Crust Grinder* which may be sent for exhibition. They are enabled to do this through the liberality of Robert Murray, Esq., F.S.A., Kinnahaird, Dingwall, Ross-shire, who has placed a silver medal at their disposal, for the purpose of encouraging mechanical ingenuity.

I would also respectfully suggest that the readers of the Working Man raise a subscription among their friends, for the purpose of building a Lifeboat, to be called "The Working Man," that it be placed in the forthcoming Exhibition, at the Agricultural Hall, and publicly presented to the National Lifeboat Institution, in the name of the working men of Great Britain. I believe that a penny subscription would be sufficient to accomplish this; and if Messrs. Cassell, Petter, and Galpin would kindly undertake to act as treasurers, the necessary amount might soon be raised.

The particulars of the Exhibition above referred to were advertised in Nos. 1, 4, and 5 of the Working Man.—I am, sir, yours faithfully,

W. J. Watts, *Secretary.*

7, Birchmore Terrace, Cardington Street, Hampstead Road, London, N.W.

[We have much pleasure in giving insertion to the above letter. The proposal contained in the latter part of it is for the consideration of our readers, from whom we shall be happy to receive opinions or suggestions upon the subject. Great success has attended the efforts made on behalf of the National Lifeboat Institution by the readers of another of Messrs. Cassell, Petter, and Galpin's publications; and if the working men wish to carry into practice the suggestion made by Mr. Watts, Messrs. Cassell, Petter, and Galpin will be happy to become the treasurers of such a fund as he proposes in connection with this Journal.—Ed. W. M.]

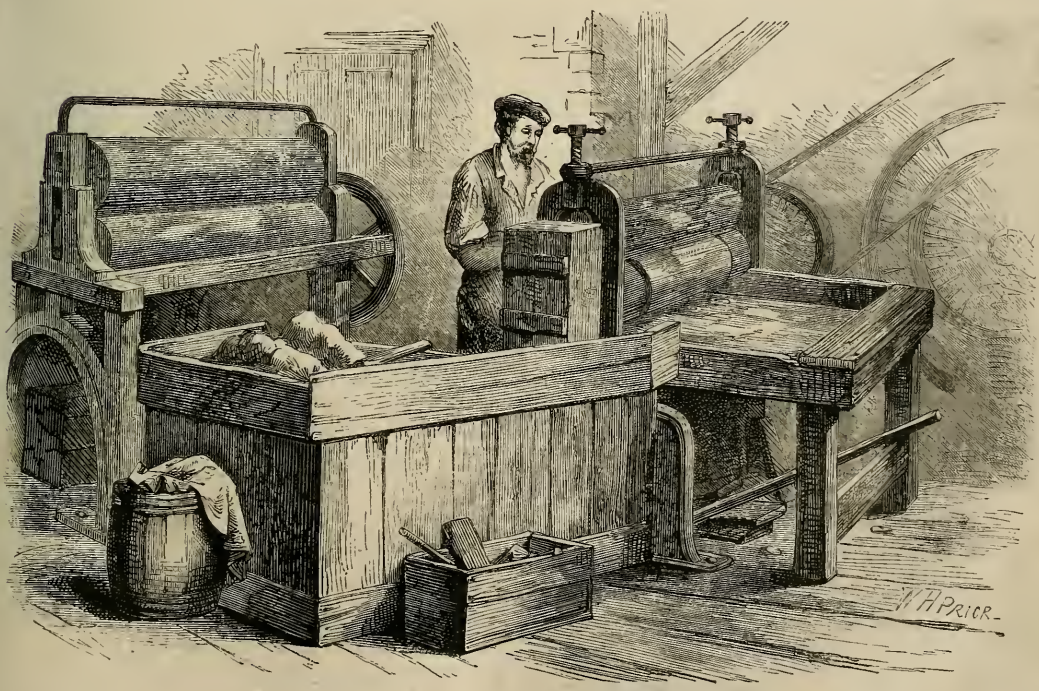
Blue-book Knowledge.

We hear enough of "blue blood," more than enough of "blue stockings," and not enough of blue knowledge. There is a knowledge of this description copiously supplied in Parliamentary blue books. Those who have the courage to read them, know their curious value, and are familiar with their curious treasures. Though seldom referred to, and less read, they are always prepared under a sense of responsibility, and those who furnish the information printed in them have ample means of knowing the truth of what they say, and strong inducements to tell it. They are responsible reporters or compilers; their words become authorities; they may be called to account if they mislead; an official weight attaches to their representations, and these considerations add or ensure accuracy to what they produce.

It is of great value to working-class readers to know that they can trust the accuracy of what they read. A great deal of what passes for knowledge is mere garrulity. The mind of the reader is diluted with mere words, and his real ideas are in danger of being washed away. It is worth while, therefore, to read even blue books, whose ordinarily dry and insipid pages are often luminous with the light of facts. The last six years of Parliamentary history were weekly written in an invaluable work, now unfortunately discontinued, because there were not enough of people to appreciate its worth and support it. It was entitled the *Parliamentary Remembrancer.* It was the practice of the conductor of that work to enrich it by the most curious and ancient sayings of eminent jurists and legislators. But it was his invariable practice never to make a quotation until he had actually seen it in the original. If the remark occurred to the memory, and could not at once be verified, it was deferred, however apt and pertinent as an illustration it might be, until it could be personally verified. Such a writer could always be read with profit, trusted implicitly, and quoted in debate with the certainty of indisputability. We remember on one occasion being present at a Committee of the House of Commons, when the accuracy of the records of the House was in question. The most eminent authorities on Parliamentary procedure were upon the committee. The editor of the *Parliamentary Remembrancer* was under examination. He had asserted that the divisions of the House were frequently and seriously wrong; sometimes fewer members and sometimes more were declared by the Government to have voted than did actually vote. "How do you know this, Mr. Toulmin Smith?" said Mr. Massey, who was then, if we remember rightly, Chairman of Committee in Parliament. "You are aware," explained Mr. Massey, "of our method of taking divisions. Every member gives his name; the clerk marks it off at the moment; every name is added up, transcribed, and printed. Where does error creep in, or how do you find out when it occurs? What means can you have of being more accurate than ourselves? You speak confidently that we are often wrong. Three or four votes wrongly recorded may decide the fate of a Government. We have every motive to be correct, and, if we are wrong, we cannot even guess how you discover it." The answer was this: "You are aware, Mr. Massey, that you print the votes every morning, and state the number of them. Well, I *count* them. In adding up the votes, the voting clerks often err, and thus I discover it."

This is why we wish, as we lately stated, that our consuls and secretaries of embassies and legations could be instructed to furnish particulars of the condition of the working classes in the respective countries in which our official representatives are placed. What are the chief trades of the working classes there — what rates of wages — modes of payment — hours of working — condition of habitations—industrial prospects, and degrees of social and political liberty enjoyed by them? The state of the labour market—emigration and importation of labourers—the health, and nature of clothing of the people, their education, and provident, or other habits, would be of great interest and value to the British labourer. A world of information, unknown and inaccessible—now, indeed, unconjectured—would in the course of a few years be at the service of the people. We have, in the interest of the working classes, put the matter into the hands of a Member of Parliament, and we shall, in due course, be able to give an account of the

MANUFACTURE OF PAPIER-MACHE.—THE STAMPING PRESS. (*See page* 202.)



MANUFACTURE OF PAPIER-MACHE.—THE ROLLING MILL. (*See page* 202.)

result. We pay out of our taxes a considerable amount of money to support representatives of the Crown and commercial interests of Great Britain at foreign courts and in foreign countries, and the result is neither so conspicuous nor so varied or valuable as may be desired. We are sure that the uses of our legations and embassies would be increased, were they to undertake the kind of duty we have indicated.

Industrial Exhibitions are daily increasing. We have had International Exhibitions, but what have they been, compared with what they will be when we know the state and character of industry in every part of the world, and international communication is established amid them? Then we shall have International Exhibitions worthy of the name. This very week there is announced an International Society of Artists, Limited, on the Co-operative principle. Co-operation is to be applied to art. To what may it not be applied? The prospectus, which has an elevation of thought more than English,

observes that "Art knows no frontier." We may add—Industry knows no frontier, but it has hitherto had a very narrow frontier in Great Britain, whether it has "known" it or not; and by the plan we recommend, if the Board of Trade will acquiesce in it, and the Foreign Office will concur, the frontiers of industry will be abolished, and there will be universal knowledge circulating and universal intercourse existing—that indispensable precursor of universal good-will among all the sons of labour.

The Papier-Mache Manufacture.

The manufacture of papier-maché is a department of art industry of comparatively recent introduction into this country, although in France it is known to have existed for more than a century and a half. It was first practised in England during the latter part of the last century, and was used principally in the making of heads for dolls. In Germany it was first practised by one Martin, who followed the occupation of a varnisher. He went to Paris for the purpose of learning the different processes of the manufacture, after which, returning to Germany, he set up an establishment for the making of papier-maché snuff-boxes. These snuff-boxes became so popular that they were generally known as "Martin's." The importation of papier-maché goods from France into Prussia was at one time so extensive that Frederick II. conceived the idea of establishing a manufactory in Berlin. This he carried into effect in 1765, and with such success that several other German states speedily followed the example. The articles originally produced were of an extremely simple character, the processes being of the rudest possible character. As the adaptability of the manufacture to other purposes than the production of snuff-boxes, tea-trays, and similar articles became better understood, fresh branches of the art were commenced, these ultimately becoming of more importance and value than the parent manufacture.

Papier-maché is made in two different ways. The first is by pasting sheets of paper closely together upon models or in moulds. This method is employed principally in the manufacture of tea-trays, tables, snuff-boxes, and other articles intended to undergo the process of japanning. The second is by pressing paper pulp into moulds and subsequently baking them. This latter process is the most important and artistic of the two, and is resorted to for the production of mouldings, fretwork, rosettes, cornices, and other architectural ornaments; also pilasters, capitals, and even figures as large as life. The advantages possessed by articles made of papier-maché, or its kindred substance, carton-pierre, consists in their being lighter, more durable, and less brittle than if made of plaster of Paris; consequently, ornaments made of papier-maché or carton-pierre are in continual demand for the decoration of public buildings, the higher class of mansions, &c., holding a somewhat similar relation to the ornamentation of *interiors* which terra-cotta bears to the ornamentation of *exteriors*.

One of the most extensive papier-maché works in the kingdom is that belonging to Messrs. George Jackson and Sons, Rathbone Place, Oxford Street, London. It consists of an extensive range of workshops and offices, in which about 300 hands are continually employed. The majority of the workmen belong to the highest skilled class, many having been trained in the establishment; and it speaks well for the state of relations subsisting between the heads of the firm and their work-people that not a few of the latter should have been in the establishment almost from their very boyhood.

The papier-maché is prepared by boiling paper slips until they are reduced to a pulp. This pulp is then carried to the rolling-mill, where it is rolled into sheets of a uniform consistency. These sheets are taken to the moulding-room, which presents a busy scene, being crowded with workmen and youths actively engaged in moulding the pulp into the required forms. This is effected by first preparing a "backing" of coarse pulp; on this a piece of brown paper of the requisite size is placed—this, in its turn, being covered with a layer of the finer description of pulp. The mass is then closely pressed together in the metal moulds, by means of a powerful press, the power of which is calculated at from 30 to 40 tons. From the press, the moulds are taken to the oven, where the papier-maché is thoroughly dried, after which it is taken out of the mould, pared, trimmed, touched up, and again placed in the mould and re-dried in the oven. This process is again repeated once or twice, after which the papier-maché ornament is ready for use.

Carton-pierre is made in a manner similar to that of papier-maché, but is produced from coarser materials. It is pressed by the fingers of the workmen into the moulds, which are sometimes of wood, sometimes of metal. Wire and other materials are used for strengthening it where necessary. Unlike articles made in papier-maché, those formed of carton-pierre require only one baking in the oven.

Composition articles are prepared in a somewhat analogous manner. The composition is prepared by kneading together certain proportions of whiting, melted glue, resin, oil, and other ingredients, until the whole forms a soft but tough mass. Should it become too hard for use, it is steamed, by which means it becomes moistened, and more fit to be moulded into shape. The moulding process is not much unlike that adopted in the production of articles in carton-pierre. After being taken out of the moulds, they are sent to be trimmed up and finished.

The number of moulds used is very extensive, and must amount to several thousands, a separate mould being required for each pattern produced. Where the design is one in frequent use, several moulds precisely alike are used. The mould-making is a distinct branch of the manufacture. The design is first drawn on paper, and then modelled in plaster of Paris; a cast is then taken of the model, and by means of this a metal cast is obtained. Where wooden moulds are required, they are cut in accordance with the models furnished.

The artistic skill and talent employed in the production of the designs is of the highest possible order, and it is a matter of some national interest to find that nearly all the art-workmen in the employ of the Messrs. Jackson are of British origin, thus, to some extent, refuting the popular fallacy, that in this country art manufactures cannot be successfully carried on without the assistance of Continental artisans. As before observed, most of the workmen have received their training in the establishment itself. They appear to be a most intelligent and industrious body, and the ease and celerity with which they get, through their labours is indicative of their skill and experience.

In the carpenters' shops, a number of workmen are industriously engaged in preparing wooden frames, panels, and other articles intended to be decorated with ornaments in carton-pierre or papier-maché. In another portion of the building, workmen are preparing backgrounds in plaster of Paris for a similar purpose. Here, too, portions of large ceilings are being manufactured in such a way that they can be easily put together. These ceilings are made of plaster of Paris, strengthened with canvas and, where required, with wood. The lightness of the articles thus made is extraordinary, and explains the secret of their adaptability for ceilings and like purposes.

The papier-maché or carton-pierre designs are affixed by means of glue to the article intended to be ornamented. This is a description of labour requiring considerable care and tact, many of the designs, when complete, being of an extremely elaborate nature. When the article, say a picture-frame, has received the finishing touches, it is allowed to thoroughly dry, after which it is ready for use, and, if intended to be gilded, is taken to the gilding-shops.

In the designers' room the designs are prepared on paper for the use of the modellers, who have rooms to themselves, where they can labour undisturbed in the production of the various beautiful and graceful ornamental decorative designs, which have tended to enrich so many interiors, not only in this country, but in various parts of the world.

A stroll through the show-rooms shows the vast number of purposes to which the use of papier-maché and carton-pierre can be applied. Here are statues, life-size; picture-frames, panels, cornices, brackets, rosettes, pediments, fretwork, mouldings, heraldic shields, articles of furniture, portions of proscenium for theatres and music-halls, pilasters, and an immense number of similar objects, the greater portion of which display an amount of really good design and taste highly encouraging to those who desire to behold the successful development and prosperity of the various branches of art industry in this country. Indeed, the reputation of the Rathbone Place establishment is so widely spread, that orders are continually received from the Continent, one of the most extensive works undertaken by the firm being the production of the whole of the magnificent decorations used in the interior of the Malta Theatre, which is stated to be one of the most splendid in Europe.

PRIZES FOR ART-WORKMANSHIP.

On Wednesday, the 21st instant, the ceremony of distributing the art-workmen prizes of the Architectural Museum, late of South Kensington, took place in the theatre of the Geological Museum, Jermyn Street. Mr. J. B. Beresford Hope, M.P., presided. The body of the meeting consisted almost entirely of those who were evidently of the workman class. The chairman, in opening the proceedings, touched upon the present position of the Architectural Museum with regard to its separation from the Kensington Museum, the removal being caused through the "boilers" coming down; and he informed them an intimation had been given that there will not be room in the proposed new buildings for this collection; and he urged all the friends of architectural art to assist in securing a site for the museum. He dwelt upon the fact that the great purpose of providing architectural art-culture was left in the hands of a few private individuals, and he was of opinion that it was a branch which the Government might well have undertaken. He then proceeded to speak of the relationship of art to the increased comfort of the people, and pointed out that the people, by the exercise of art, had better homes in the way of furniture, and at no greater expense, than they used in times before art-workmanship had so far advanced. He expressed his earnest desire that art-workmen should receive the honour of their skill, and not that the employer should have both the profit and the honour; and he thought that if the names of the workmen were given in meritorious works, it would be an incentive to men to push on. He then described the various works and prizes. The council of the Architectural Museum had offered three prizes for stone carving—the first of £20, the second of £5, and the third of £2, for the most successful carving in stone of a subject from Flaxman's illustrations of Dante, entitled "The Triumph of Christ." There had been six competitors, and the council had given an extra prize, because they considered four of them were worthy of prizes—three in marble and one in white lias stone. The one to which the first prize had been given would be "caviare to the general," for it was a specimen of real low relief, and not of low high relief. It was in marble, and it turned out to be the work of Arthur W. Harris, of Ryde, Isle of Wight, the son of a watchmaker, who, judging from a letter he had written to the council, had the true instincts of art in him, for this was his first attempt. The second was by John Seymour, of Tower Lane, Taunton. In wood-carving no prizes had been given because the conditions had not been observed in the specimens sent in; but to one, a work by Mr. Wormleighton, at Mr. Roddis's, of James Street, Birmingham, a supplementary prize of £10 was awarded for excellence of carving. A prize of £15 had been awarded to Mr. Holliday, a workman in the employ of Hunt and Roskell, for the best head taken from the reduction of M. Brucciani's statue of Germanicus, to be modelled in *repoussé*, or bossed-up silver. The second prize of £5 was given to Mr. Frantzen, of King Street, Clerkenwell. Prizes for translucid enamels, being a reproduction on a flat "plaque" or plate of silver, of the figure of St. Barbara, ascribed to Nino Pisano, were awarded to Frederick Low, of Wilderness Row, and H. de Koningh, of Dean Street, Soho; and the winner of the first prize was also awarded a £10 prize for opaque enamels. A prize of £10 was awarded to George Rooke, of Bywater Street, Chelsea, and prizes for modelling in clay, the subject being "Alfred harping to the Danes," were awarded to R. W. Martin, of John's Terrace, Walworth Road, and J. W. Gould, of Bayham Place, Camden Town. Several interesting speeches were delivered on the advance of art, and the benefits to be derived both by individuals and the country by its culture. A very cordial vote of thanks was passed to the chairman, whose attachment to art was warmly acknowledged by all classes present. The vote was acknowledged, and the proceedings terminated.

Education in the Nailing Districts.—An effort is about to be made to bring the educational clauses of the Factory Act (shortly to be brought before Parliament) to bear upon the nailing districts, if possible. A public meeting was held recently, when the chair was taken by Lord Lyttelton.

A Successful Co-operative Store.

BY A BRIXTON CO-OPERATOR.

The causes of the failure of some of the Co-operative Societies in London have long occupied the attention of the thinking portion of the working classes. That they have failed is unquestionable; but the reasons of their failure is not so clear. There may be certain conditions, essential in a great city, under which Co-operation cannot succeed. Upon this subject, however, I shall express no opinion, hoping to see the question settled authoritatively in those essays for which the conductors of the Working Man have offered such handsome prizes. That the great principle of Co-operation can and does succeed in the suburbs of London, and that in no questionable manner, it is now my purpose to show by the example of the Brixton Co-operative Industrial Provident Society.

This society, which is now in a very flourishing condition, has been in existence about four years, having been established in the spring of 1862. Like the oak, the germs of whose giant branches were once contained in the acorn, it had a very small beginning. Some few working men of Brixton and its neighbourhood having got hold of a copy of that excellent publication, the *Co-operator*, naturally thought that that which had effected so much good for Rochdale could not be of much harm to Brixton. Accordingly, a public meeting to discuss the subject of Co-operation was held, a society was formed, and about 200 persons enrolled themselves as members. Of this number, however, all did not take up shares. On the first night for receiving subscriptions on shares the amount paid in was somewhere about £73. This sum was soon increased to a little over £100; and we then thought ourselves justified in commencing business, considering the amount of our capital ample. Of course we were treated to the usual amount of ill-natured criticism from all those of our class who, being without the will or desire to help themselves, consider those who wish to improve their condition as fair marks for their pot-house wit. The tradesmen of the neighbourhood were not behind-hand in their sarcastic remarks. Some of them kindly offered us £10 for our stock and good-will in trade; while others of them considerately warned us that if we persevered in our mad career we should all be insolvent in a month. It was not without some little misgiving that we commenced business. We had no fear of the result, providing all were in earnest; but we feared the lukewarmness of some, coupled with the open hostility of others, might prove more than a match for us. However, all our fears were soon scattered, for we promptly learned that it was not customers, but capital, that we stood in need of. In a word, we found our small capital of £100, which we had fondly counted sufficient, utterly inadequate for our wants. We could go to market only in a hand-to-mouth manner, and thus were debarred from the advantages which a larger capital would have given us. This state of things soon produced its own remedy, for those who had hitherto held aloof from us—the timid waiters on success—now finding which way the current had set in, came and took up shares, and so placed in our hands increased capital; and such increased capital gave us, of course, increased facilities for business. Our number augmented, indeed, to such an extent that we required more accommodation, and we found it necessary to enlarge the shop that we had taken. From that time to the end of the year all went well with us; and at its close, after about eight months' business, we found that our members had increased to 216, while the amount we had received on capital stood at over £300. We had done business to the extent of £2,124, and our gross profits amounted to £220 and some odd shillings. We had every reason to be satisfied with our first year's venture.

With the following year (1863) came increased prosperity. All were enthusiastic in the work; committee-men gladly gave up their time to promote the interests of the society; our members were banded well together; and the officers of all kinds worked with might and main. When we first started at Brixton we counted amongst our members several who resided at Streatham; these had gradually introduced others, until we considered that we had a sufficient nucleus at Streatham to start a branch store. This we accordingly did, upon a very small scale, in the summer of 1863, and we have since that time had no reason to regret the step we then took. Our business at Brixton had increased, was increasing, and promised yet further to increase to such an extent that our place of business was again proving insufficient for our requirements. We had started a clothing store, and it fared with that as with the provision store. All went prosperously with us, and at the close of the year our numbers footed up 464, having more than doubled in the course of the twelvemonth; while the capital they were possessed of stood at £1,300 odd, showing an increase of more than £1,000 during the year. We had, during the same period, transacted business to the extent of nearly £7,000, yielding a gross profit of about £950.

The year 1864 proved an eventful one in our history, for it had not grown very old ere there occurred an unfortunate division in our ranks. It was patent to all, and had been so for some time, that something must be done for the better accommodation of our ever-increasing business. All were agreed as to that; but all were not so agreed as to the proper means of doing that something. Two courses were advocated; the one, to remove to what was considered by some a more advantageous position, and erect new stores, at a roughly estimated outlay of about £2,000; or, on the other hand, economise our capital, by remaining where we were and enlarging our then existing premises, at a calculated cost of a little over £120. This was the rock upon which we split. Parties were about equally balanced, and, as it was provided by our rules that in any such case a general meeting of the members should decide the disputed point, a general meeting was called, and upon the decision at which the collective wisdom of all our members should arrive depended the settlement of the question. Party feeling ran high; the advocates for the enlargement of the existing premises used all their persuasive powers to induce members to support them upon a division; while the opposite party, who struggled for removal and the erection of new stores, were not behind-hand in their blandishments. The important night of decision arrived, and, after a lengthened debate, in which the arguments pro and con. were ably sustained, "the House" divided, when there appeared that 163 members advocated the enlargement of the then existing premises, while 157 were of opinion that the interests of the society would be best served by removal and the erection of new stores, giving the former a narrow majority of six. Besides the members who voted, there were, however, several who remained neutral. In consequence of this result, about forty members, refusing to be bound by the decision of the majority, seceded, and started a new store in the particular neighbourhood for which they had so strong a predilection, some short distance from the old one. May they prosper as we have done! Notwithstanding this unfortunate split, however, our numbers at the close of the year had increased to 600, and our capital was fast approaching £2,000; while the amount of money received for goods during the year had reached the not insignificant sum of five figures, being represented by no less an amount than £10,425. Of course, with this increased business, our profits increased in a proportionate degree, and we found ourselves credited under this head with a sum of £1,400 odd, out of which amount, after paying our expenses, we devoted £62 to interest on capital, placed £32 to the credit of the reserve fund, and divided nearly £800 as bonus among our members.

During last year we still continued on our prosperous career, and found our enlarged stores, which now consisted of four houses, none too large for us. We also opened a second branch store at North Brixton, and our Streatham branch having outgrown the limited accommodation provided for it, we decided upon erecting new stores in Wells Lane, upon a piece of ground which we took upon liberal terms from the rector on building lease. This store we inaugurated at the beginning of the present year, and it is now in active operation, doing a very remunerative trade. At the close of our last quarter, on the 28th of December last, our numbers had increased to 765, possessing a capital of nearly £3,000, and during the year we had transacted business to the tune of over £13,000, yielding a gross profit of £2,150, out of which sum we paid £91 in interest on capital, added £34 to the reserve fund, and distributed as bonus nearly £1,200. From the commencement of the society to the close of last year it has paid as interest on paid-up shares £186 18s. 11d., and in bonus on members' purchases £2,655 9s. 7d., making a total net profit of £2,842 8s. 6d.

This year, so far as it has at present gone, we have met with more than our usual success. Finding butchers' meat so extravagantly high in price, we determined on applying the principle of Co-operation to that also. Consequently, at the end of January, we started in that line in a small way, for we always begin to crawl before we essay to stand. Since that time the business has steadily progressed, and though we at present labour under many disadvantages, our average receipts now amount to nearly £50 on a Saturday night, and nigh upon £100 for the week; and these amounts are continuously increasing. Within the last few weeks we have opened another branch store, making the third, at Balham, and this promises to rival, if not surpass, its elder branches. The takings at this branch already exceed £50 a week, and this for a small suburb like Balham cannot be considered at all unpromising. Since the close of the last quarter, our numbers have increased from 765 to over 1,000, and the business we are now transacting is at the rate of from £20,000 to £25,000 per annum. There are many other interesting items which I could furnish did space permit—amongst other things, the manufacture upon our premises of boots and shoes, &c.—but I refrain, and I think all will agree that if our society is one of the youngest, it is one of the most active and vigorous, and therefore one of the most successful, of all Co-operative Societies.

In conclusion, I think all will agree that the facts I have stated, and the figures I have given, are conclusive evidence that Co-operation can be made successful in the suburbs; and if successful in those suburbs lying so close to London as Brixton, Streatham, and Balham, why not successful in London itself? Surely it is worth a fair and open trial. We Brixton Co-operators are all agreed that the publication of this simple narrative in such a widely-circulated and influential organ as the Working Man, would have the desired effect of giving an impetus to the cause of Co-operation in London—a cause, the success of which, especially at this time, all working men should have deeply at heart, for Co-operation implies needful combination, and combination gives power; and with such power what might not the working men of this kingdom accomplish for the elevation and happiness of their class, the progress and purity of government, and the advancement and prosperity of their loved native land?

Fire-damp.—Mr. G. F. Ansell exhibited in one of the committee-rooms of the House of Lords, a few days since, an apparatus of very simple construction, whereby a sudden outburst or gradual accumulation of gas in a mine would give almost immediate warning of its presence. The instrument exhibited was formed, in the first place, of a glass flask six inches in height and two in diameter. Its top was tightly covered by a piece of common red tile, and from its bottom went a narrow tube, which, being bent upwards, rose to double the height of the flask itself. Mercury was lying in the bottom of the flask, and, of course, to the same level in the tube also. In the upper part of the narrow tube were the projecting ends of two isolated wires, connected with a small galvanic battery. This forms the whole apparatus, and we may suppose that the flask is placed in a part of the mine where some men are at work, while the wires could be extended to the top of the pit, and there be connected with a battery and bell. If, while the men were working, a small or large quantity of gas were suddenly disturbed, some portion of it would percolate through the tile and gather in the flask with remarkable rapidity. There it would press the common air upon the mercury, and induce it to rise in the narrow tube until it reached the wires. Immediately the mercury touched them the galvanic current would be complete, and the bell would be set ringing. This warning would be given in less than two seconds from the time the gas made its appearance; and another instrument, designed upon the same principle, would give warning of a gradual accumulation of gas when it had become dangerous. Mr. Ansell also shows an instrument a little larger than a watch, and constituted upon the principle of the common barometer, which the mine viewer could take in his hand; and if, in the course of his passage through the mine, he came upon any place where the atmosphere was charged with even one per cent. of gas, the instrument would register it.

Things Talked About.

The evidence given before the election committees shows that—in some places, at least—bribery and corruption flourished at the last general election. It would be most unfair, however, to suppose that the voters belonging to the working classes were exclusively the objects of the attention of the "strangers" and "dark men," who slipped bank notes into the hands of voters only too willing to be corrupted. Tradesmen and men in comfortable middle-class position were, if their own admissions may be believed, quite as ready to take money—in some instances, from both sides at once. We do not believe that the proposed addition of a few hundred thousand working men to the constituencies would materially add to the number of those who are willing to sell their birthright for a miserable mess of pottage. But the *Times* is doubtful on the subject, and half prepared to be afraid of the admission of a few more artisans to the franchise. In a leader, it asks a series of questions, which we have little hesitation in answering in the affirmative. "As the elections were not, on the whole, the work of bribery, intimidation, and other evil influences, however much there may be of these things, it follows that there must be a strong countervailing effect in the good sense and independence of a very large portion of the constituency. But let us suppose that in as many as fifty or even a hundred boroughs the majority be handed over to a lower class. Will it be found as substantial as that above? Will it contain as many men able to have their opinions, and to hold their own in the face of wealthy customers, tyrannical landlords, importunate neighbours, and the dictation of the society, the club, the public-house, or the mill? Is the proposed class strong enough to stand its ground? Let it be ever so educated, let its aspirations be ever so exalted, let it be ever so admirable and interesting in its own sphere, has it stability and self-reliance enough to be depended on as the principal basis of the Constitutional system?"

Sir James Kay-Shuttleworth, who probably understands working men better than the *Times* writer, has little doubt upon the subject, and would answer their questions as readily as ourselves. A few evenings since, he addressed the Kendal Working Men's Club on the subject of "The Electoral Power of Working Men," and took occasion to express his belief "that if the working class possessed the electoral power, it would be exercised beneficially for the removal of every remaining obstacle to a universal provision of elementary education for the children of all persons supported by manual labour, in favour of sanitary reform, and in resisting all the selfish encroachments of capital on public convenience or private rights."

The Wigan Relief Committee has held its last meeting, and has a balance in hand of £82 to dispose of, so nobly was the cry of distress responded to. In the course of 180 weeks, or about three years and a half, the committee dispensed in relief the sum of £78,878, and all within the town and immediate neighbourhood. There is a gratifying paragraph in their report:—"The condition of the factory population is now most satisfactory, the scale of wages being in most departments higher, and in none lower, than it was before the cotton distress. The number of operatives now at work is about 6,000; but there are still several of the large mills standing, which, if they were at work, would employ at least 2,500 hands; and of those that are working, some are doing so with only a short supply. The large mill in the Mesnes will require, when it is in full operation, quite 1,000 hands; so that the prospects of the cotton operatives cannot but be regarded as most favourable." With regard to cotton especially, we hear of magnificent prospects opening to commerce:—"Three years ago the first planting of cotton took place in the Brazilian province of San Paulo without attracting attention. The attempt has succeeded so well as to induce a Liverpool Brazilian Steam Company to extend their trips to Santos, the chief port of that district, with the view of taking in a portion of the quantities now offering as cargo. By next midsummer a line of about eighty miles will penetrate from Santos to the interior of the province of San Paulo, and will not only facilitate the export of the new article, cotton, but will open up one of the finest coffee-growing districts in the empire. In Mexico, the line from the port of Vera Cruz to the capital is in rapid progress; and in the Argentine Republic one line of about eighty miles has just been opened, with results that promise almost immediately to enable the company to dispense with the Government guarantee of 7 per cent., and another of 240 miles is already nearly half completed."

In the Paris Exhibition of 1867, a space of 93,000 square feet is reserved for British exhibitors, and that, we are told, is considerably less than one-third of the accommodation asked for; and yet, it is nearly one-third of the whole available space: so that British enterprise would willingly occupy the entire building! Not quite behind yet in the industrial race of nations.

We have before us a temperate and well-written pamphlet, by "Incognito," on the "Relations between Masters and Men." It advocates the allotment of a portion of property to the men employed in a large concern, over and above the fixed wages, such allotment, however, to depend upon good conduct. The author predicts great results from the adoption of his proposition. But there are two sides to the question, and we admit that we prefer the shareholding on the limited liability system adopted at Messrs. Greening's works at Manchester, recently described by us.

Government has introduced a bill for the preservation of the commons and open spaces within a radius of fifteen miles around London from encroachment. Few of us, perhaps, were prepared to hear that, within that distance of St. Paul's, there are 180 commons, the gross area of which amounts to 10,500 acres, equal to about one-eighteenth of the entire county of Middlesex, and to which the people have a clear right for the purposes of health and enjoyment. But such is the case, though what it might be in a few years, if the continual "nibblings" now indulged in were permitted to go unchecked, no man can say. The Government measure proposes the formation of a Commission, with ample powers to make rates for drainage, keeping in order, and other purposes. Mr. Cowper, the First Commissioner of Public Works, truly said, when introducing the bill, "The maintenance of the commons round London was exceedingly important for the preservation of the health, and for the enjoyment of the people. London was not merely the habitation of Londoners, but of persons devoted to science and art, who came up from the country; and anything which contributed to the health and salubrity of the metropolis was therefore a matter of national interest and importance. In proportion as the great Babel was travelling into the country, these commons and open spaces became more valuable, particularly when railways and building speculations were more and more menacing them with utter extinction."

A pamphlet has just been published by Mr. Augustus Smith, M.P., the "Lord of the Isles," who so gallantly summoned his merry men to throw down, by moonlight, the railings with which Earl Brownlow had enclosed, for his private use, a large portion of Berkhampstead Common, which some of his neighbours, rich and poor (Mr. Augustus Smith among the number), thought was quite as much their property as his. Mr. Smith prints the correspondence which has passed upon the subject, and, to the public at least, satisfactorily justifies the propriety of his summary act. Not only did the earl take possession of a large portion of the common, but, in so doing, blocked up highways, forcing wayfarers to make a circuit of several miles. Mr. Smith justly says:—"So outrageous an infringement of public rights of highway (which, irrespective of the parish convenience, are important for all places within a circuit of ten miles at least), I venture to say, has not been perpetrated by any lord of a manor in the present century, while the attempt to overbear and oust commoners from their rights by the mere local weight and influence of territorial possessions, I will also venture to say, has equally no parallel, coolly dispensing as it does with all those forms and notices which the law has provided for regulating and carrying out such transactions, while all those observances have been equally ignored which usually characterise the conduct of gentlemen in dealing with their neighbours."

The venerable Lord St. Leonards, once plain Edward Sugden, a poor working boy, has introduced into the House of Lords a Bill to establish Councils of Conciliation, for the purpose of ending disputes between masters and operatives. A very large body of working men, we are told, are in favour of the Bill.

We are very glad to see that the Islington Vestry is determined to enforce the provisions of the Act for the Better Local Management of the Metropolis and the Nuisances Removal Act, by compelling owners of small house property to attend to sanitary requirements, and prevent overcrowding. Several such owners have been fined, and the sanitary inspector is still hard at work. Six or seven persons sleeping in one small room, thirty or more in one small house, damp floors, fever, and high death rates, are among the evils the vestry have to do battle with. An inspector has died from fever caught in the performance of his duties.

Co-operative Intelligence.

Easington Lane Amicable Industrial Society (Limited).—The members held their fifth half-yearly meeting, in Mrs. Bewick's school-room, on the 17th inst., Mr. John How, president of the society, in the chair. The committee's report and balance-sheet for the half-year ending March 3rd, which was read by the secretary, Nicholas Lee, and unanimously adopted, showed a very encouraging increase of business. During the half-year, six new members had joined the society, and six had withdrawn. The sales amounted to £895, being £225 in excess of the previous half-year. After payment of working expenses, which, at present, are unavoidably heavy, and other charges, and five per cent. interest on capital, a surplus was left, which enabled the committee to pay members a dividend of 8d. in the pound on their purchases, and leave a balance in. "We hope," writes the secretary, "that against our next half-yearly meeting, we will have to report a large increase of business, and, also, a large accession of members. This society has had many drawbacks since its commencement, as is often the case with Co-operative Societies in their infancy, when experience has to be bought at a costly rate. We trust that this disciplinary process will greatly aid our future development."

General Information.

CLUBS AND INSTITUTES.

The Bedford Institute Working Men's Club, Wheeler Street, Spitalfields.—This club commenced 18th December, 1865, when seventy members were enrolled the first evening, and up to 19th March, 1866, the number of members on the book is close to 450. The committee have been engaged in organising discussion meetings, harmonic gatherings, a singing class, and an elocution class. In all these projects a lively interest is taken by the members, and already a deal of good has been produced. The refreshment-room of the club is open in the morning for the purpose of providing early breakfast, and a considerable number of the working men of the surrounding neighbourhood have availed themselves of the nice, clean, warm, comfortable room placed at their disposal. The attendance has become so large, that the committee have had to increase the ways and means of supplying them. The secretary says:—"As regards our finances, we are (thanks to a few friends who assisted us at starting) placed on a sound footing, and we shall, at our present rate of progress, shortly be in a self-supporting position."

Southwark Working Men's Club and Institute.—On Wednesday last, the members of this club gave a free entertainment to their friends and neighbours, at the Lambeth Baths, which were kindly lent for the occasion by Mr. Murphy. About forty of Messrs. Maudslay's artisans' brass band, with the hearty concurrence of H. Maudslay, Esq., gave their services gratuitously, and very efficiently performed various selections of music. Popular songs and recitations were given by several members of the club. Mr. S. S. Taylor, the president, remarked on the advantages within the reach of working men by greater union, and on the opportunities which clubs gave for united action, when seeking social elevation, self-improvement, or recreation. Mr. Symons urged his brother working men to give their cordial support to the institution, which, being entirely in their own hands, they could manage cheaply—admission, 2d. per week—and temper to their own tastes. Three cheers were given for Mr. Murphy, who came in, and spoke in favour of the Southwark Club. A vote of thanks was carried by acclamation, and the entertainment concluded with "God Save the Queen." The building filled at an early hour, and many were disappointed of admission. On Monday, April 2, there will be another meeting at Surrey Chapel, when the Rev. Newman Hall will preside.

Luton Working Men's Club and Institute.—The first half-yearly meeting of the above club was held, on Monday evening, in the Institute, King Street, John Everitt, Esq., presiding. There was a full attendance of members, and the following report was read by one of the secretaries:—"The committee, in presenting the first report of the Luton Working Men's Club and Institute, have much pleasure in testifying to the success which has attended their exertions since the opening of the club. The society was established with the view of supplying such material as would tend to the improvement and the enjoyment of the working men, to cherish their mutual helpfulness, to surround them with such elevating influences as go forth from similar institutions when well conducted, and to help them to obtain rational amusement and recreation. How far this object has been attained, may be gathered from the following few statistics, made from the opening of the club to January:—Number of weekly payments, 1,460—amounting to £12 3s. 4d.; monthly, 123—amounting to £3 11s. 9d.; quarterly, 185—amounting to £13 17s. 6d.; penny tickets, 538—cash value, £2 10s. 4d. Total, £31 7s. 5d. The total number of tickets sold for admission, to February 2nd (this does not include those persons who have patronised the refreshment department only), is 2,306. In addition to the provision made by the committee, the members themselves have instituted singing, elocution, discussion, and other classes; all of which work successfully, thereby testifying to the interest they take in the well-being of their club. They have, likewise, had a social gathering of themselves and friends, upon which occasion the members catered for the amusement of between 300 and 400 persons with great success. The committee are anxious to establish a library in connection with the club, and make an appeal for assistance in this direction, reminding the members that 'little helps, if rightly given, make the impulse stronger,' and that books are masters who instruct us without anger, and without pay. In conclusion, the committee would urge upon the members the necessity of their constant support and co-operation in promoting the welfare of the club, and extending its usefulness, that, under the blessing of Divine Providence, many may be benefited thereby."

WAGES AND SHORT TIME MOVEMENT.

Amalgamated Tailors' Societies.—As we announced last week, a conference of delegates from the various societies of journeymen tailors has been held at Manchester. It seems that the idea of forming an amalgamated society was originated in Manchester, and very cordially accepted by others. This will be seen from the fact that

delegates attended the conference from the following towns:—London, Liverpool, Leeds, Sheffield, Birmingham, Newcastle-upon-Tyne, Hull, Cheltenham, Leamington, Rugby, Wellsbourne, Sunderland, Derby, Bolton, Bristol, Bradford, Chester, Preston, Warrington, Oldham, Torquay, Wolverhampton, Darlington, Brighton, Wigan, York, Carlisle, Cambridge, Durham, Stockton-on-Tees, Stafford, Exeter, Scarborough, Stockport, Huddersfield, Bury St. Edmunds, Bury (Lancashire), Penrith, Bishop Auckland, Birkenhead, Barnsley, Padiham, Peterborough, Lancaster, Oswestry, Shotley Bridge and district, Rawtenstall, Hartlepool, Blackburn, Northwich, Malvern, Chesterfield, Crewe, Halifax, Chorley, Macclesfield, Kidderminster, Stourbridge, Dudley, Heywood, Runcorn, Dewsbury, Altrincham, Rochdale, Market Harborough, Wakefield. Letters approving of the amalgamation were read from societies in the following towns:—Lurgan, North Shields, Leicester, Blackpool, South Shields, Whitby, Croydon, Harrogate, West Hartlepool, Maidstone, Gloucester, Wrexham, Southampton, Horncastle, Londonderry, St. Helen's, Gainsborough, Maynooth, Bridgewater, Kendal, Barrow-in-Furness, Uxbridge, Glossop, Canterbury, Shrewsbury, Lincoln, Oxford, Bingley, Nottingham, and Truro. At the opening meeting, Mr. Green, of London, presided, and he stated that the conference represented more than 6,000 working tailors, one-third of that number being resident in the metropolis. The conference have met several days. At one of their meetings it was resolved that fifty-seven hours per week, to conclude at two o'clock on Saturdays, was sufficient labour, and that any work done over these hours should be paid for at the rate of "time and a quarter." It was further resolved that one uniform number of hours be paid per garment throughout the amalgamation; that the price per hour be left to each town; and that the executive council take means to procure the drawing up of a general log; "that we do not recognise day-wagemen;" that the subject of apprentices be referred to the consideration of the executive council, with a view to the possibility of developing some system to be suggested to the next conference. In the further sittings it was resolved that the national council should hold its sittings in Manchester, and that the secretary should reside in that town. Mr. J. McHugh was elected president; Mr. Green, of London, vice-president; and Mr. J. Glurrocks, secretary for the first year. It was resolved, "That inasmuch as the general wages of the country are, to a considerable extent, influenced by the rate in London, this conference recommend all delegates to impress upon their constituents to support the London operatives in their endeavour to procure an advance of one penny per hour." Another resolution was, "That the conference be held in London next year." It was further resolved, "That the conference recommend its constituents to give the Leeds operatives all the support possible in their endeavours to advance their list of prices and regulate their hours of labour; that the amalgamation will use its best endeavours to limit as much as possible out-working, and, where that cannot be avoided, will endeavour to procure higher prices to out-workers to counterbalance their extra expenses, to save them the necessity of working longer hours than those who work in shops; that the conference are of opinion that the men ought to get one-half of the work done by the machine." The last resolution, and the most important one, was, "That the conference are of opinion that recourse to the strike should only be an extreme measure, and cordially approve of the present effort to prevent strikes by establishing a council of arbitration." At the final meeting it was resolved, "That the conference recommend to employers the necessity of providing proper workshops, so as to preserve the health of their workmen; and consider that a good workshop should allow 1,000 cubic feet of breathing space to each man; should have side-lights, lime-washed walls, proper ventilation, and should also be provided with proper sanitary convenience and a supply of water, and should in no case be below the level of the ground on any side." The business was concluded by votes of thanks being passed to those gentlemen who had been most energetic in promoting the amalgamation.

Carpenters' and Joiners' Advance of Wages Movement.—A delegate meeting of the joiners of the metropolis has been held at the "Brown Bear" Tavern, Broad Street, Bloomsbury, to consider the propriety of enforcing the memorial for an advance of another ½d. per hour on the present rate of wages, making the payment for skilled workmen 8d. per hour. About 200 delegates were present, representing nearly every large firm in the building trade, and every large job now going on in the metropolis, comprising both society and non-society men; altogether about 5,000 men were represented. The delegate from Jackson and Shaw's firm was called to the chair. The chairman said every delegate present was aware that last year they had asked for an advance of ¾d. per hour on their then rate of wages, 7d. per hour, and that the employers, after a strike had taken place at Messrs. Cubitt's, had offered an advance of ½d. per hour, which was accepted by the men with the understanding that, as the ¾d. was refused, a memorial should be sent in to the employers giving six months' notice for another advance of ½d. per hour on the first Saturday in May next. These memorials were accordingly sent in, and the present meeting had been called to ascertain the opinion of the trade whether the prayer of that memorial should be enforced or not in May next. He was now ready to receive the reports of the delegates. Each delegate then gave in his report, stating the firm or job and the number of men he represented, with the feelings of the men as ascertained by shop meetings held for the purpose. From these reports it appeared that at least nine-tenths of the men were for standing firm, at all hazards, for the ½d. advance in May next, while of those who dissented, nearly all were willing to abide by the decision of the meeting. Officers were appointed, and other steps taken for effecting the object in view.

STRIKES.

Strike of Puddlers.—The puddlers at the Elsecar Iron Works, near Barnsley, have struck work. It appears, from the statement of the union men, that when the iron is in a suitable condition for working they are able to get out six heats each turn; but of late the iron has been so "grey," that they are only able to get five heats each turn. The masters pay 10s. per ton for the same quality for which, it is alleged, the puddlers of Manchester and other places obtain 14s. The masters now offer an advance of 1s. per ton, but the men stick out for 3s.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

MR. CLAY'S EDUCATIONAL FRANCHISE BILL.

To the Editor of the Working Man.

Sir,—I was pleased to see, in a recent issue of the Working Man, that you had consented to be the medium of ascertaining the opinions of the working classes relative to Mr. Clay's Educational Franchise Bill. Well, Mr. Editor, with all due deference to yourself and to Mr. Clay and his supporters, I beg to differ from you on this subject. I cannot conceive how an educational test would take among that class which it is intended for; but for myself and others whom I have had the pleasure of conversing with upon this matter, we should not approve of it, inasmuch as there are no means whereby we or others can arrive at safe and just conclusions upon political questions. And until politics are reduced to a *science*, on the first principles of which all classes of the community may expect to agree and come to right conclusions, we cannot see the propriety of placing the working class under an obligation which the middle and upper classes are not expected to submit to. Any one who can get and pay a £10 or £7 rental can remain as ignorant as he chooses. I am aware that Mr. Clay's Bill is not intended to supersede the present Bill, which may include either a £6 or a £7 rental, but to be an auxiliary step downwards. This we must believe to be generous and considerate for the working class; and I can assure that honourable gentleman that I believe he was actuated by the best of motives, and desire for the real interests and good of the class which he is desirous to raise politically, socially, and morally.

I will now state a few objections that are likely to be raised against the Bill. Mr. Clay intimated in his Bill that a person who could write from dictation correctly, and understand the four rules of arithmetic, or do a sum in the rule of three, should be entitled to a vote. A good many would consider that a political test would be preferable—say an examination in John Stuart Mill's "Principles of Political Economy" and Hallam's "Constitutional History of England;" while others would favour a mathematical, classical, theological, literary, or scientific test, which would be more useful in making us good citizens. When we look a little deeper into this subject, we find that all knowledge is relative; that we are all more or less ignorant. For instance, a mechanic knows something which a gentleman who has graduated at either Oxford or Cambridge does not know; but still this gentleman would, perhaps, know one hundred times more than the mechanic in history and literature, &c.: but would you give the same power of voting for M.P.'s to the mechanic as to him who knows one hundred times more? Then, again, in this age of education, you will find young men of eighteen years, and even boys of twelve and fifteen years, much better scholars than either their aged fathers or uncles. What should be done for them? And why not admit the ladies to the privilege of exercising their right of voting for M.P.'s, if education is to be taken as a sufficient test?

And then, again, if a thorough book-education is so essential to good government, why not have our government transferred either to Oxford or Cambridge? But what same man would think of such a thing? I, for one, would as soon trust the government to the instincts of people as do such a thing; for, when Oxford could boast of having a Gladstone, they, at the late general election, rejected him for a Hardy.

Again, what does the Opposition party mean, but that gentlemen educated in the same university, and passing their degrees successfully, come to quite opposite conclusions about government? One believes and votes uniformly for Lord Derby's Government, and the other uniformly against his lordship. Until the seats of learning can appreciate real worth, and keep them as their representatives, we shall be some time before we can understand the meaning of an intelligent voter. Education taught the greater part of the House of Lords to reject and throw out the Bill to repeal or abolish the paper duty *twice*. They passed the Bill when they were forced by public opinion. Education did not enable either the House of Lords or that of the Commons to see the necessity and justice of the repeal of the Corn Law duties, until public opinion and necessity compelled them to abolish that unjust tax. Nay, it is now much the same as it has been—neither House is willing to repeal the Game Laws. It is somewhat encouraging to see that the House of Commons has been able to pass the second reading of the Church-Rate Abolition Bill; but it is very likely that the House of Lords will reject it. Well, Mr. Editor, I have thrown out these objections, as the most plausible ones I have, though they may be very imperfect, to show that there are sometimes learned fools to be found, and that ignorance is not confined to the working classes exclusively. But what seems to me most essential now in voting is real *honesty and worth*; and I have not been labouring to prove that great learning is incompatible with honesty and worth. I do not believe that, if the working classes were all enfranchised to-morrow, we should be any the worse governed than we have been; although I do feel grateful for the many improvements which have taken place in my time, but should feel more grateful if I and my fellow-countrymen could be all recognised as political citizens of this, our much-beloved land. In conclusion, Mr. Editor, I cannot see that an educational franchise would be much, if any, improvement upon our present imperfect system; and I think that manhood suffrage is the most legitimate and constitutional plan for giving satisfaction to the working classes. I fear I shall have trespassed upon your time and space too far.—I remain, yours truly, A Working Man.

March 16th, 1866.

To the Editor of the Working Man.

Sir,—It was with a great degree of pleasure that I read of the introduction of Mr. Clay's Bill, and I heartily thank both him and Mr. Gregory for the many kind and generous things they said of the working classes during the debate.

I am a working man myself, and I have spoken to several of my class about the merits of the Bill, and most of them are much pleased with it; but they are such as the Bill would enfranchise.

But I must also tell you I have read the debate on the Government Bill, which I hope will meet with the success it deserves on the next reading. I consider it a good part of a good measure, the remainder of which I hope will come in due time. Some of the members would make the House believe that the working classes don't want reform, but I think Mr. Bright's speech was a very good refutation to such statements; and, besides, the working classes have neither time nor inclination now for agitation, and the great majority of the House are well informed with their views on Reform; so the people are waiting patiently to see what the House will do for them.

If both these measures should pass, the classes they will enfranchise will be sure to feel the responsibility they will have upon them, and that they have another important duty to perform; that the ties of relationship to their country and its institutions have been strengthened; that a barrier has been broken down, which has kept two classes asunder whose interests are identical, and which, to work well, must work together.—Yours respectfully,

March 20th, 1866. A Working Potter.

To the Editor of the Working Man.

Sir,—As a working man, I am one of those who heartily approve of Mr. Clay's proposed educational franchise. In *theory* I would go much farther; but the time does not yet seem to have arrived when anything like manhood suffrage could be safely worked, although in the next generation it may be more possible than it is at present. I think it only right that, in making such a great innovation as the extension of the franchise to us undoubtedly must be, some precautions should be taken that the proposed change should prove as beneficial as possible to us—that it be made a blessing instead of a curse. I have no fear for the more educated portion of my fellow-workmen, but I do fear lest the uneducated might, if suddenly entrusted with the franchise, be tempted to listen to the counsels of leaders whose objects are certainly not the promotion of our welfare.

Men who will make some little sacrifice to obtain the franchise deserve to possess it. Mr. Clay's Bill would bring the electoral privilege within the reach of every man who spent a portion of his time in self-improvement, instead of wasting it at the public-house. This is why I like Mr. Clay's Bill. It tells us that if we like to help ourselves we may have votes. That is only right. The reward is worth the slight sacrifice demanded.—I am, Sir, yours, &c., A Voice from the Board.

London, March 22nd, 1866.

REPRESENTATION OF WORKING MEN IN PARLIAMENT.

To the Editor of the Working Man.

Sir,—We have now another Reform Bill introduced into Parliament, but whether it will pass into law remains to be seen. Anyhow, the principal thing for the working classes to consider is whether it will bring them a fair share of representation. I think not. It will, I admit, give a great number of men a vote who have not had one before—viz., those who will come under the class of £7 and £10 householders. But, then, will it be a fair way to extend the franchise to those who are *not householders*, by limiting it to £10 lodgers?

There are two classes in this country—viz., householders, or, more properly speaking, those who rent or own houses and land, and those who do not, but are lodgers; and in this last class are the great body of working men.

The *Daily Telegraph* lately made the remark, that

the principal point of discussion, when the Bill came on for the second reading, would be to define who are the working men. But I do not think that need be the case, because the first class of persons above mentioned—viz., house and land owners and occupiers—are entitled to a voice in the government of the country, the expenses of which they contribute to in a direct manner by the payment of taxes, &c.; and then the other class—why, they are the working men. The one is the Capital of the country and the other the Labour, and what is one without the other? And, if property is represented, why should not labour be? In fact, Mr. Gladstone admits that himself, for he stated in Parliament that it was an error to suppose that a labouring man should not be deemed to have an interest in the well-being of his country. If the working classes are to be represented, it must only be on the condition of their being intelligent working men, and not according to the amount of rent they pay. For instance, I know a man—a steady, sober, intelligent, industrious workman; he is married, and has no children, and, for economy's sake, occupies one room, for which he pays 3s. 6d. per week. I know another man, equally as respectable, married, and has several children, consequently he wants more room, and therefore occupies two rooms, for which he pays 5s. 6d. per week; but he does not earn, by 5s. to 10s. per week, as much as the other man; yet the latter will come under the £10 lodger class, while the former will not. And, again, I know another man, equally intelligent as the other two, and quite as respectable a member of society, but *he cannot afford* £10 a year rent. Now why should not all of these men equally have a vote? Why should their different circumstances make any difference? If the rent a man pays shows the amount of property he owns, or his respectability, industry, intelligence, or the rate of wages he receives, let it, by all means, be a qualification for voting.

I have a few words to say now on the opposition to any extension of the franchise by members of Parliament, and I think I need only instance that of Mr. Lowe. He seems to think that the unrepresented class are everything that is bad: "If you want venality, if you want ignorance, if you want intimidation, if you want an impulsive, unreflective, violent mob, go to the unrepresented class." By this time I hope Mr. Lowe is ashamed that he ever uttered those words; if not, it is high time that the unrepresented class are represented, and men of a different stamp than he sent to Parliament to give a better character of the working classes. I, as a working man, will admit that such qualities do exist, but they are the exception, not the rule; and if Mr. Lowe was to go into the first large workshop he came to, he would be surprised at the intelligence instead of the ignorance. And if he would take the trouble to calculate how many weekly numbers of working men's periodicals and weekly newspapers are sold, and what the contents are, he would find that an immense deal of knowledge was sought, and bought, and understood, and he would have one great fact to put alongside of his charge of ignorance to compare with. But even if what Mr. Lowe said was true, perhaps, if the unrepresented were represented, they would be the better for it.

I have a few words, also, to say of Mr. Griffith. He is so afraid of the extension of the franchise that he considers it "expedient to confer a plurality of votes on the superior class of voters, in such proportion as will be calculated to redress the preponderance of a single class of voters over the majority of the property, intelligence, and education of the country."

I merely quote this to show the sensitiveness, and, I may say, the fastidiousness of some M.P.'s on this subject. But, sir, I think that if working men could be represented on the condition of their being steady, sober, industrious, intelligent men, instead of the amount of rent they may happen to pay, such members as the above will not have any need to cast such slurs on the working classes. Anyhow, if we cannot get, by Mr. Gladstone's Bill, what we expect, we must take it as it is—as what we can get—and be thankful for small things.—I am, Sir, yours, &c.,

Jas. Thos. Rhodes.

TRADES UNIONS.

To the Editor of the Working Man.

Sir,—Allow me, in the first place, to inform you that I am a working man—an operative house-painter. I have read, with some degree of interest, your article under the head of "Trades Unions: their Limited Sphere," and can testify, from experience in my own line of business, and from the observation of others, to the accuracy of some of your remarks. Although there are some of the doings of Trades Unions not by any means commendable, but which, under certain circumstances, seem justifiable, particularly considering the element they have to contend with, yet, if their wrong doings are balanced against the good they have effected, both pecuniarily and socially, I think the judgment will be given in favour of Trades Unions. Your opening words, "that there never was an invention more natural or more defensible," is true, beyond a doubt; and was, and is at the present time, the most reliable means they have at their command—their strongest and most potent layer, whereby they have lifted themselves in a body to a social standing among trades, and are daily protecting the few privileges that custom has handed down to us, and increasing other little benefits of more or less importance. True perseverance, intellectual pursuits, and education may raise one, two, or a dozen in a trade; but the body, or the greater portion of them, would be left as mere drudges, were it not for the combinations that exist, and their determination to emerge all together, as a class, to one position. Then, again, the concluding part of the sentence previously quoted—"at the same time more crude and impotent"—needs a great deal of consideration before being accepted as perfectly correct, from more than one single point of view. It may have been very "crude" in its origin and birth; and what movement, society, or institution of any kind is not? It may be somewhat crude still; and that is the only thing that can possibly and fairly be advanced against its advocates; and, when that is admitted, some allowance can be made for some of the little acts that affect their honour as working men—more so when we consider that the employers whom they have to contend with are not over nice or scrupulous as to points of honour themselves. Consequently—not that I justify the means—they fight them with similar weapons. But if we carefully examine the system on which Trades Unions conducted their business some years ago, and compare it with recent improvements, and knowing what was considered their agressive tendency has now been brought within the meaning of the Friendly Societies' Act, even that objection can be considerably modified; and, as a greater proof of their increasing maturity, I may add that the plan that Trades Unions adopted in times past was to "strike when the iron is hot," or, in other words, watch the most favourable opportunity, even to the risk of ruining their employers and damaging their own personal interests. But now intelligence has superseded the old dogma; and if they find themselves suffering under any grievance, or their growing wants demand an increase of wages, they meet together and discuss the question *pro* and *con*, and give a limited notice of their demands, or the concession they wish to have made to them; and, if resisted or disputed by their employers, cases have been known that they are willing to submit it to arbitration, which, I think, is a point of honour gained, and proves that it is attaining maturity.

As to their artistic character, that has been explained already in your columns, by a correspondent signed "A Moulder."

Then, again, arises the question of their impotency. Now, it is pretty evident that working men generally squander nearly one-third of their earnings on things little better than useless. They are more or less open-hearted and sympathetic to those of their kind in distress, giving their mite to objects of philanthropy; yet, moreover, very suspicious of being cheated; but, as far as my knowledge of working men extends, I never find them in the habit of contributing two or three pence per week towards the support of Trades Unions without first clearly seeing and understanding the benefit that is likely to accrue therefrom. Then the fact that hundreds and thousands of working men of different trades throw their quota into the funds, and that hundreds of these societies are already in existence, and are daily increasing, with more objects than their personal independence and pecuniary benefit in the shape of wages; then the knowledge that these Trades Unions are the means of maintaining the few privileges they already possess, and that they have been the direct means of obtaining an advance of wages, which the necessities of the times require; reduction in the hours of labour, which the artisans of England stand in just need of, as well as those in a higher grade of life; the abolition of three-quarter time—a system truly obnoxious to all true working men; payments in public houses—monthly payments, which oftentimes increased a quarterly debt—and the provision that they make for sickness, accidents, annuities in old age, loss of employment, tools, &c., payments to the widows at death, and other little privileges which friendly societies will not ensure, is a very good evidence of their potency; and, were it necessary, and you would allow me space, many other things could be adduced to prove their power and effect, and the influence that Trades Unions have had in the formation of the moral character and respectability of working men, as well as their pecuniary position and their independence.—Yours respectfully,

A Society Man.

Cardiff, March, 1866.

THE GUILDFORD WORKING MEN'S INSTITUTE.

To the Editor of the Working Man.

Dear Sir,—With respect to your notice of the "Guildford Working Men's Institute" in No. 11 of your paper, I beg to state that you are right as to the date of its establishment—viz., 1856.

I can scarcely understand what you say about a division between the boys and men. I was a member of it for some years, and never observed the division spoken of. The reading-room was certainly separate from the room where the chess, bagatelle, &c., were conducted, but the boys and men had equal access to both. To the classes, also, all ages were admitted—at least, it was so in any I have joined or wished to join, and *I* am now but seventeen years old. Even some members of the committee were young enough to be classed under the genus "puer," or almost so, in my opinion. The *only* attempt at separation I ever saw was that lads under eighteen years of age were excluded from the bagatelle-board.

I perfectly concur with you as to the efficacy of the librarian, and should consider it a dark day for the institute if they lost him.

Hoping you will not consider me intrusive in thus addressing you, I remain, Sir, your respectful subscriber,

March 15th, 1866. H. E. N. E.

REFRESHMENTS AT THE GUILDHALL EXHIBITION.

To the Editor of the Working Man.

Sir,—At a meeting held in the Guildhall on the 12th instant, for the purpose of electing adjudicators in connection with the City of London Working Men's Exhibition, a working man present made several attempts to bring before the meeting the inconsistency of blending with the refreshment department the sale of intoxicating drinks, thus converting it into a tap-room or beer-shop.

Now, Mr. Editor, the ostensible plea for exhibitions, libraries, and working men's clubs, &c., is to counteract the pernicious influence of the public-house, and to draw the working population away from the temptation of strong drink. I quite concur with the working man's idea that an establishment of this kind, omitting the sale of strong drink, would be more consistent with the objects of an exhibition of industry.

Many present sympathised with the idea offered by this working man, and were sorry it could not be more prominently brought before the meeting, particularly as the space of the exhibition is so very limited.

The refreshment arrangement of the Lambeth exhibition is an example worthy to be followed, as no intoxicating liquors were allowed to be sold.—I am, yours respectfully,

March 19th, 1866. An Exhibitor.

WORKING WOMEN.

To the Editor of the Working Man.

Sir,—Your valuable little journal, the Working Man, has found its way into our house from its commencement, and, as I perceive its pages are exclusively intended for working men, pardon me when I say I wish something of the kind were issued for *working women*.

Providence does not always provide us a partner in marriage, and when it does, often sees fit to remove the same, leaving us with a family to maintain, under which circumstances I think you will see how acceptable a little consideration and advice would be.

Really, sir, it hardly seems fair that such great efforts should be made to advance the social interests of working men, while working women are left to struggle through their difficulties as best they may.

Hoping you will excuse the liberty I take in addressing you, I remain, yours respectfully,

A Working Woman.

TO CORRESPONDENTS.

Thomas Seabright.—The long grooves in the needles are made during the process of manufacture by the same means as the eyes are formed—by pressure.

A. S.—The superior economy of the Lenoir air-engine consists in the working. The engine itself so nearly resembles a steam-engine, that the cost is nearly as much. One of 1-horse power costs £80.

Balls, W.—To stain wood blue, dip it into a hot solution of sulphate of indigo, and, while still hot, place it in a solution of three ounces of cream of tartar in a quart of water.

W. B.—A cement for fastening brass letters upon glass is made of resin 150 parts, bees'-wax, 30 parts, burnt ochre, 30 parts, and calcined plaster, 2 parts. Apply while warm.

Orlop, W. B.—An average speed of twelve miles an hour is a very good one for an ocean-going steamer. River steamers have attained a speed of twenty-four miles an hour.

Allison, J.—Leather goods sent to hot climates are very subject to be destroyed on the voyage and upon arrival by vermin. The best security we know of is to rub the shoes or other articles with castor oil, either pure or mixed with one-half other oil or tallow, after which no vermin will attack them. Paraffine oil is equally effectual for a time, or until it is all evaporated.

Bellman.—Certain alloys of copper and zinc are so hard that they will cut steel, and serve well for tools. It will sometimes take a good workman a couple of days to cut a 1½ in. hole in a bell.

M. E.—The lime should be previously slaked, else it absorbs all the water, and causes the cement to set too quickly.

Thomas Tetin.—We hold to our statement that the smoky chimney is cured only by contracting the portion immediately above the fire-grate; in bad cases, this contraction will require to extend ten or twelve feet upward. The strong downward current is generally caused by the room communicating with another in which a fire is burning, the strong upward current of which is supplied with air drawn down the other chimney, causing it to smoke when there is a small fire in the grate.

A. B. C.—You do not require a book on the subject. The rules are very few, and are given in most English Grammars.

Hodgson.—We believe the engines you mention are at South Kensington, but cannot possibly ascertain without making a visit there; the same with regard to the cooking depôt.

Macbeth, W.—You can sell your grease without paying duty, tax, or licence; or the recipe, if you can induce any one to buy it.

John.—You had better commence with wood carving, as that costs but little to start with. Sculpture is costly, and far more difficult.

R. Lambert wishes to obtain the title of a book that will teach Plan Drawing for Mining.

Abel R.—Not more than 40 per cent. of copper is added to zinc to produce brass: if that proportion be exceeded a white alloy results, which is not marketable. A brass composed of 60 per cent. of copper and 40 per cent. of zinc is susceptible of being drawn or bent when cold, but cannot be forged or worked when heated; whilst, if 1·75 or 2·0 per cent. of iron be substituted for the same quantity of zinc, then a most valuable brass is obtained, capable of being forged at a red heat like iron, while its tenacity is nearly equal to that of iron.

Clive, T.—Silver or plated articles may be cleaned without rouge or other powder, by immersing them for half an hour in a solution made of 1 gallon of water, 1 oz. hyposulphite of soda, 8 oz. of muriate of ammonia, 4 oz. liquid ammonia, and 4 oz. of cyanide of potassium. The plate, when removed from this solution, is washed and rubbed with wash-leather.

T. W.—White of egg mixed with varying proportions of water is generally employed for the purpose; the paper requires hot pressing afterwards. Balsam of capivi is used because it is nearly colourless, and does not injure the brilliancy of the blue pigment, as a dark varnish would.

THE LONDON CENTRAL

Painters' Hall Company,

LIMITED.

Incorporated under "The Companies' Act, 1862," whereby the Liability of each Shareholder is limited to the amount of his Shares; and no Shareholder will be allowed to take more than Ten Shares.

CAPITAL, £2,000, IN 2,000 SHARES OF £1 EACH,

WITH POWER OF INCREASE.

Deposit on Application, 2s. 6d. per Share, and 2s. 6d. on Allotment. No Call will exceed 2s. 6d. per Share, or be made at less intervals than One Month.

Bankers.

BIRKBECK DEPOSIT BANK, 29, Southampton Buildings, Chancery Lane.

Solicitor.

Secretary (pro tem.).

WILLIAM HENRY TOFTS.

Temporary Office.

39, UPPER JOHN STREET, FITZROY SQUARE.

OFFICE HOURS: 7 to 9 P.M.; Saturdays, 3 to 5 P.M.

This Company is established for the purpose of Leasing or Building a Painters' Trades Hall, Library, and Reading Room, for the use of Trade, Benefit, and other Societies.

PROSPECTUS.

Seeing the great evil of having our meetings at public houses, and the necessity of improving our condition, both morally and socially—conscious of the difficulties and failures that have attended all former efforts in this direction—we have taken a broader basis as the foundation of our work, and a fixed determination that no effort shall be wanting on our part to ensure its success.

To remove the existing evils of public house meetings, the London Central Painters' Society members have formed a Company, on the principle of limited liability, for the purpose of leasing or building a hall in a central part of London, such building to consist of a hall capable of holding 1,000 persons seated, library, and reading room, with large rooms for the use of various societies to hold their meetings in, with committee and refreshment rooms attached, lavatories, &c.

The calls are made easy, to enable working men to take up shares. All are invited to co-operate in the scheme; and, to prevent monopoly, no shareholder will be allowed more than ten shares.

The promoters of the Company are, on allotment, to receive the money outlaid for the promotion of the Company, and no further remuneration until 10 per cent. has been divided amongst the shareholders; any profit over and above this rate to be divided amongst the shareholders and promoters, in proportion of two-thirds to the shareholders and one-third to the promoters.

For the many benefits it will confer upon them, it behoves the working classes generally to devote their entire energy to its advancement, and take every opportunity of making it known and appreciated; as we advance in years, numbers, and intelligence, great and numerous will be the advantages which those who come after us may acquire through our earlier exertions.

The promoters, in bringing this scheme before the working classes, feel the greatest confidence that, if supported by those it is intended to benefit, it will prove one of the greatest advancements of the age, both morally, socially, and financially, and will ultimately produce a large dividend to the shareholders.

FORM OF APPLICATION FOR SHARES.

To be retained by the Bankers of the Company.

No.

To the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED.

GENTLEMEN,—I have paid to your credit at your Bankers the sum of £ , being a deposit of 2s. 6d. per share on shares in the above Company in respect of such shares, or in respect of any less number you may allot me, and I agree to pay the further sum of 2s. 6d. on allotment thereof, and the instalments according to the terms of the Prospectus.

Name in full,

Residence,

Profession or Trade,

Dated this day of 186

If it is not convenient to make the deposit with the Bankers of the Company, the form may be sent by post to the Office of the Company, accompanied by a Crossed Cheque or Post Office Order for amount of the deposit, which will be paid into the Company's Bankers, and the Receipt returned by post to the Applicant.

BANKERS' RECEIPT.

To be signed by the Bankers and returned to the Applicant.

Received this day of 186 , of for the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED, the Sum of on account of an application for an allotment of Shares in the undertaking.

£ : :

The Original Chlorodyne,

Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c.

Earl Russell communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chloro-

DYNE.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chloro-

DYNE engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ½ oz., 1s. 1½d.; 1½ oz., 2s. 9d.; 10½ oz., 11s.; 20 oz., 20s.

Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [3

Hall's "Lung Restorer"

gives instant relief in Coughs, Asthma, Hoarseness, Sore Throat, &c. Mr. R. Brooke, Mirfield, near Leeds, writes, after suffering over ten years with an asthmatic cough, "Three 1s. 1½d. bottles cured me." Prepared by THOMAS HALL, Chemist, 6, Commercial Street, City side Great Eastern Terminus), London, and sold by all Chemists, in bottles, at 1s. 1½d., 2s. 9d., &c. [19

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength.
Sold by Chemists, Confectioners, &c., in most Towns. [4

The People's Own Tea Company, combining all the advantages of the ordinary Co-operative movement without its disadvantages. In 2,000 Shares of 10s. each; 5s. to be paid on application, and 5s. after the issue of first report. For particulars apply to Mr. Vaughan, Secretary, Crescent Mews, Vine Street, Minories, London, E. [1

YOUR CARD, SIR?
A Card Plate, including 50 Ivory Cards, with your Name elegantly Engraved. Ladies' or Gents' Post Free, on receipt of 1s. 6d. in stamps to W. F. GOOD, Engraver, &c., 8, Bishop Lane, Hull.
N.B.—This includes the Plate, Engraving, Cards, and Printing. [20

Happy Homes for Working MEN, AND HOW TO GET THEM. By the Rev. Dr. Begg. Price, in paper covers, 1s. 6d.; bound in cloth, 2s. London: Cassell, Petter, and Galpin, Ludgate Hill, E.C. Edinburgh: James Nichol.

Lately published, 12mo, price 2d.,
A Few Words on Woman's WORK; showing the paramount importance of Home Duties. With Remarks on Watch Work, Wet Nursing, and some other fallacies of the present day.
L. BOOTH, 307, Regent Street, W. [21

Now ready (*Tenth Thousand*), price 1s.; by post, 1s. 2d.,
Comfort for Small Incomes. BY MRS. WARREN.
"Altogether an invaluable housewife's companion."—*Liverpool Daily Courier.*

OTAGO LINE.

Olive Mount	1,200	A 1	March.

AUCKLAND LINE.

Pegasus	2,400	A 1	March 31.

FREE GRANTS OF FORTY ACRES OF LAND are given by this Ship to persons paying their own passage money.
STEAM TO AUSTRALIA AND NEW ZEALAND.

Ruahine (s.s.)	2,500	A 1	March 31.

The advantages of these lines are:—The fine class of the Vessels, which are specially selected for their adaptation to the voyage. Constant, regular, and punctual dispatch. Provisions not only most liberally supplied, but of the best description, including live stock, poultry, &c., without limit for the first-class passengers. General arrangements such as always to secure the approbation and recommendation of all classes of the passengers.
For plans of cabins, rate of passage, &c., apply to the country agents of the Line, or to
HOULDER BROTHERS & CO.,
146, Leadenhall Street, London, E.C. [24

John Moseley and Son, 17 and 18, King Street, and 27, Bedford Street, Covent Garden, London, W.C., CUTLERS, GENERAL MERCHANTS, and MANUFACTURERS OF MECHANICAL TOOLS—Saws, Tool Chests, Turning Lathes, Garden Tools, &c., Wholesale, Retail, and for Exportation. Established a Hundred Years. Reduction in the Price of Moseley's Warranted Saws, Genuine Gauged Plates:—

		£	s.	d.	
28-inch Best Half Ripping Saw	...	0	8	0	each.
26 „ Hand Saw	...	0	7	6	„
14 „ Brass-back Sash Saw	...	0	8	6	„
14 „ Iron-back ditto...	...	0	5	6	„

Saws same make, Second Quality (by some called best) of each of the above, 1s. less.
Carriage Free (if to the amount of 40s.) on receipt of Post Office Order, or postage stamps.
N.B.—These Saws are the same make as those that have given such great satisfaction for the last forty years.
Notice.—Messrs. Moseley and Son beg to announce that, in order to enable Country Workmen and others to obtain their superior Tools and Cutlery, they are now prepared to forward, direct from their Establishments, Parcels to the amount of £5 and upwards, to any part of the Kingdom, Carriage Free. Cash by Cheque or Post Office Order.
Moseley's Patent Electric Bells, Railway Signals, &c. Superior Galvanic Machines, from 18s., &c. &c. These machines are strongly recommended by the faculty for the cure of Rheumatism, &c. &c. [25

LEATHER, UPPERS, AND SHOE MERCERY.
J. W. McLellan, Leather Merchant, 47, Lambeth Walk, S., has one of the largest and cheapest stocks in London.
Prime 36 lb. Buenos Ayres butts, 1s. 6d. per lb. Prime 32 clean foreign, 1s. 3d. per lb. A very prime lot of enamelled seals, 4s. per lb. Men's and Women's soles, 1s. 4d., 1s. 6d., 1s. 8d., 2s. Scotch hides, 1s. 10d. per lb. Elastic webs, direct from the loom. Price List free by post.

KIT AND GRINDERY, WHOLESALE AND RETAIL.
Superior Brads, French and STEEL, 7 lbs. for 1s. 1d. Superior ink, 9d. per gallon. Copper toes, 2s. 2d. per doz. Men's iron-bottomed lasts, 2s. per pair. 20 lbs. clean English butts, 1s. 6d. per lb. Agent for Prout's Dubbin. 21 best plates, 5s. 6d. per gross. Scotch hemp, 2s. 7d. per paper. A liberal discount to all purchasers over £1, at L. W. McLELLAN'S, Lambeth Leather Warehouse, 47, Lambeth Walk, S. [26

Picture Frames for the CHILDREN IN THE WOOD, given with the *Illustrated London News*. Handsome gilt frames, glass, and back, 3s.; by the dozen, 2s. 6d. Maple and gilt, 5s.; by the dozen, 4s. Every description of Prints and Frames kept in stock. The Trade and Country Dealers supplied with maple and gilt Mouldings at the lowest prices. List of prices, 2 stamps, at George Rees, 57, Drury Lane (near the Theatre). [27

EASY MODE OF PAYMENT.
Every Description of General DRAPERY, TAILORING, AND OUTFITTING, At Moderate Prices.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to
FRANCIS RAVENSCROFT, *Manager.* [36

The Planet Permanent Building and Investment Society, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.
Offices—39, City Road, London, E.C. [37

Inventors Assisted in Securing, Carrying Out, and Disposing of their Invention. Apply to B. BROWNE and Co., British and Foreign Patent Office, 49, King William Street, London Bridge. A Pamphlet, gratis, on Cost of Patents, may be had on application. [31

Inventions Protected by Patent OR REGISTRATION at fixed and moderate charges. The "Inventor's Manual," free by post, or gratis on application. Apply to Mr. Brewer (late Barlow and Co.), 89, Chancery Lane, London.—Established Twenty-one Years. [32

Patents for Inventions.—Messrs. DAVIES and HUNT procure British and Foreign Patents for Inventions and Registrations of Designs, at moderate charges. Full particulars given in their "Handbook for Inventors," to be had (gratis) from No. 1, Serle Street, Lincoln's Inn, London, W.C. [33

A MARVEL OF CHEAPNESS.
The Shilling Drawing Case, Complete; containing Six Progressive Studies, after J. O. Harding, a Book of Whatman's Superfine Drawing Paper, Two Academy Drawing Pencils, and India-rubber. Post free for 14 stamps.—PACKER and GRIFFIN, 35, Poland Street, Oxford Street, W. Schools, the Trade, and Shippers supplied on advantageous terms. [28

THE WORKSHOPS OF THE WORLD.

FISH-HOOK MAKING AT REDDITCH.

Fish-Hook Making at Redditch.

WE cannot tell how hooks were made in the early ages of the world, but the specimens furnished by savage tribes at the present time are doubtless very similarly constructed, and of like materials. Wood and bone are substances which come readily to hand long before the use, or, indeed, the existence, of metals becomes apparent; and being easily worked, are soon brought to produce implements of considerable perfection and neatness. Many specimens of hooks, for

instance, made by the North American Coast tribes, are fashioned in bone, have two, three, or four barbs, and display singular care and finish in the execution.

The author of "Secrets of Angling"—a very rare and curious book, containing many poems of great merit—thus poetically fables concerning the origin of fishing and the first fish-hooks:—

"Then did Deucalion first the Art invent
Of Angling, and his people taught the same;
And to the Woods and Groves with them he went,
Fit tooles to find for this most needfull game.
There from the Trees the longest Rindes they rent,
Wherwith strong lines they roughly twist and frame,
And of each crook of hardest bush and brake
They made them hooks the hungry fish to take."

Whether Seth, Deucalion, or Belus, "the first Inventor of virtuous Recreation," originated fish-hooks and angling, we leave the poets to determine, and come down at once to later times and our own country.

Britain has produced a great number of writers upon this subject; but the earliest work printed in our tongue was from the press of Wynken de Worde, in 1496, written by Dame Juliana Barnes, and entitled "The Treatise of Fysshinge with an Angle." One of the most rare books is the one just quoted, "The Secrets of Angling; teaching the Choicest Tooles, Baytes, and Seasons," by J. D. (John Dennys), Esq., printed in 1652. This author says, "I use to make mine own hooks, so shall I have them of the best Spanish and Millan needles, of what sise, bent, or sharpness." In the next year (1653) was published the first edition of that most fondly-cherished of all piscatorial books—viz., "The Compleat Angler; or, the Contemplative Man's Recreation," by Izaak Walton. The gentle Izaak's pastorals, whether in prose or turned into verse whilst sitting on a "primrose-bank," quietly plying his hook and line, contain some of the sweetest, purest of thoughts, and will ever afford delight to English readers. Poetry, pleasant and tender thoughts, and the use of fish-hooks, seem at first sight to form an odd combination; but they are not unfrequently found together; and it is rather singular to note the coolness with which anglers, usually feeling enough in other matters, regard the torturing uses to which their hooks are applied. Listen to "The Gentleman Fisher" (printed in 1727), giving directions for baiting with a live minnow. "Put it (the hook) in at his mouth, and out at his gill; then, having drawn it two or three inches beyond or through his gill, put it again into his mouth, and the point and beard out at his tail."

Most of us see little of the use of fish-hooks, except by anglers, but the greatest quantities are consumed in the deep-sea fisheries, in the following manner: To a very long line are fastened, at intervals, short lines of about three feet in length, to each of which is attached a hook, and all are then let down into the sea, sometimes to the depth of ninety fathoms. Whiting, haddock, cod, hake, &c., are, or were, all caught in this manner.

Fish-hook makers have to exercise very great care to meet the requirements of fishermen, as the sorts are almost numberless, and the "fishers" are very particular in having the exact kind of hook to which they have become accustomed.

Redditch, the centre of needle-making, also supplies the world with most of the fish-hooks that are manufactured. The trade in these latter, however, compares very unfavourably with the former as regards amount, value, and regularity of demand. It is very fluctuating, there being a demand for certain sorts only in the different seasons, just while the fish are ready to be caught; and thus the workmen are ever busily employed, or have little to do—a state of things never very conducive to the welfare of working men, either in a pecuniary or moral sense.

Messrs. Henry Lewis and Son, of Redditch, have kindly afforded us facilities for sketching in their factory, and we will now endeavour to describe

HOW FISH-HOOKS ARE MADE.

The wire for making fish-hooks is procured in coils from Sheffield or Birmingham, of different qualities, varying with the kind of goods required. All first-class hooks are made from the very best cast-steel wire; other qualities are made of steel, but inferior; whilst the common sorts of large hooks are made of iron.

Cutting the wire into lengths suitable for the hook about to be made is the first operation, and is performed in two ways. The small and medium sizes are cut from the bundle or coil in quantities, between the blades of a pair of large upright shears, in the same manner as needle wires (see page 130); but large sea-hooks, made from thick wire, are cut singly, each length being placed separately upon a chisel fixed in a block or bench, and struck with a hammer. What are called "dubbed" hooks, are "rubbed" after being cut—that is, placed in a couple of iron rings, then made red-hot, and rubbed backwards and forwards with an iron bar until the friction has made every wire straight. Hooks, in general, are not rubbed, but are at once taken to be "bearded," or barbed, which is thus performed: The bearder, sitting at a work-bench in a good light (see engraving), takes up three or four wires with his left hand, between the finger and thumb, and places the ends upon a piece of iron, somewhat like a very small anvil, fixed in the bench before him. In his right hand he holds the long handle of a knife of peculiar shape, the blade of which, having the edge turned from him, is placed flat upon the wires, the knife-point at the same time being passed under a bent piece of iron firmly fixed, which enables him to obtain sufficient leverage to cut the soft wires and raise the barb, or "beard," this being done by *pushing* the handle forward, whilst the point remains fixed, as described. It becomes a laborious operation in the case of very large sizes, requiring, not merely a forward motion of the arm, but a strong push with the body against the handle.

They are next taken by the filer, who makes the points. (See illustration.) Each barbed wire is taken up separately, fixed in small pliers held by the left hand, then placed upon the end of a slip of box-wood, and filed to the degree of sharpness required. This is a matter of great nicety and delicacy. Common hooks are pointed with one file, but the finer sorts require two or three, flat and half-round. Large sea-hooks have the ends flattened, and the burr cut off on each side with a sharp chisel into a roughly-shaped point, previous to being filed. The points of "dubbed" hooks are not filed, but ground upon a revolving stone, and this process is called "dubbing."

When the points are made, the "benders" proceed to operate upon them. The woman seen in our illustration holds in her left hand a piece of wood, at the upper end of which is inserted a curve, or "bend" of steel, projecting slightly. Taking a wire in her right hand, she catches the beard upon one end of the steel curve, and pulls the wire round into the proper "hook" shape. For the larger sizes, the "bends" are fixed, not held in the hand.

Nothing now is necessary to perfect the formation but "shanking," which is done in various ways. Hooks are flattened at the shank end by a workman, who holds the curved part in his left hand, rests the end upon the edge of a steel anvil, and strikes it one sharp blow with a hammer. Some are tapered at the end with a file, whilst others are simply curled round, or "bowed," to provide a fastening for the line.

With steel hooks, hardening is the next process; but iron ones require converting, or "picing," before they will harden. The pic-hole is a recess with a large, open chimney, and in this recess is placed an iron pot, filled with alternate layers of hooks and bone-dust. At a little distance from the pot, bricks are built up all round, and the space filled with coal, which, when lighted, creates an intense heat, and to its action the hooks are exposed for about ten or twelve hours, allowed afterwards to cool, and are then fit for hardening. To effect this, they are exposed to a great heat upon pans in a fire-hole, and, whilst red-hot, poured into a cauldron of oil. Small hooks are afterwards tempered in a kind of frying-pan, partly filled with drift-sand, and placed over a fire. The larger ones are tempered in a closed oven, at a low heat.

When these operations are completed, they are taken to the scouring-mill, of which we have given an illustration. It is occupied by a number of revolving barrels, driven by steam-power, and containing water and soft-soap, into which the hooks are put, and allowed to remain for two or three days. At the end of that time, the friction having worn them all bright, they are taken out, and dried in another revolving barrel, containing saw-dust. Blueing, japanning, or tinning follows—of which the two latter are performed in the ordinary way, and the blueing is done by exposing them to a certain degree of heat in drift-sand over a fire, in the same way as small hooks are tempered. Counting, papering, labelling, and packing, complete the series, and the goods are then ready for the market.

Readers of the foregoing description can hardly fail to notice the extreme simplicity of most, or all, of the processes; and it seems strange that in such an age as ours there should be little improvement in the mode of production, as compared with the fireside practice of amateurs 200 years ago. In the "Secrets of Angling," before referred to, the author describes the making of hooks (as practised by himself) in the following terms:—"Soften your needles in an hot fire in a chafer. The instruments—First, an hold-fast. Secondly, an hammer to flat the place for the beard. Thirdly, a file to make the beard, and sharpen the point. Fourthly, a bender, viz., a pin bended, put in the end of a stick, an handfull long. When they are made, lap them in the end of a wier, and heat them againe, and temper them in oyle or butter."

The Weavers of Spitalfields.

A FEW HOURS WITH A RELIEVING OFFICER.

Comparatively few people are aware of the present condition of the Spitalfields weavers, a class which has for centuries added to the comfort of the people, and increased the national wealth. The people who are most familiar with the facts are the relieving officers, the clergymen, and a few others, whose duty enforces visits to the homes of "poverty, hunger, and dirt;" and one of these visits may be recorded for the benefit of those whose concern it is to know how trades sink and fall.

An accidental visit in an official capacity to Bethnal Green convinced me that there was much to be learned from an examination of the homes of this class—much that it would profit men who read the Working Man to know. I accordingly sought out one of the relieving officers, and he, knowing my profession and my purpose, willingly assented to my accompanying him that very hour upon his journey, undertaken in the discharge of his duty, to visit the homes of the out-door poor—namely, the poor who receive relief from the parish while living in their own homes.

We walked from the workhouse towards Mile End; but before we reached Bethnal Green Church my companion stopped at the entrance to a turning the road and footpath in which were undistinguishable the one from the other, being all black mud. This is no very great distance from the spot to which Legend's finger points as the place where the knight first saw the Blind Beggar's daughter, whose alms-gathered wealth—gathered on this spot—smoothed the path from seeming lowliness to rank and power. Beggars may have amassed wealth here in by-gone times, but workers do not now. Up this passage we turned, and I heard a peculiar noise proceeding from all the wretched-looking houses about there, which told me I was in the centre of a busy hive of workers—how busy and how ill-paid I knew only by repute. The noise was the sound of an industry as ancient as grave-making, and as lowly now—weaving. The busy "click, click," which seemed to come from all the one-storied dwellings by which we were surrounded, was nothing more than that made as

"The shuttle merrily
Goes flashing through the loom;"

for we were in one of those districts of the "Hospitality Fields" of a few centuries back, where certain Huguenots, exiled from their country for religion's sake, settled down, and carried on that then much-prized industry, the art and mystery of silk-weaving, which the descendants of those self-same Huguenots still carry on, and to which is given the name of Spitalfields weaving. It was at the door of one of these lowly houses that the "R. O.," for so my companion called himself, gave a knock, and the door opening, we had only to step across the threshold to find ourselves in a weaver's home. It was a rudely-furnished place, the furniture being a table, a couple of chairs, a bedstead, two children, and a loom. There was nothing on the boards as an apology for a carpet; but the apartment—dining-room, living-room,

kitchen, washhouse, bedroom, workshop, and nursery, all in one—was cleaner than one might have expected, where so much had to be done; and two women there were the reverse of slatternly-looking. One of these was washing; the other was at work at the loom. In answer to my questions, she said she was weaving silk for gentlemen's sun-shades—clearly a West End work, for few "gentlemen" visit the district when the sun is shining, except, perhaps, by accident, and then they take care not to carry sun-shades, lest they should be followed about by the precocious East End boys, as was Lord Macaulay, when he in this district bought a handful of songs of a street-seller, in his eager study of the people's muse, and was escorted through the "fields" by a crowd, anxious to hear him "sing 'em." It is said that a person can only do one thing at a time; but my worker at the loom kept her fingers, feet, and tongue going all at once. The loom had been in the family for generations; it was her late father's, and had been his father's; and when her father died, she had "to take to" weaving for the support of the family. "It's dreadfully badly paid"—and so it must be, for, with finding workshop, lighting, and all other employer's expenses, the earnings of work for the full six days do not exceed seven shillings a week—"nothing," said the woman, "to what weaving was" in those by-gone, "good old times." The "case" the relieving-officer had come to visit was a poor old woman, the aunt to the father of the family, and who had found shelter in this poor home and this poor family, where she preferred to stay to going in the "house." She was lying in a room up a ladder-sort of staircase, and the entrance to that apartment was through a trap-door. The case is only mentioned just to show that the kindest human feelings can exist where there is the cruellest poverty. The old woman must be a tie upon the hands of the household, and as the most she got altogether was of the value of half-a-crown a week, they had to give her home and attention without being stimulated by direct or indirect reward.

On going out of this house we traversed many streets of the same sort of buildings, only that their outward appearance was somewhat better than the first one visited. We had occasion to enter into some inhabited by others besides weavers, and found, on inquiry, that many skilled men had turned their backs upon their trade to become porters and labourers in the docks. The houses in this district are peculiar in this respect—they have been built for the weavers. This is shown by the upper floor windows—they are nearly all one-storied houses—being so formed as to admit all the light the frontage affords. A sick weaver, who had had a "doctor's order"—that is, had been visited by the parish doctor—was "looked up" by Mr. Relieving Officer, and this gave me an opportunity of seeing these more modern houses. I have been in many strange places in my time, but I never was in such a doll's house in my life as this. The place seemed built for a diminutive race, for an average man would have to walk edgeways down the passage; and the back "parlour" was no more, if so much, as seven feet square. The rent paid for this four-"roomed" house was four shillings a week, and the man had lived there twenty years. "They're generally old standers, these weavers," said my companion. I asked the man how much he earned a week, and his reply was ten shillings, when he went on without "play." My mind at the word "play" reverted to skittles; but "play," I was informed, meant the forced idleness of the weaver when one piece of work is finished and a new web is being laid, or "entered," as it is called, on his loom. He has to wait until the "enterer" comes, and he is obliged to be content with a play extending from three days to as many weeks. "The trade was not always like this, in my time," said the little weaver. "Oh, dear, no!" ejaculated his smaller wife. "Why, I used to have half as much more than I can earn now, when I was an apprentice, for pocket-money," chimed in the man. There were signs about the room that the man was a botanist—a lover of green fields, one, perchance, who found

> "Tongues in trees, books in the running brooks,
> Sermons in stones, and good in everything;"

and his whole appearance was such as to show that he was not a drunkard; and yet, after years and years of toil, when any extra need came—an aching head, or bruised finger, or few days' "play"—he was forced upon the parish for the assistance which the savings of his trade, if he had been properly remunerated, should have afforded him in his old age.

The next "case" was one which made a most painful impression upon my mind. We passed up the ladder-staircase of one of these houses, through a trap-door, and we were in the "place" of a velvet weaver. His idle loom was, of course, on the best-lighted side of the garret; the workman was lying stretched upon his poor bed, groaning with the pain of a terrible disease—a disease engendered by unwholesome air and insufficient food. Poor worker! whose best years had been spent in a sober, hard fight with poverty, hunger, and long hours of ill-paid labour, and who had been forced thus to succumb. That loom would no more be touched by him, and the unfinished work, commenced in hope, was a standing commentary upon the fallibility of all human expectations. When we reached the floor, and stood in the presence of the dying weaver in his workshop-home, we found a visitor before us—a brother workman, who had come in his hours of "play" to offer sympathy, but who was powerless to offer help. He was sitting on the only chair in the room—for every movable article of furniture had been "parted with" before application had been made to the parish. Here was a proof that the people have no pauper spirit within them, and that they struggle to maintain their independence. The proof that the poor, wretched fellow, who was striving to repress his groans, was a thoughtful, sober, humane man, was to be seen in the little studies of botany adorning the otherwise bare walls, and the care taken, even amid this pinching poverty, of two birds, whose song had cheered the weaver at his work. That he was honest and trustworthy, was proved in his being entrusted, in this wretched home, with most valuable property. I walked to the loom, and raising the covering of the newly-woven velvet, I saw that it was of a very superior quality—of such a quality as can only be purchased by those of the highest, or assuming to be of the highest society. I remarked that it was excellent velvet, and the pride of the poor wife, who was standing by, for the time overcame her grief, and she ejaculated, "Yes, sir; he's a beautiful workman," an opinion confirmed by the workman visitor in short and emphatic language. When I was told the price at which the work was done, I candidly confess I felt somewhat ashamed of free-trade, of society, of capitalists, and of workmen altogether; for this "beautiful workman," with his own machinery, in his own workshop, without any expenses of over-looking, could only earn about 12s. or 14s. a week, after labouring with all his skill for as many hours a day as would make a day and a half of some trades, the price of his labour being only 1s. 11d. per yard for weaving this exquisite velvet, whereas, a few years ago, he was paid 6s. a yard. The pain of witnessing an upright, honourable, hard-working man, thus forced to exist in a position which is a day-to-day struggle with poverty, was enough to make me, with all my knowledge of human suffering in all forms, groan aloud at this palpable wrong "somewhere"—or, as the hero of "Hard Times" would call it, "dreadfu' muddle."

All the scenes I witnessed I need not recount. The relieving officer had to pass into fever-stricken alleys, into actual fever-dens, where small-pox and typhus were raging, and everywhere he was a welcome visitor. Although the parish almoner, it was easy to see that a kind, not to say Mark Tapley spirit, of being jolly under circumstances that would drive many men to be cruel and heathen-like, had made him have a heart in his vocation; and he gave the parish mite, not with a show of treating the people as though they were thieving paupers, but as though he desired, as far as he could, to relieve their most pressing necessities in the manner best suited to their condition. That this was no "best behaviour" I soon found out, for I often heard a quiet, "God bless you!" from sick and dying lips when he was out of hearing. The last place I saw was that of a silk-weaver, who had 5d. a yard for weaving silk for umbrellas. He told me he was from an old Huguenot family, and he went and produced pieces of old-fashioned silks, such as were worn generations ago, and which were treasured up as specimens of his forefathers' great skill. The one poor room in which this man and his wife lived was clean and tidy, but would have looked comfortless to many a man of the "light porter" class. He told me that if he could only earn 9s. a week regularly they would be comparatively rich; but the "play" would not allow it. The "parish" was only sought for by this couple when the man was ill, and he expressed himself as very thankful for the doctor's order which had been given him.

Is there nothing in these "cases" for the profitable consideration of working men? Can they not read, in the present wretched condition of the Bethnal Green weaver, a caution against invariably bringing up the child to the father's occupation; and see in this the necessity, if a man's years admit of it, of turning attention to some other trade directly the skill of his fingers in the calling in which he has been trained does not yield him a sufficient remuneration? Had these weavers looked about them years ago, they would not thus be left to struggle face to face with poverty, in their later years, when their care, their soberness, and their industry for a lifetime should be yielding its fruit of an independent old age instead of the certainty of a pauper's end.

*Building Societies.**

The Mutual Benefit Building Societies we are now referring to, charge no interest to their borrowers; they cannot consequently pay any interest to members who choose to withdraw from the society before they get an advance. Not only so, but a very wise, although a very unpopular, provision in these societies is, that a member either cannot withdraw his subscriptions at all during the progress of the society, or cannot without submitting to a serious loss. A more liberal practice, however, has been springing up lately of allowing withdrawal without deduction or fee at all, excepting, perhaps, a shilling or two per share per annum for working expenses. But as we know how badly this plan is likely to work, and is really working, we must say a little more about withdrawal. In order to secure the prosperous working of these societies, it is very important that for the first few years at least the shares shall be all kept up; because, of course, the income depends at first entirely upon the members' subscriptions. Every advance that is made, however, strengthens the society, inasmuch as there is secured by every mortgage an annual payment equal in amount to several members' subscriptions; but it will take about seven years for the receipts by repayments to amount to a sum equal to the annual income by subscriptions; so that there should either be sufficient restriction to withdrawal to keep the original members in, or to induce them to provide substitutes, or else there should be inducements sufficiently strong held out to cause the withdrawn shares to be taken up again. Either way, for the society to be in a prosperous condition, the shares should be all subscribed for, at any rate, for the first seven years. After that period withdrawal may be allowed, because an annual income being secured from advances, the appropriations can still be made sufficiently frequent to satisfy the waiting members; and by paying out unadvanced shares, and abstaining from re-issuing them, the society will be materially shortened, because the retiring member receives only the amount he may have paid into the society, being certainly under £50, and by so doing foregoes his right to an advance of from £200 to £300. Such withdrawals, therefore, quite take the place of appropriations, while less than a quarter of the sum is required for them. Hence, members of these Building Societies should not complain, if, after the society has been kept full seven or more years, the withdrawals prevent the appropriations coming oftener. They should remember that the fewer members there are to participate in the appropriations—in consequence of withdrawals—the better chance the remaining members have of getting the right to an advance, which quite makes up for the appropriations coming even less often.

The following extracts from the rules of two societies will show how varied is the practice respecting withdrawal. The first is from a copy of rules certified in 1862, and states that "no notice of withdrawal shall be valid if given earlier than five years after the last time of the member taking part in an appropriation." The next is taken from a set of rules certified in 1863, and provides that "any member desiring to withdraw

* Continued from page 199.

from the society shall, after giving three months' notice in writing to the secretary, receive back the whole amount of money which he shall have paid into the society, with the exception of all fines that may have been paid, and 1s. per annum per share for working expenses." In both societies all the appropriations are balloted for, and arrears have to be paid by new members; so that the only reason we can find for the excessive liberality of the latter is in the too prevalent practice of societies, as well as individuals, to sacrifice stability for popularity. As it is of great importance to the working man to be able to withdraw his money, should occasion require, it is worthy of consideration whether it be not possible to arrange for advances *free of interest*, combined with *easy withdrawal*. Some societies are now trying the experiment. They provide against the extra number of vacancies which are certain to occur, by allowing persons to take the withdrawn shares without paying up the arrears; and it does seem probable that such an arrangement would keep the society tolerably full, and especially so where the plan of alternate sale and ballot is introduced, because a considerable profit must be made by the society, in which all the members will participate after a certain number of years (it should be about five or seven); so that, for a member to withdraw within the first five or seven years, although he may be offered the full amount he may have paid in, would be to lose his share of profits, and this would be a strong inducement to make members hold on as long as possible, and probably enable them to find customers for their shares at a premium. Some persons are in the habit of drawing out of one society as soon as a new one is introduced to them, and which suits their fancy; and they use the specious argument that they can have use of the money saved by means of the former, and still stand the same chance of getting the appropriation in the latter. "A rolling-stone gathers no moss;" and such persons aim at the two birds in the bush, while losing the one in their hands. A working man should, we think, reflect that for every £200 or £300 he may be able to subscribe for in a Building Society, he will be that amount better off at the termination of the society; and that if he is constantly getting into new societies, while he has the *chance* of getting an appropriation, he is unquestionably losing the *certainty* of realising that amount at all. The duration of these societies depends upon the amount of the subscriptions, and the sum fixed upon for each appropriation. The larger the amount of the subscriptions, and the smaller the amount of the appropriations, the shorter will be the duration of the society; and, of course, as the subscriptions are lowered, and the appropriations increased, so is the society lengthened.

Men who have Risen from the Ranks.

VI.—SAMUEL WILDERSPIN.

The newspapers, in a short paragraph, have just announced the death of a man, who first came into public notice half a century ago—who rendered peculiar services to society, and made for himself a name which entitles him to distinctive remembrance. He has been forgotten, and may be said to be entirely unknown to this generation; so that the announcement of the death of Samuel Wilderspin has attracted the interest and attention only of those familiar with the earlier stage of social progress in England. The third edition of his own account of his system of Teaching was published by Simpkin and Marshall so far back as 1825, now forty years since. No Biographical Dictionary to which we have been able to refer—and we have consulted many for the purpose—makes mention of his name. He has never had a place among Men of the Time. We believe an early volume of the *Phrenological Journal* gave an article upon him, and twenty years ago Mrs. Mary Leeman Gillies gave a notice of him in the *People's Journal*, then conducted by Mr. John Saunders. In Educational Magazines and Parliamentary Blue Books, in Proceedings of the Board of Education, in old Review articles on the Bell and Lancasterian systems, his name turns up; and very possibly the public may one day see some complete biography of him. As far back as 1836, there was published an account of the origin of Infant Schools. We believe some details were also given of Mr. Wilderspin's connection with them; the publication of which led to a controversy at the time.

Samuel Wilderspin belonged to the very humblest classes. He first came into notice as a pupil of Mr. Buchanan, a young weaver, whom Mr. Owen had trained at New Lanark to be a teacher of infant schools, and whom Lord Brougham and the Marquis of Lansdowne borrowed from Mr. Owen, that they might introduce the Infant system into London. Certainly Mr. Wilderspin arose from the ranks by labour, for successful school-teaching is very hard labour—but young Wilderspin also arose from the ranks by smiles and vivacity. His geniality and enthusiasm were his fortune. His genius lay in his capacity for studying the ways of children, the patience with which he taught them, and the devotion with which he gave all his time and powers to mastering the modes of instructing them. His natural atmosphere was the school-room; all the excellences of his nature came out there. He had not the large views which the animated founder of infant schools—Mr. Owen—had; he owned not the genius, or resource, or originality, which Pestalozzi possessed—parts of whose system he availed himself of—but in a lesser degree and in his own way, Samuel Wilderspin was a great teacher.

Samuel Wilderspin began his distinctive work as a teacher in 1819. At that time the possibility of establishing infants' schools was looked upon as very doubtful. Only small adult schools were generally believed in, and these could not be conducted without a copious application of birch. Even in university and college schools, flogging was believed to be indispensable, and a schoolmaster with a strong arm was thought to be as necessary as one with a strong head. Everywhere the schoolmaster was a terror, and learning a pain. If the discipline of the rod and the sternness of the schoolmaster were necessary in schools where the children of gentlemen attended, or with youths whose reason could be appealed to to preserve order, how much more necessary must strict discipline and severity in the teacher be with the children of the poor—ignorant, wild, young, unreasonable, and unmanageable? And when gathered together in great numbers—not in twenties and thirties, but in hundreds—it was supposed that a little crowd of schoolmasters and bundles of birch would be necessary to preserve order and impart instruction. Wilderspin's plan was to teach hundreds of children at once, in one class, with one or two teachers, and without the rod. The children were in favour of it, but the public shook their heads at the plan as mere good-natured Utopianism. It was at Spitalfields that Mr. Wilderspin obtained his first triumph. There it was, to use his own language, that "two hundred and twenty-eight infants, under six years of age, were assembled together at one time; and there it was first proved that one man and one woman, without assistance, could teach, delight, make happy, classify, and manage, so many little creatures without a tear and without fear." This was certainly the pleasantest thing that ever came out of Spitalfields. No one would have expected, in that dreary region of low wages and privation, that so sunny a system could be developed. Wilderspin has told of the many difficulties which he had to encounter in learning his merciful art. He often found himself in a crowd of rebellious children, whom no speech could pacify, no threat reduce to order, no expedient win to silence. One day, when the juvenile rebellion was raging around him, it occurred to him to take off his cap and hoist it on a stick. The novelty of the thing struck the insurgent urchins with astonishment; every eye was turned to the unexpected effigy of the schoolmaster's cap on a stick. Curiosity was awakened, silence was established, and every one listened for an explanation. This opened the mind of the ingenious teacher to modes of imparting lessons to awaken interest instead of exciting fears, and he became distinguished for his happy management, and as the practical contriver of a system in which instruction was blended with love and play. Others before him had proclaimed the possibility of doing this on a yet nobler scale, and had even realised it; but he had the practical talent to carry out and apply as much as was possible of the plan under the circumstances existing in the school system of his day.

His merits as a teacher soon became recognised. His experience in Vincent Square, Westminster, and Spitalfields, attracted the attention of eminent friends of the working class, and a public meeting was held in the Freemasons' Hall, presided over by the Marquis of Lansdowne; and a School Society was established. The public, however, did not support it, and it fell through for want of funds in 1826. For many years Mr. Wilderspin went about the provinces as a kind of Infant School Missionary; he visited Scotland and Ireland, and to every town to which he was sent schools sprang up under his feet.

It was not known or not believed by the public that it was easier to teach children than men; it was contrary to all expectation. Mr. Wilderspin had mastered this truth, and, what was more, could show it in practice, and he thus made an Infant School system possible. The plan involved simplicity and cheapness, and cheapness for once was associated with kindness.

He held public examinations of little children, to the wonder and astonishment of their parents. Mrs. Leeman Gillies tells of the impression which he left upon the minds of those who witnessed his extraordinary exertions. She says, "He taught us to love. He taught us to think. He taught us to learn. But for *him* we had been ignorant and criminal—through him we are informed and Christian."

In 1838 the Board of National Education at last took up his plans. The Commissioners sent him to organise their national schools, and teachers everywhere were taught on his system; and he had the satisfaction of seeing the success of his years of toil and enthusiasm recognised. But fame found him poor. Pestalozzi lived and died in extreme poverty. It seems the lot of those who care much for others to be incapable of taking care of themselves; and it seldom occurs to society to take care of them. Philanthropy is a profession which never pays, and Wilderspin, like many others, found himself, when old and worn out, with no prospect for his old age. He had five daughters, all unprovided for. Happily, in the days of the *People's Journal*, attention was called in its pages to the destitute condition of the great instructor, and steps were taken to provide for his remaining years. Sir Robert Peel, with his usual kindness (shown in many a similar case), sent £50 to assist him whilst some plan was devised for his advantage. Mrs. Gaskell (the afterwards famous authoress), Mrs. Gillies, and many other ladies, exerted themselves on his behalf; and one day, in 1846, a handsome and valuable present was made to him at the Rev. Mr. Gaskell's house. Distinguished persons were present. Mr. Monckton Milnes (now Lord Houghton), Mr. Charles Dickens, Mr. Thornton, and Leigh Hunt made appropriate speeches on the occasion. We believe that afterwards the Government gave Wilderspin a pension, and his remaining years were spent in well-earned dignity and competence. He died, a few days ago, in the neighbourhood of Liverpool, where he usually resided, leaving behind him one of the pleasantest memories in the annals of modern Education.

*Employers and Employed.**

We have already explained the principles of the law affecting master and servant with regard to the following points:—1, The Engagement entered into between them; 2, Their mutual Duties and Liabilities; 3, Wages and their payment. We have lastly to consider its bearings on the subject of

DISMISSAL AND CHARACTER.

A contract of service, as we have sufficiently set forth in our first article, can properly be terminated only by mutual consent, or due notice given on either side. But there are circumstances which are held to justify an abrupt dismissal of the servant by his employer, and even the refusal to pay him wages for any portion of the uncompleted term of his service. Thus, if a weekly, monthly, or yearly servant give a master such legal ground of dismissal, he can not only be sent immediately away from the service, but cannot recover wages for even that portion of the term which he may have served without complaint. The reason is a fair and just one. The master suffers by the act which has caused and justified the dismissal in the eye of the law; and he is, moreover, put to the inconvenience either

* Continued from page 195.

of dispensing with the service for a time, or of finding a substitute for the servant so dismissed.

But the servant is protected by the law against any unjust or oppressive exercise of this principle; for if he has been improperly dismissed, he can recover his wages not only for the time he may have served, but also for the uncompleted term of the contract. If his service be yearly, and he has been improperly discharged at the end of six months, he can recover wages for the entire year; and so for any shorter term. He can do this by action for debt as to the term already expired, and for damages under a special count as to the uncompleted period. In some cases he may even obtain more, as damages, than the wages to which he would have been entitled at the expiry of the completed term; for if he has suffered in reputation by the wrongful dismissal, or has been unduly hindered from obtaining another engagement, a jury will take that into consideration, and order him compensation accordingly. On the other hand, if he has obtained, or might have obtained, equally eligible employment after his dismissal, a small compensation will be held to indemnify him for his loss.

We will now explain what are held by the law to be rightful grounds of dismissal without the ordinary notice. The first of these is gross moral misconduct in any shape, as affecting the master or his household. Embezzlement of the master's money or his goods, to the value of the smallest coin, will be held to justify such dismissal; for a servant who is found to be dishonest with regard to small things, cannot be trusted in anything. A servant, also, who abuses his master, or disturbs the peace of his family, may likewise be sent away without warning.

Secondly, wilful disobedience on matters within scope of the service, is lawful ground of dismissal. The master is allowed to judge as to the precise way in which any act of service should properly be performed, or the time of its execution. And under this head, a refusal to work during the customary hours, or to conform to the usual hour for dinner, has been held to be an act of wilful disobedience within the meaning of the law. But if it can be shown that the matters in which the disobedience may have arisen are really of trifling moment, causing no inconvenience to the master, and implying no reluctance to do his duty on the part of the servant, the law will not consider this just ground of abrupt dismissal. For all such shortcomings the master has sufficient remedy in the usual notice to his servant.

A third rightful ground of dismissal is habitual negligence in the performance of the work, or doing it in a careless, slovenly, and inadequate manner. To this may be added a servant's absenting himself repeatedly from his duties, and refusal to submit to domestic regulations. But temporary absence without leave, producing no serious inconvenience, and not repeated, has been held to be insufficient ground of dismissal; as also absence for the purpose of procuring another situation, such absence being warranted by custom.

In dismissing a servant on any of these grounds, a master is not compelled to assign the precise reason for dismissal. It is enough if he can show that sufficient cause actually existed at the time of the discharge. And it is to be understood that in all these cases, what is sufficient to warrant the dismissal, is justification also for the refusal to pay wages for the uncompleted term of the contract.

If a servant should bring an action for wrongful dismissal, it is sufficient that he should maintain that he was "ready and willing" to continue the service. It is not necessary to his success in the action that he should actually have offered to do so.

We now come to the subject of giving a character, in which misconceptions frequently arise. There is no law to compel a master to give any character of a servant, unless it has been an express part of the contract that such character should be given. And the servant who may even find himself unable to procure another engagement, by reason of the master's refusal, has no remedy by action for damages against him. A master may really have had good ground for a dismissal, but may suffer injury by revealing the consequences of the servant's wrongful act leading to the dismissal, which he might have to do if a character were given. Or, in consideration for the servant, he may be indisposed to speak what he really believes respecting him, without certain knowledge. But whether there be or be not any such reason, the law on the point is clear that a character may be withheld.

A master is morally bound to speak the truth respecting his servant if he give him a character at all; but even if he should give him a false and injurious character, he is liable to no legal penalty, if the misrepresentation has been made in good faith, and without malice against the servant. It is essential that the servant should be able to prove that the character given is both false and malicious, to entitle him to maintain an action for damages. Malice might be inferred by a jury from attending circumstances, showing the existence of ill-feeling towards the servant on the master's part.

A master who gives a false character of his servant, in order to induce another person to take him into his service, is liable to that person in an action for damages for any injury he may have suffered in consequence. Personating a master or mistress with a view to giving a counterfeit character, is an offence punishable by a fine of £20, or imprisonment, in default, for one to three months with hard labour.

Letters from Lancashire, by a Lancashire Lad.

VI.—OPERATIVE BOOK CLUBS AND BOTANICAL SOCIETIES.

Those who are fond of taking long walks may sometimes obtain more entertainment than they reckoned upon, by meeting with some humble naturalist, engaged in sedulously pursuing his studies of flowers, mosses, or insects. I do not think it is possible to name any part of the country which has been so celebrated for its production of workman naturalists as this county of ours. For a very long time, scientific men have recognised their indebtedness to hand-loom weavers, and to others occupying equally humble stations in life. A friend of mine has recently lent me an old scrap-book, containing cuttings from old *Manchester Guardians* and other papers, and all bearing upon the life and work of these men. I may make an interesting letter or two from what is thus placed before me.

Many of the naturalists of whom I purpose speaking in this and the succeeding letter, were brought up under the old form of Lancashire life. The newspaper cuttings which my friend has preserved contain descriptions of rambles in search of these men, and of their book clubs and discussion classes. The ground gone over has been trodden by myself many times. Lying between Manchester and Rochdale, it contains as many memorials of the recent past as can be found in any ground of equal extent. Within it John Collier produced the works known as the "Tim Bobbin" series. Within it also occurred most of the events which are recorded with such literary skill in Bamford's "Life of a Radical." Here Cobbett—

> "Gentle Nature's stern prose bard,
> Her mightiest peasant-born,"

as Ebenezer Elliott calls him; here Oastler, the "Factory King;" John Fielden, whose name will be always associated honourably with the first and most terrible phase of the factory system; Feargus O'Connor, with his Chartism and his land scheme; W. J. Fox, the "Weaver Boy" of the League—all found their keenest and truest friends. Political feeling was very strong in these parts, and the cottagers here read and took to heart the shot-like words which Cobbett hurled amongst them so plentifully. But they cared for something besides politics. Indeed, during the time of greatest agitation there were some of them who were so addicted to "buzzart catchin'," and "yarb (herb) huntin'," and to the study of mathematics, that the hot rush of political feeling passed almost without touching them. Then, and at a later time, they formed little book clubs, holding weekly or monthly meetings, to exchange books and to discuss such topics as were of general or special interest. I find in my scrap-book a description of some of these clubs. One was held in an old-fashioned house, occupied by a regular "farrantly couple," and their grown-up sons and daughters. Here, some dozen or more years ago, about a score of working men, most of them weavers, would meet once a month, pay their penny subscription, and select the books for the next four weeks' reading. These men might be, perhaps, too old-fashioned to fall in with the new notions about mechanics' institutes. However that may be, they preferred to get their books in the way described. Passing from this house, the writer went on to the house of a "yarb" seller, who was noted for the cures wrought by his simples, and who resided in an ivy-bound cottage standing in the country lane. The herbalist was seen to be over threescore years old, and was attenuated enough, and had just the thin grey hair—the "toppin'," his neighbours called it—which would enable him to seem like, if not to enact the character of, the apothecary in "Romeo and Juliet." The ceiling was mostly hidden by the number of parcels of dry or drying herbs, which hung upon the strings running horizontally from side to side. The trim garden at the end of the house was well filled with growing herbs. Here the visitor saw "hyssop, thyme, ringwort, horehound, camomile, wormwood, tansy, broom, great water-dock (for scurvy), lovage (for cattle), sweetgale, St. John's wort, mother-of-thyme (for nervous disorders), and yellow maiden-hair (for coughs and colds, once accounted a specific for almost all disorders)." The old man knew something, too, about books, and chatted pleasantly respecting them; and he knew much of an unpleasant kind of the hard times through which he had lived. He was not too humble to be moved from his home to the New Bailey, and thence to Coldbath Fields Prison, under warrant from the late Lord Sidmouth, and the poor fellow was thought to be so dangerous that he was kept in Colchester Gaol until the expiration of the Habeas Corpus Suspension Act. This old man being acquainted with such of his neighbours as were intelligent, told his visitor the way to George Whittaker's, where another book club was held.

George's was a farm-house, standing in an isolated position at the top of a huge meadow, and was approached by the visitor treading along a road so old that perhaps it was made before Cæsar came, and saw, and conquered this island. The club was established in 1830, with about ten members, and had no more than twelve when the writer of the articles from which I am gleaning visited it a dozen years ago. The members met on the first Saturday in every month to pay subscriptions, exchange books, and to converse together. At Christmas they held their annual meeting, had a substantial supper—perhaps a huge potato-pie with "whoam-brewed" to wash it down—and then proceeded to business. The sort of men of which this society was composed may be understood from the following statement. There were two book-keepers at factories, two brick-setters, four farmers, one shopkeeper, one foundryman, and three weavers. Their library contained just the books which one would expect to find. Cobbett was largely represented in it, and Adam Smith, Tom Paine, Robert Burns, William Howitt (in his "History of Priestcraft") were names seen on other title-pages, and indicated the political tendencies of the members. Proceeding with his inquiries, the writer found other book clubs, all supported entirely by working men, and all being quietly conducted. Going along, too, he learned something of a peculiar custom which was observed in the rural "fowts" and the isolated dwellings of the labouring populations of Chadderton, Royton, and the scattered hamlets about. The custom is called "brewis-eating." A stranger walking about here on Sunday afternoons, might chance to step into one or other of the cottages, and would, no doubt, be surprised to find the chief room filled with company. If he sat down he would probably have a pot of ale placed before him, and the conversation, or rather the discussion, which his entrance had interrupted, would be resumed. He would find that some of these men—wearing fustian jackets, and having gaily-coloured silk neckerchiefs round their throats, with very slightly-starched "dowlas" linen collars falling open in the front, sometimes *à la* Byron—are able disputants. It is a pleasure to listen to them. All of them are shrewd; one or two, slightly pretentious in their language, are replied to by others who exhibit considerable satiric power. After the discussion has gone on for some time, it is postponed because of the "brewis." This is a hot beef-stew, having toasted oat-cake soaked in it, and is a favourite dish with these country people—is, indeed, so much liked, that those of them who migrate to the big towns take their taste for it with them, and to

this day no small amount of business is done on Sunday mornings by the smaller butchers in supplying this stew for breakfast. The feast over, the discussion goes on again until, with the approach of twilight, it is either ended or adjourned to a future time. In these places the subjects with which the names of Cobbett, Fielden, Feargus O'Connor, Fox, Cobden, and Bright are most frequently associated, were discussed with such earnestness and fulness of information as showed the intellectual and moral standing of the men. Resuming his inquiries, the writer found a reading-room and library at the extensive foundries of Messrs. Platt, of Oldham. Even then this workshop library had above a thousand volumes in it, and has since had many more added. I may at another time say more of that and of other factory institutions. At present I have said enough to show that long ago in the outer districts of Lancashire there was considerable intellectual activity amongst the operatives.

Passing from book clubs, and their political and general associations, I should like to say just a word or two about the botanical societies which have, from time to time, been established by the operatives of this and the neighbouring counties. It will have been noticed in what has been read above that the meetings of the book clubs were usually held on a Sunday. They were held on that day because the members were then all at liberty. The botanical societies were also held on Sundays. About sixteen years ago, one Joshua Barge, keeper of the "Ostrich," Rooden Lane, Prestwich, was charged with allowing men to assemble in his house during the time of Divine service. He was convicted and fined; and some inquiries being made, it became known that the men who had met at the "Ostrich" were men in humble circumstances, and members of a botanical society which had then held Sunday meetings for more than seventy years. Only once before had an information been laid against them by the police, and on that occasion conviction and fine followed. These societies had existed for a very long time, and it is probable that Ray, who has been called the founder of the English school of botany, obtained indirect aid from their members. In 1850, there appeared in the *Manchester Guardian* a short paper on the history of these societies. The paper was written twelve years before its appearance, by Thomas Heywood, of Cheetham Hill, himself one of the working men botanists, and ranking high in his class. His writing exhibits the smallness of his literary culture, but reveals the enthusiasm with which he regarded his pet study, and the fulness of his knowledge respecting it. He holds that the entomologist, the geologist, and the anatomist, must all yield precedence to the botanist. There is something objectionable either to taste, to health, or to feeling, in each of the other studies, but in *his* all is pleasant. He has only to step across the threshold of his home to be at once surrounded by a multiplicity of beauties, the study of which leads him to "admire and adore that Being who could frame everything with such infinite wisdom." He speculates upon the most remote ages in which there were botanical collectors, and shows that the monks in the Middle Ages were fond of his science; that they collected, and grew near their monasteries, not only the plants which were native to the soil, but others which they brought from abroad. He tells us that to them we owe the naturalisation of the nightshade (*Atropa belladona*), the snowdrop (*Galanthus nivalis*), and others. He shows that there was one Sunday botanical society held at the "Old Check Cap" public-house, at Eccles, in 1775, and that before the outburst of the French Revolution they were common all over the county. The meetings were very orderly. Sometimes the peace officers would drop in, and express themselves satisfied and pleased, and sometimes the clergyman himself, after his labours in the church were over, would come and partake of the information which each member could contribute towards the better understanding of the beauties and uses of the inanimate creatures of God. Amongst these men were some to whom our greatest and most renowned naturalists have acknowledged their indebtedness; and the modesty with which they opened their stores of knowledge—most of it obtained from close, scientific observation, in hours stolen from labour or rest—was one of their most noteworthy characteristics. In my next letter, I will sketch the lives of a few of these men.

Parkesine.

Those who listen or read with a view to their own improvement, or with a desire to store their minds with useful knowledge, will, in all probability, consult both cyclopædias and dictionaries of arts and sciences in vain for the word which heads this paper, and which represents a material destined to be applied to many useful as well as ornamental purposes in life. This, of itself, might be taken as an argument in favour of the newness of the substance; and as it is a characteristic of the human mind to be almost continually searching after novelty, it may find some gratification in being informed that Parkesine is eminently distinguished by this quality. The word itself is formed from the name of Mr. Parkes, the inventor of the material, and also the fullest interpreter, so far as we are aware, of the variety of properties of which it is possessed.

The circumstances which led Mr. Parkes to the invention of Parkesine, arose out of the reflection and observations of upwards of twenty years. During all that time he cherished the idea that a new material, which should, to a large extent, partake of the properties of ivory, horn, hardwood, tortoise-shell, india-rubber, gutta-percha, and similar substances, might be invented. Such an idea would, to any one destitute of chemical knowledge, appear of impossible realisation; yet it has been realised, by what now seems to be the simplest means, and no one as yet can foresee all the useful purposes to which the product which has sprung from it may be capable of being applied.

The first appearance of the material in its rough state was at the great Exhibition of 1862, when it attracted a considerable degree of attention, and received a prize medal. Since then its manufacture has been immeasurably improved, so much so that it now seems to be in a fair way to supersede the use of both india-rubber and gutta-percha for many of the useful purposes to which these have hitherto been applied.

Parkesine is composed of pyroxyline and oil, either alone or in combination with other substances. We must observe that the sense in which the word pyroxyline is here to be understood, is as expressive of a less explosive preparation than the more highly converted compound known as *gun-cotton*—a material which has hitherto been used for blasting, military, and photographic purposes only. After much labour and long investigation, Mr. Parkes observed that the solid residue left in the evaporation of the solvent of photographic collodion, produced a hard, horny, and waterproof substance. This suggested the idea of employing in all his experiments pyroxyline, xylodine, or some similar matter as a base for further operations. He found, however, that the solutions of collodion, in 1855, when he took out his first patent, were practically unavailable for carrying out his manufacture to any great extent, or producing it in such masses and forms as would render it convertible into objects of general utility. This forced upon him a new series of experiments, with the view of discovering a more economical mode of production, and by dint of patient labour and perseverance—mostly the price of every great invention—he found that, by improving the character of the pyroxyline and employing different solvents, he made great advances towards the results he desired to obtain. The economical method he pursued in the manufacture of the pyroxyline or other similar compounds, and the use he made of improved and less costly solvents, enabled him greatly to cheapen his material. The consequence was, that after many years of labour and thousands of experimental trials, he succeeded in producing it in any quantity, and at a cost of less than *one shilling per pound* and upwards, according to quality. In proof of the value of this achievement, we may state that before the invention of Mr. Parkes, the cost of a similar article was £6 10s. per pound, which, we need hardly say, placed it entirely out of the reach of the multitude.

Some of the means by which this immense reduction was obtained in the price of an article capable of such general application to the useful and ornamental arts of civilised life, have been explained by its inventor. One of these was the employment of waste cotton, in the shape of rags or other forms, which he was enabled to procure at a very low price, and, also, the use of improved solvents, which the invention of special machinery enabled him to recover. These were two of the means, but he was, likewise, able to dissolve the pyroxyline in a wet state, which enabled him to economise both the time and the space, as well as to avoid the risk in drying which hitherto had to be incurred, but which recently improved machinery put it in his power to accomplish otherwise. These were the principal means which facilitated the production of the article at such a price as will stamp it with great commercial value, by enabling it to be converted into many useful applications. In all extensive manufactures this must always be one of the very first consideration. If a material cannot be widely as well as cheaply employed—and it cannot be widely employed if it cannot be cheaply produced—the extent of its sale must be both too circumscribed and slow to be sufficiently remunerative. It is, therefore, in this particular that we perceive the value of such an invention as Parkesine. The substances of which it is composed can be obtained in any quantity, and as its manufacturer has a perfect control in the manipulation of these substances, he can on all occasions ensure not only a regularity of supply, but any quantity of the quality required. This is certainly not the case with some of the products which it seems likely to supersede, such as ivory, india-rubber, and gutta-percha. The first of these, being an animal production, is at all times subject to an irregularity of supply; and in reference to india-rubber and gutta-percha, although the products of plants, the same observation applies. Of the first there is only a limited quantity yielded every year; and the trees which yield the gutta-percha are entirely destroyed when their produce is abstracted from them. These circumstances, therefore, must more or less control the supplies, whilst, in the case of Parkesine, no such disadvantages or uncertainties exist.

The facility with which this new material can be converted into different degrees of flexibility and hardness is not the least valuable of its properties; nay, it may be ranked among its most valuable, on account of its being the means of enabling it to be applied to a much greater variety of purposes than it would otherwise be. When its flexibility is desired to be increased, the preparations of pyroxyline are rendered more elastic by certain combinations with oils, solidified, or partly solidified, by the action of chloride of sulphur. This is dissolved in bisulphide of carbon, or mineral naphtha, the proportion suitable for the purpose being from *ten* to *fifteen per cent.* of chloride of sulphur to the cotton-seed, castor, or other oils. This produces a solid or semi-solid consistence, according as more or less of the chloride is used; so that the substantive condition of preparations of pyroxyline may be considerably modified, in order to suit special applications, by the use of resins, gums, tar, paraffine, stearine, glycerine, and other materials combined with them. The result of using a large proportion of the chloride is to solidify the oil, but about *fifteen per cent.* is sufficient to produce a tough, elastic substance. In proportion as the oils predominate, so is the flexibility of the material regulated. By applying camphor to the dissolved pyroxyline in varying proportions of from *two* to *twenty per cent.*, sheets of the material are produced with greater facility, and of more uniform texture. Similar objects are obtained by the use of gelatine dissolved in glacial acetic acid.

One of the most beautiful features connected with this invention is seen in the capacity which the dissolved pyroxyline possesses for the reception of colours. "The solvents used in the manufacture of Parkesine," observes its inventor, "are also good solvents of the aniline colours. This gives the great advantage of producing the most beautiful colours in a transparent substance, as well as in opaque or solid masses; and when these coloured articles are carved, the most exquisite effects are produced, imitating amber, malachite, and many other natural substances. Moreover, as the material can be moulded by pressure, the most beautiful works of art can be copied at a very small cost. For many large and cheap applications as much as *sixty per cent.* of pigments, sawdust, or cork-dust can be introduced with advantage, and thus is produced an exquisite and solid substance, very strong, and capable of being moulded and turned in a lathe, or rolled into sheets, at a cost exceedingly low."

We have already alluded to the economical price at which this material can be produced, and

which leads us to expect it to be employed in an infinite variety of ways in almost every condition of civilised life. Nay, it is not too much to expect to see even a copy of the first volume of the Working Man, bound in beautifully embossed covers of it, representing, with artistic precision, the various handicrafts of the artisans of England in a series of well-conceived designs executed in *basso relievo*. There is nothing extravagant in this expectation, for the material is capable of almost limitless application, whilst its adaptability for such a purpose may be considered as having already been proved. Some of the purposes for which it will be available are for spinners' rolls and bosses, for pressing rolls in dyeing and printing works, embossing rolls, knife-handles, combs, brush-backs, shoe-soles, whips, walking-sticks, floor-cloth, umbrella and parasol handles, buttons, brooches, buckles, pierced and inlaid work, tubes, bookbinding, chemical taps and pipes, photographic baths, battery cells, philosophical instruments, waterproof fabrics, sheets, and other articles for surgical purposes and works of art in general.

Another application of Parkesine promises to be of the utmost importance, and that is, to the insulation of telegraph wires. Into this portion of our subject, however, we will not at present enter, but may take it up at some future time, when the adaptability of the material for such a purpose has been thoroughly proved by the test of frequent and severe experiment.

LABOUR IN FACTORIES.

In the half-yearly reports, just published, of the Inspectors of Factories, we find Mr. Robert Baker speaking very strongly in favour of an enlarged application of the Factory Act Extension Act. Mr. Baker observes:—"It may be said, and will be urged, that additional hands on emergencies could never be obtained. My experience leads me to disbelieve in the word 'never' with respect to commercial operations. Even now, in most warehouses, additional hands are temporarily engaged on emergencies, and discharged on the emergency ceasing; and another kier or two for the bleacher, another roller for the printer, and a few more hands when needed, would obviate every difficulty. The main objection to the adoption of the Factories Act Extension Act, without the elective clause, is that in some localities from six to six is contrary to the conventional hours of work, and that before eight a.m. many household matters have to be transacted by the women. To this I reply that young mothers have no business to leave their families for the factory or the warehouse; but if it is really needful, they must be content with what they can do in reasonable hours to supplement the labour of their husbands and children. There can be no justice in debarring thousands of women of home knowledge at the close of day, for the few to whom early rising may be a grievance. Moreover, there is a silent and daily wrong accruing to any master who works his people after the sense of fatigue commences. No female, young person, or child ever worked with the same continuous energy through the night as through the day, even when the whole day has been passed in quietude. In the days when factories ran all night, I used professionally to call at the homes of the workers, to know whether they were in bed. But as closed eyes during day are the result of slumber only (not sleep), which is comparatively unrefreshing, so, on a visit to the works at midnight, during the 'dinner hour,' I have found many of the same operatives fast asleep till roused by the rumbling of the engine or the noise of the machinery in motion. I remember, too, on one occasion, having to put a bleacher under the Factory Act who worked exceedingly long hours, with all his workpeople, among whom were many little children. He was very angry, and at first put both me and the law at defiance. I recommended him, however, to take counsel's opinion and to be governed by it, which he did, and, finding he was wrong, became obedient, and, on a subsequent visit, said, 'Sir, you have been my best friend. I used to work from five in the morning till eleven at night, and I thought the Factory Act would ruin me; but now that you have compelled me to work from six to six with the same room, power, hands, and appliances, I get more work and better work out of the hands than I ever did, and I have not lost a customer.'"

What Shoeblacks can Earn.—The total earnings of the boys of the Islington and North London Shoeblack Brigade, in 1865, reached the sum of £951 15s. 10d., showing, at one penny a pair, a total of 228,430 pairs of boots cleaned, being an increase of £354 15s. 4d. over the earnings in 1864. The average weekly earnings have thus been £18 6s., and the daily earnings, £3 1s. The average number of boys daily employed throughout the year was 30½, each boy's average earnings being £31 3s. 11d. yearly, 11s. 11¾d. weekly, or within a fraction of 2s. a day.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

The only other case of partial failure that I shall refer to by name is that of the *Southampton Working Men's Halls*; and I mention their name, 1st, because the earnest and benevolent promoters have publicly expressed their own views on the matter, with which mine, for the most part, coincides; and, 2ndly, because they were commenced so brilliantly, and attracted such a large amount of attention, that, unless their want of greater success can be satisfactorily explained, the faith and zeal of many friends of the movement may be much impaired.

The first of these Halls was opened in September, 1862, just before our own society got under way. So great was its popularity, that the gentlemen who established it were led to open two others shortly afterwards. This they now consider to have been their *first* error, for there was not enough working power to conduct and control all three. None of us at first understood how much continuous work is required to make a club succeed; and although some of the gentlemen, and several of the working men who originated the halls, laboured most zealously, they were not adequately supported. They early saw, but not soon enough, that their *second* error was the universal mistake with regard to the age of admission. Lads and youths rushed in, monopolised the bagatelle-boards and other games, keeping the halls too often in a state of excitement and noise utterly subversive of a grown man's notion of comfort and relaxation. *Thirdly* must be ranked the absence of solid mental improvement. The halls were little more than mere recreation places; and hence no earnest growth of interest in the undertaking, nor gratitude for benefits conferred by it, continually added new recruits to the ranks of its devoted supporters. *Fourthly* must be noted the cardinal error of having merely Halls (places to go to) instead of Clubs (societies to belong to). On no point does experience, as well as broad views of the needs and tendencies of human nature, speak more plainly than as to the necessity of binding the members into a true and brotherly fellowship, if these clubs are to live and prosper. And, in the *last* place, the very serious but much less usual mistake was committed at the outset of the Southampton enterprise, of having a double committee system. A gentlemen's committee, appointed by the donors and honorary members, had supreme authority, and each hall had its own working men's committee acting in subordination. Now, it is quite right, of course, that when gentlemen give money to start a club, they should have some security for the due application of their funds; but if the clubs are to be supported by working men, *they must belong to and be managed by working men.* This is clearly one of the main and fundamental principles of the movement—one on which I have not yet had occasion to dwell, but on which it is impossible to lay too much emphasis. As a shrewd artisan observed at one of our conferences, "Working men have masters all day long, and they don't want 'em at night." I should think not. Change of attitude is indispensable, as necessary for growth as for comfort. Unless the club is really their own, of course, they will not go near it. But this does not imply that they object to fair and reasonable conditions of membership, or to being bound by two or three fundamental rules, or to persons appointed by those who find the money having authority to enforce such rules. All this is very different from having an irresponsible committee over their heads, with power to veto any of their proceedings. Hence we have always urged the appointment of trustees, in whom should not only be vested the property of the club purchased by donations, but who should have power to maintain the fundamental rules, to prevent the use of the club-house for improper purposes, and even to close it if the objects duly defined were not being carried out. Working men in most places, but at all events in Great Britain, are remarkable for their respect for law, and are especially used to the authority of trustees in many of their societies. Ample security is gained by this plan, without needless and ruinous interference, *or power of interference*, on the part of those who may be in a higher position, and who have contributed of their larger means to establish the club. We have given full information on the whole of this subject in one of the publications of the Working Men's Club and Institute Union.

But the friends at Southampton had to grope their way in this matter, and to buy their experience rather dearly. They offer it for the benefit of others, and say with us, Do not have a House of Lords and a House of Commons. Either unpleasant collisions will take place, or the independent working men will throw up their share in the business, and go their way. Generally the latter will be the result of those inevitable conflicts of opinion or action. The only possible exception may be found in the case of a club established and conducted in rooms forming part of church or chapel buildings, and where a very judicious committee of persons connected with the property *may* exercise the required control without collision or offence; but, at the best, it is a hazardous and, as I think, objectionable experiment. One great advantage of clubs is the opportunity and call they give for persons of different ranks cordially to work together; and while I strongly contend that it is a great benefit to the working men that they should have the advice and co-operation of two or three gentlemen (using the word in a very wide sense) in conducting their club, as all experience proves, I am quite sure that it is far better, as a general rule, they should sit in the same committee with the working men, and not have a separate committee of their own. They will always command sufficient influence if they are the right sort of men; and if they are in a very small minority, and are at the same time impressed with a conviction of the importance of leaving the working men sufficiently to themselves, there would be no danger of their having undue weight in the committee.

In five clubs this plan of a double committee has been tried, and it has been fatal to four of them. The fifth case is of the exceptional character above referred to, the club being held in rooms under the school-rooms adjoining a large district church, and it has not been very long in operation. It may possibly work well there, *i.e.*, not be positively injurious. But under the most advantageous circumstances I should still believe it would be better that two or three of the gentlemen should sit on the working men's committee *rather* than in a separate committee of their own. If, however, the property belongs entirely to the working men, and they alone are answerable for the rent; or if the gentlemen to whom the said property belongs, and who guarantee the rent, are not willing to have any share in the management beyond seeing that fundamental rules are observed, then they had better occupy, as before said, the position of trustees. This is, practically, the plan of administration in the Duck Lane Club, where the committee has always been composed exclusively of the labouring classes, but where Miss Cooper has been the ultimate depositary of power and court of appeal.

Two out of the three original Workmen's Halls at Southampton have always preserved a small but vigorous element of life; and after reaching the lowest stage of exhaustion, the surviving members, with true British pluck, willingly accepted the responsibility offered them of taking the management entirely into their own hands, and last year entered on a new and independent career, though, of course, in a very humble way, compared with their former commencement. They have still had the valuable advice and influence of the Messrs. Westlakes, and are working along in a thoroughly sound and, so far, satisfactory manner. A coal club, formed by the Winchester Terrace Club (late Orchard Street), has been eminently successful, and a considerable help to the club in several ways. It numbers 480 members. The parent club itself has about 72 regular members, with about 20 occasional ditto. The other club, at Northam, suffered much, not only formerly, from dissensions between its own committee and the gentlemen's committee, but even since being placed on an independent basis, from the conduct of its late secretary. Its last return, however, shows about 77 members, and it is about two-thirds self-supporting, with a rent of £20. The other club is quite so, but has only two rooms at present, at a rental of £10.

There is another small hall at Portswood, in the same town, more recently established, from which I have not yet received any returns, but I believe it is leading an humble and useful existence.

MONEY PRIZES,
TO BE COMPETED FOR BY
WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

Parliamentary Manners.

The best artists sometimes make mistakes, and throw into their compositions an unhappy dash of colour, which destroys the entire harmony; and makes critics say they have not learned the "secret of tone." Perhaps the objectionable streak is a mere whim—perhaps an experiment—possibly a deliberate act of judgment—but an error all the same; and almost every one who looks upon the picture thinks so. The Right Hon. Robert Lowe, who is a great artist in speeches, committed this fault in his late oration against Reform. In the foreground of his canvas, he put in the working classes, in colours rather too dark, tinged by rays equally too lurid. This was an error in art. It spoilt the otherwise brilliant effects which the great word-painter aimed at producing. Such a disparagement of the working class was felt to be a fault of taste, not to say an offence. True, the working class are not perfect—we should like to know what class is. No doubt the great working class includes numbers whose habits admit of improvement; but, as a body, they possess very many undeniable claims to political recognition. Mr. Lowe's method of argument would require a personal comparison of the habits of classes to answer it. Now, class personalities, we take it, would be as offensive, improper, and unparliamentary as any other personalities; and we think that Mr. Speaker, on his return to his chair, would do well to rule so.

On the last night of Parliament before the Easter recess, this question of personal imputation received memorable notice from the Chancellor of the Exchequer. Lord Robert Montagu spoke of Mr. Villiers, the President of the Poor Law Board, as "*pretending* to be the friend of the working man." Mr. Gladstone, when he rose, called Lord Robert to order; and, on his lordship adhering to the phrase, Mr. Gladstone said that, "in his opinion, the working men, if admitted within those walls, would set the noble lord an example of courtesy—an example of good breeding—an example of high breeding which he might do well to follow." This was a vindication of the manners of working men which we hope they will always deserve. It is a rule of the House of Commons that no personal imputation of insincerity, unveracity, meanness, or dishonourable motive, shall be made. Each member is expected to give others the same credit for good faith, high feeling, and good intention as he claims for himself. And if any member, in the heat of debate or otherwise, transgresses this rule, he is instantly called to order; and, on being made aware of the sense in which his words are regarded, he is expected to recall them, or disavow the offensive sense imputed to them. If he refuses or evades doing so, he incurs loss of character, and the extreme displeasure of the Chair. This rule preserves the high character of Parliament as an assembly of gentlemen of good manners; and, in this respect, it is as easy for a society of working men to be gentlemen as though they wore fine cloth and had large rent-rolls. It merely requires self-respect and careful consideration for the character and feelings of others. Many persons cannot see how they can argue at all unless they can be disagreeable, and make personal imputations on others. The law of debate is this: a member of Parliament may find fault with the wisdom of another member; he may convict him of error, of partial views, of advocating injurious measures, of saying (unconsciously) unfounded things. He may do this without personal offence, because no man is all-knowing, all-seeing, or infallible, and no man pretends to be so. But every man ought to be honest, and truthful, and well-meaning. Every man assumes to be so; and his self-respect forbids him to sit still and hear himself charged with want of faith, or truth, or right feeling. And no gentleman ever makes these imputations, since debate can be conducted better without them. The truth can be ascertained quite well by discussing the nature, bearings, and facts of any measure. This was the ground of Mr. Gladstone's remonstrance to Lord Robert Montagu. As leader of the House of Commons, Mr. Gladstone is responsible for the honour and character of Parliament.

It was after the words we have just noticed that the noblest vindication of the working class made in Parliament occurred. Alluding to the sudden and protracted cry for statistics for the first time set up in the House of Commons, Mr. Gladstone, whose manner and tone on the Friday night in question betrayed the return of his wonted fire, exclaimed—"Honourable members seem as if they were engaged in ascertaining the numbers of an invading army; but the persons to whom their remarks apply are our fellow-subjects, our fellow-Christians, our own flesh and blood, who have been lauded to the skies for their good conduct—men who have borne destitution and starvation in a manner which might be a lesson to all of us."

This, it must be owned, is a generous and ample answer to Mr. Lowe's and Mr. Horsman's imputations. The working class are, we are glad to think, grown robust-minded, and do not care to resent ungenerous or disparaging things said of them. We are glad to see that they mostly pass them by in dignified silence. But since there might be those in Parliament who would believe assertions made by eminent speakers to the detriment of the people, it is well that such remarks there should be answered in the same place; and when they are answered by one so high in authority and knowledge as Mr. Gladstone, there is an end of them, and the just character of the working class is established on a better foundation than ever. The working man owes Mr. Gladstone gratitude for this generous vindication of his order.

Franchise Correspondence.

We mentioned, in a recent number, that "opinions were wanted in Parliament," and for several weeks past have had the satisfaction of publishing a series of letters, in reply and in reference to Mr. Clay's Bill, which throw a curious and interesting light upon the reception likely to be accorded to it. The letters are as genuine as they are spontaneous, and written with a degree of relevance, readiness, and even felicity of expression, which do great credit to the writers. We have no doubt they will be read by many members of Parliament with considerable attention.

Just as the Statistical Society may discuss the number or relations of electors to the population of any given country, without entering into the political functions of electors; just as the British Association for the Advancement of Science may discuss the principle and methods of representation, quite apart from its political bearings, so we propose in these pages to restrict ourselves to the elementary, distinctive, and uncontroversial aspect of the franchise question. We take the industrial, not the partisan or political side of it. On what side working men may use their votes, is no question of ours. On this subject we have nothing whatever to say. We neither advise, nor suggest, nor indicate, nor approve, nor condemn. But whether working men shall be admitted to the franchise or not—whether they shall be elevated in the scale of citizenship—that is a question on which we may have an opinion—at least, we may properly record opinions upon the subject, and explain any steps taken by friends of the working class in Parliament towards this object; and when a method of enfranchisement is proposed, as in the case of Mr. Clay's Bill, which makes intelligence a political necessity in England, that strikes us as a very important thing. It affects working-class interests. Intelligence, all the world knows now, is power; and to make intelligence a political necessity in England is to confer personal power, whether it confers political power or not. A proposition so new as never to have been made before—a proposition such as Mr. Clay's, which, for the first time in the history of the world, proposed to enfranchise the intellect of the common people, and to regard understanding as a civil and political qualification—deserves support alike for its wholesomeness, its intrepidity, and its generosity.

It would be greatly to the credit of the people if they should show to Parliament that they were interested in the principle of such a measure. It is a matter of congratulation that so many of our readers have already commenced to give their opinions. Mr. Glazier, who must have had thoughtful experience of public questions, states very truly that there must be advocacy and exposition for a long time continued before any extensive response can be expected, even to an excellent proposal. It takes a long time to make a thing known, longer to get it understood, and repeated expositions to awaken interest in it. But this is one of those questions upon which interest, once awakened, will not soon subside. The Government appear to have left a door open for Mr. Clay's Bill, by choosing a £7 instead of a £6 franchise. Those they exclude they possibly fear, or their opponents do; but no one fears the intelligent. There is great pressure,

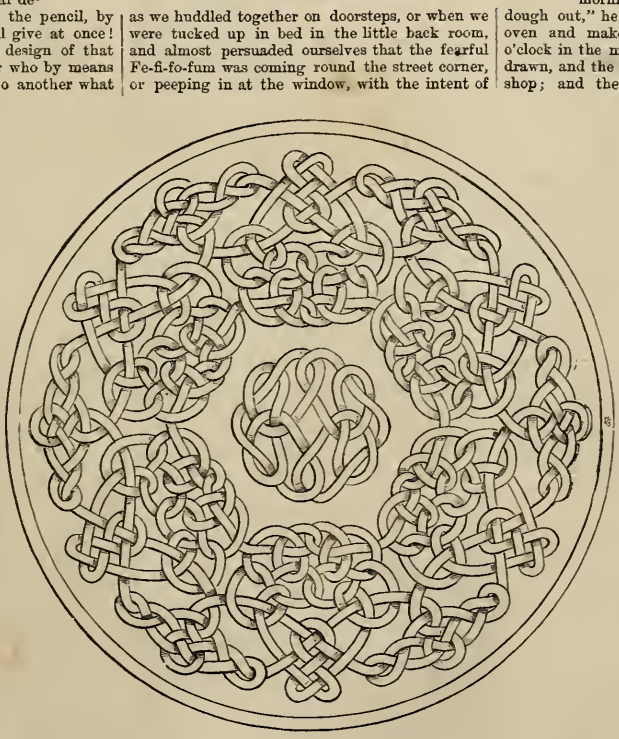
apparently, being put upon the Government to settle the Franchise question, and bring forward a complete measure. Mr. Clay's and Mr. Gregory's Bill would settle it. There would be no further agitation for a Reform Bill. The agitators could never more make way so long as they were ignorant, and as soon as they became intelligent they would, under Mr. Clay's Bill, be absorbed in the enfranchised, and their complaints would be at an end. A more wise, prudent, peaceable, far-seeing, conclusive, and honourable measure of enfranchisement, has never been devised than the Bill of the honourable members for Hull and Galway.

Art Designs

FOR USE IN TRADES AND MANUFACTURES.

CIRCULAR DESIGNS.

The other day, in an ably reasoned and eloquent address to working men, on the advantage of a knowledge of ornamental art, the speaker truthfully observed, "We are all aware of the advantages derived from having a knowledge of drawing, even in its simplest form. How impossible it is to convey a clear impression of an object to the mind of another by a mere verbal description, which a few strokes of the pencil, by a moderately instructed hand, will give at once! The workman who can sketch a design of that which he desires to undertake, or who by means of lines and curves can explain to another what he suggests, at once feels the great advantage such knowledge is to him, and should we follow through this the higher branches of the art, what a delight it is to carry away nature's beauties and wonders, and pass again over the well remembered scenes, with other companions, when transferred to canvas! An artist," he continued, "may be labouring truly in his vocation when designing even such common things as a teapot or a water jug—articles in daily use—and thus may raise the taste for use in the million, and do more for the general benefit of his countrymen than by an elaborate work worth thousands of pounds." A knowledge of drawing is to design what a knowledge of spelling is to literary composition. To be a good designer, one must be able to draw well. The accompanying designs, drawn on a greatly enlarged scale, will afford a good field for practice, and, perhaps, in some instances, prove the means of eliciting some new features from the pencil of the student. It will be perceived that in both instances, the perfect design is formed by a repetition of parts, fitting into one harmonious whole; although, in the second illustration, the centre portion of the design has been so contrived as to remove the idea of repetition.



Grind His Bones to Make my Bread.

In my young days I remember to have experienced unpleasant sensations arising from a couplet, supposed to have been uttered by a very terrible giant, who, having smelt the blood of an Englishman, shouted—

> "Whether he be alive, or whether he be dead,
> I'll grind his bones to make my bread."

I cannot say, so far as I was concerned, that it was a nursery legend, because I was not brought up in a regular nursery, but in a higgeldy-piggeldy fashion, with those who were older and bigger than myself; but I have heard old folks tell the story to us little ones, and we used to talk it over as we huddled together on doorsteps, or when we were tucked up in bed in the little back room, and almost persuaded ourselves that the fearful Fe-fi-fo-fum was coming round the street corner, or peeping in at the window, with the intent of packing us up in sacks and trotting off with us to his mill and bakery.

Well, I have just been reading the newspaper, and it seems to me that Fe-fi-fo-fum, the giant, is a symbol of easy-going, well-to-do, hot rolls and new bread living folks, and that the "Englishman" who was to be so summarily ground to powder for the morning meal, is neither more nor less than the poor journeyman baker, whose life is ground out of him by hard work; who, at an age when other working men are in the prime of their health and strength, is a decrepid man, and whom consumption and innumerable other ills, like the poet's Melancholy, "mark for their own."

I declare seriously that since I read that report of the inquest on George Spriggs, aged fifty-four years, who died the other day in a bakehouse in Cowcross Street, I have felt rather uncomfortable at the sight of a quartern loaf. I know that our daily bread often contains queer substances—some people say bone-dust—such as alum and potatoes—indeed, I have seen potato-peel, too; and I knew a person who returned a large piece to the baker, with his compliments, and a request that the potatoes might be peeled in future; but now I fancy that some portion of a human being's life has been by some strange process transferred to the loaf, and that which is truly the staff of life to us has been in a certain degree the weapon which caused his death. I know such ideas savour strongly of nonsense; but the imagination is excited when the feelings are roused, and I confess to labouring under no slight amount of indignation.

Here, in brief, is the story of the daily working life and the sad death of George Spriggs, journeyman baker, one of many thousands similarly situated, who in every district of London are wearing out their lives in a systematic slavery, which for real hardship can scarcely be surpassed. At five o'clock every afternoon Spriggs left his home to go to the bakehouse. Arrived there, he set the "sponge," then attended to "little odd jobs;" then made the dough; then heated the oven and attended to it until three o'clock in the morning, when, having "thrown the dough out," he helped his master to set it in the oven and make the bread. By eight or nine o'clock in the morning the bread was baked and drawn, and the rolls made and carried up to the shop; and then Spriggs, having been hard at work for about sixteen hours, had breakfast. I hope he had an appetite for it; but I do not think I could eat a bit if I had been shut up for half the time in a hot, close bakehouse, in the stifling atmosphere caused by hot bread. Sixteen hours is a tolerably long spell of work, even for a man who has a vigorous appetite for labour. Certainly he had been at liberty to lie down for a short time while the oven was getting hot, and we must deduct that interval of refreshing sleep on a sack in the corner of the bakehouse, with the black-beetles running over him, from the length of time he had been at work. Still, even after that important deduction he had well earned his breakfast, and then, one may suppose, set off home to enjoy a good sleep, even though it were in the day time, when sleep, I have always found, does not seem wholesome and invigorating.

But Spriggs did not go home then. He had just a little more to do first, and that was to go out to the customers with the bread he had made during the night. I have not the slightest idea of the weight of a baker's basket full of bread; but I know it is something considerable — a great deal more than most persons would care to carry about on their shoulders on a hot day, and, most likely, having been up all night, and having swollen, tender feet, help to make it appear a trifle heavier than it really is. A large barrow, too, filled with bread, is not a slight weight to wheel about; yet, with basket or with barrow, George Spriggs had to make his rounds, be the weather hot or cold, wet or dry. He had to run up and down steps, to be civil to customers, to take money, and make entries in the books of those who ran weekly accounts. For three or four hours he was thus engaged, and then his work was done, and he went home, reaching there by two o'clock in the afternoon. Only twenty-one hours of work out of the twenty-four,

and the same to-morrow, and the day after! He did not attempt to undress when he got home, but lay down in his clothes for the three hours at his disposal. There's a life for a working man! One morning, Spriggs, after he had called his master, complained of feeling ill, sank down among the dough, and said, "Oh, my poor head!" He was laid tenderly enough on some sacks, and his mistress made him some tea; but his eyes glared strangely, his head fell listlessly, and a cold sweat stood in damp beads on his face. A doctor was sent for, but did not come; then the poor journeyman baker was lifted up, and carried to the hospital, a few yards away, and there the bearers found that the pulse was stilled, and that death had brought rest at last. He died from apoplexy—so the doctor said—and to that effect the jury returned a verdict.

"My customers will have rolls and new bread, and bakers must work all night," said the master baker at the inquest. He tried once to do without night work, and found he must also do without business. No hot rolls or new bread, and no customers; that was the result. So the man who makes the soft, warm delicacies must be killed in the work, as Strasbourg geese are slowly tortured, that patties made of their fat livers may be toothsome.

"Why does not the Legislature interfere and forbid night work in bakehouses?" asked the master. The Legislature has interfered to some extent, and might, perhaps, do more than it has done; but the root of the evil lies where Acts of Parliament cannot well reach it. There might be night work and new bread, too, and yet nobody be over-worked, if the masters chose, or if the men were as resolute as the men in other trades are. But, I suppose, the heart is well nigh like out of them, and no wonder. But this I say—and, as a skilled workman myself, I say it confidently—that it is a violation of right reasoning and justice to combine the work of a skilled workman and a mere porter in the same man. A man who can make bread is skilled in an art which he had to learn and to pay for learning, either in money or time. It is unjust and cruel to force the bread-maker to be the bread-carrier also. Two men would do the work better, and neither be over-worked. When the batch is drawn from the oven, the work of the baker is done, and he ought to go home, having, indeed, finished a good night's work. Then a carrier should be employed to supply the shop with the batches, and to serve the customers out of doors. An active man, fresh to his work, would be worth two poor, weakly fellows, emaciated by over-work, and with feet swollen by the heat of the bakehouse and want of rest.

I say it in all seriousness, that the story of the death of George Spriggs is one of the saddest tragedies I have lately read. If such things are really unavoidable under the present system, things must be bad indeed; but, as I have said, I believe a change is quite possible, and that the giant who loves hot rolls may still enjoy them without any George Spriggs being ground to make the bread.

*How the Rate of Wages may be Raised.**

BY ARTHUR HOUSTON, M.A.,

Whately Professor of Political Economy in the University of Dublin.

From what was said in the article on wages immediately preceding, which will be found on page 183, the reader will have understood that efforts to raise the value of labour should, as far as possible, be made by acting either on the demand—that is, the capital of the country—or on the supply—that is, the number of labourers, the duration of their work, or the amount of exertion put forth by each of them in a given time. If the demand be augmented, or the supply diminished, or if the former be increased in a greater ratio or diminished in a less ratio than the latter, the value of labour will inevitably rise.

It remains, then, for us to consider how this alteration in the relation of the two things to each other can be effected.

It might appear as if the working classes could do nothing to promote the increase of capital, since that lies in the power of capitalists alone, whose conduct, as regards saving and accumulating, will be governed entirely by an intelligent self-interest, the dictates of which it needs no representations on the part of their work-people, or any one else, to urge them to follow. But this inability of the working classes to promote the increase of capital, exists only so long as labourers and capitalists form two distinct sections of the community. The moment that the labourer himself begins to save for purposes of investment, and thus becomes, in however small a degree, a capitalist, his accumulations begin to tell upon the rate of wages. He may not, indeed, be able to perceive its action upon his own wages—no labourer or class of labourers may, in fact, be conscious of any effect produced on the rate of their remuneration; nevertheless, it is almost as certain as anything can be, that the influence has been exerted somewhere or other. Suppose the labourer has deposited his savings in a bank: the profit of a bank is made principally by lending a portion of its deposits to capitalists, who, of course, expend in wages a part of the advances thus made to them. If it should happen that the money saved by the labourer was placed in one of the Post Office Savings Banks, the effect would be much the same. Such a mode of investment is, in reality, but lending to the State, and the more the State borrows from the working classes, the less will it require to borrow from others; but other classes have money to lend, and will look out for borrowers. Those they will find in the ordinary banks of deposit, which, in turn, will lend the money so received to capitalists, and thus increase the amount the latter have to spend in wages.

There is, indeed, one way in which the working classes may more directly and immediately, though not, perhaps, more certainly, raise the rate of wages, and that is by saving, and investing their savings in Co-operative manufactories. It would be a digression to enlarge here upon the advantages of this new system of industry, but in any enumeration of these it is well that the influence of Co-operation in augmenting the earnings of the working classes themselves should not be left out of sight. Co-operation in this respect is "twice blessed." It benefits the co-operator who furnishes the capital, by giving him a much larger profit on his savings than the interest any bank could possibly afford; and it benefits the mere labourer by augmenting the fund from which his remuneration is drawn, and thus increasing the share which he individually receives.

The amount of good which the working classes might do themselves in this way is almost beyond calculation. They annually spend millions upon millions, which, by the exercise of a little care and foresight, they could save, without trenching in the least upon their real comforts and legitimate enjoyments. It would be a low estimate to place the amount they could thus lay by at one-twentieth of their income; and what an addition to the wages fund of the country would this make in a few years! This is a view of the question of saving *versus* spending which is well worth impressing on the minds of all classes. Those who spend, and especially those who spend more than they can afford, get the credit of being open-hearted and generous, while those who save are too often set down as niggardly and selfish. But saving is often the truest generosity; for it enables him who saves to be generous to those who have the strongest claim upon him: and prodigality is generally the offspring of the purest selfishness—a selfishness which prefers the gratification of a passing whim and the good opinion of worthless companions, to the abiding satisfaction that arises from a sense of independence, and the gratitude and affection of those whom ties of kindred or friendship bind us to cherish and support. But saving in a working man is deserving of commendation on this additional ground, besides those which exist in the case of persons belonging to a different rank—every shilling he puts by adds to the earnings of the class of which he is a member, and to which his first duty is owed. The prudent workman is not only fulfilling his obligations to himself, his family, and his friends, but to his order, and thus deserves the esteem of every one who can distinguish between sterling generosity and that spurious article which so often assumes its name and garb.

At the present day, too, a peculiar reason exists why the growth of capital should be encouraged in every possible way, and why the working man, therefore, should bear his share in contributing to its increase. The rapid accumulation of capital that for the last half century has been going on in Great Britain is the principal cause of the comparatively high rate of wages received by the British operative. The supply of labour has so largely augmented during that period that, but for the extraordinary increase in the demand, its value must inevitably have sunk to a very low level. Now, hitherto the capital thus accumulated sought an investment at home, and only to a very limited extent ventured into other countries. The instability and dishonesty of foreign governments, and the insecurity of investments made in places where the capitalist could not personally superintend the undertakings in which his capital was sunk, and where the principles of trade were but ill understood, rendered British speculators very reluctant to trust their capital beyond the shores of their own country. But, from circumstances which need not here be further alluded to, their confidence in foreign investments has, of late years, been much increased, and hence a great deal of capital, which formerly would have been invested at home at a moderate rate of interest, is tempted abroad by the high rate of profit that can be realised there. A very large proportion of the accumulations going on here is thus carried off, and in this state of things it would be unsafe to calculate upon any great increase in the rate of wages arising from the growth of capital in the hands of large capitalists, who will probably, year by year, embark more and more of their funds in foreign speculations. It is thus, then, that it becomes doubly important that the working men themselves should endeavour to supply the deficiency which this foreign drain will necessarily create.

* Continued from page 183.

The French Working Man and his Home.

M. Jules Simon, one of the most distinguished members of the French Legislative body, has just published a work entitled "Le Travail," in which are to be found many interesting details respecting the present condition of the working classes in France. In his preface he says:—"I wish to pronounce the eulogy of labour, and of those who labour. I desire to show that intellectual labour and manual labour are nearly related; that labour and capital have the same origin and the same rights; that the capitalist of to-day is the working man of yesterday; that the working man of to-day is the capitalist of to-morrow; that many disputes arise from a misunderstanding; that it often suffices for the solution of a problem to clearly comprehend the terms of it, and for the reconciliation of adversaries to bring them together and to teach them to know each other." In a chapter on "Building Societies" he contends that the best means of putting down the *cabaret*, which, by common consent, is the great enemy of all material and moral progress, is to make the home comfortable. After describing the pernicious influence of the *cabaret*—the public-house of the Frenchman—and the prevalence of intemperate habits amongst French working men, he proceeds to notice the efforts made by the Co-operative Associations in England, Germany, and France for the improvement of the habitations of the poor. London, he says, is of all places in the world the city where most has been done in this way:—"It, indeed, wanted it, and will want it more for a long time to come; for in a city so immense, containing a floating population so numerous, many years will pass before anything like complete reform can be effected." He admits that, in spite of many difficulties, a great deal has been done in England, and expresses his opinion that French architects and promoters of associations for the improvement of workmen's dwellings, would learn much from it. One thing in particular, according to him, is deserving of imitation—namely, that water is carried into all the rooms; "and," he adds, "cleanliness becomes gradually a habit, and very soon a necessity. With us, on the contrary, water, and consequently cleanliness, is an object of luxury."

Some years since France began to enter on the work of reform. The great piles of buildings known as "*cités ouvrières*," constructed previous

to 1850, were a failure; and not more than five or six of these barrack-like edifices found favour with the working classes. This mistake has been rectified, and instead of endeavouring to bring large numbers of families together in these buildings, it is sought to keep them apart, and this, in M. Simon's opinion, is an important step, as it favours individual liberty. He decidedly gives a preference to the plans carried out by the Mulhouse Association, which was formed in 1853, with a capital of 300,000f. in 60 shares of 5,000f. each.

In our first number we alluded to this association, and described the working men's towns on the Upper Rhine, of which it had become the parent. According to M. Simon, the good effected by such associations has been very great. He says:—"The success is complete, both in a material and moral point of view. Public-houses deserted, family affection revived, the public health improved, prove beyond doubt that, of all the means of being useful, the founders of the Mulhouse Association have chosen by far the best. The operation of the societies may be thus summed up: The houses cost nothing to those who sell them, as their advances, capital and interest, are refunded; and they cost nothing to those who buy them, because they pay for them with the rent they would have to pay in any case for houses less commodious. On either side it is impossible to do better at less cost."

Things Talked About.

The *Times* has just discovered that working men are a much more important body in the State than it had previously suspected. The electoral statistics on which the new Reform Bill is founded show, that the direct influence of the working classes in legislation is greater than even those who had the credit of best understanding the subject had surmised; and now the *Times* finds out that the indirect influence is so great, that working men are comparatively indifferent to any considerable extension of the franchise, knowing that the control of those matters which are of most immediate practical benefit to them is virtually in their own hands. The leading journal has devoted two leaders to the consideration of the Sixth Annual Report of the Amalgamated Society of Carpenters and Joiners, and is amazed at the results achieved, and the powers of organisation exhibited by men who are only day workers at mechanical trades. Mr. Mill, says the *Times*, was "right when he concluded that they (the working classes) needed no artificial protection at the hands of the Legislature. They understand, apparently, the value of organisation better than any other class, and have become adepts in maintaining it." The *Times* is almost dismayed when it dreams that a society, which has only been established six years, has nearly 6,000 members, and an annual income of £10,000; that it has branches in ninety-four towns, and that in fifty-two of that number a permanent advance in the rate of wages has been obtained by the action of the society, and in thirty towns a reduction in the hours of labour. It is noteworthy that these successes of combination have made questions of abstract politics less captivating to the thinking portion of the working classes. It has been often observed that seasons of distress are the seasons of political disturbances; and the reason is that, unable to help themselves, working men have looked for relief in merely political changes. When they feel they can help themselves they trust to themselves, and care little for theories. The *Times* is not far wide of the mark when it says:—"The whole truth of the matter is that the Trade Societies are now real Political Unions of the completest kind, only addressed directly to the regulation of those particular politics which their members have most at heart. The working classes know full well that the questions in which they are most interested concern the rate of the workman's wage and the length of his working day. They well understand, and, indeed, are not slow to affirm, that no reform which the most revolutionary demagogue could promise them would ever make itself felt like a shilling a day added to pay or an hour struck off from time." Yet this very power of managing their own affairs well—the practical application of the ability to organise, to maintain the position of the State—is the very reason why they should be admitted to the more direct political privileges they have so well earned.

Especially is this the case when, as in the case of the carpenters and joiners, they add to intelligence firmness and power of amalgamating discordant elements into a systematic whole, good temper, and a conciliatory spirit. It is pleasant to read, in the report, of the "codes of peace," as the secretary names the working rules mutually agreed to by, and equally binding on, employer and employed, and which, says Mr. Applegarth, the secretary, "I trust ere long to see adopted in every town in the kingdom, so that the general public may judge for themselves who are the aggressors in these social conflicts, and go far to prevent that which we have experienced and regretted in the past."

There has been a meeting at Blackheath to consider the present condition of the open spaces in the neighbourhood; and a committee was formed to act with the Commons' Preservation Society. The public are now disposed to act for themselves, and to compel Government to adopt measures which, had they been properly enforced years ago, would have saved many a bright spot for the general enjoyment. Greedy neighbours have filched thousands of acres from the common lands; and, unless we would have all our play-places overrun with bricks and mortar, we must bestir ourselves. Already there are signs of resistance to protective action. The parish of Lewisham denies common rights to 157 acres of Blackheath which have been hitherto open to all; the lord of the manor of Plumstead claims 154 acres in that district; Peckham Rye Common is also claimed by the lord of the manor; of Morden Common, Surrey, more than 80 acres have been recently enclosed; Tooting Common (63 acres) is in dispute between the overseers of the poor and the public; public rights over 60 acres of Mill Green Common are denied; and the same denial is given to the free character of 300 acres of Epsom Common. In Epping Forest nearly 150 acres have been enclosed in the manor of Higham Bemstead, "without any Act of Parliament, and without making any provision or compensation for the rights of the commoners or public." We need not, in this place, add to the catalogue. Enough is shown to prove the necessity of prompt action.

The last report of Mr. A. Redgrave, one of the factory inspectors, on the operation of the Factories' Act Extension Act, 1864, is very interesting. It especially refers to the children employed in the laborious occupation of fustian-cutting. One large Manchester firm wrote to the sub-inspector:—"The inconveniences we expected to arise from the introduction of the Factory Acts into our branch of manufacture, I am happy to say, have not arisen. We do not find the production at all interfered with. In short, we produce more in the same time, as the young folks are not so wearied out, as formerly, with the long hours." Another employer says:—"I am quite certain that the Act has raised the character of the trade. I would not have old times again. I have been kept until ten or half-past ten o'clock of an evening formerly waiting for one or two cutters. The hands do not come early to work of a morning in consequence of there being no united action amongst the employers; and I am sure the hands would be happier and more content if punctuality could be enforced. The hands are more united now than they were formerly. All the children in the village used to be put to cutting in preference to nursing, as they could get a little more money, and the cause of the low prices formerly was the number of children employed in the trade." So far, then, as the employers are directly concerned, the benefit of the new Act is obvious; but a contingent evil must be guarded against. Mr. Redgrave says:—"I cannot report, therefore, that the first effect of the Act has been to increase the number of school children; for, there being so many unrestricted labours, the children could find work immediately at a higher remuneration, but necessarily for longer hours, in such works. If the works affected by the Act of 1864 had been those in which restrictions were manifestly more needed than in any other, the masters would not have as much reason to complain of the very injurious effect the new regulations have had in driving from their works the youngest children to other and not less injurious works. It appears to me that this is a very strong reason why Parliament should consider, at an early period, the condition of other occupations in which young children are employed."

Once more the Spitalfields weavers are calling public attention to their distressed condition. One speaker, at a recent meeting, said that, in consequence of the low prices paid for work, 10s. a week was the utmost that could be earned, even by working fourteen or fifteen hours a day. Of course, there are two sides to every question; and we are, therefore, not surprised to find an employer writing to the public press to say that, even at the least remunerative work, a fair hand, working twelve hours a day, can make 15s. 9d. a week; at better work, £1 a week; at moire antiques, £1 10s.; and that first-rate hands may make sure of £1 15s. or £2 a week. Besides, almost every member of a family may work, and so add considerably to the amount earned. In a future number we hope to give an article throwing some light on these contrary statements. It is very singular, as showing the fluctuation of wages in different parts of the kingdom, that it is authoritatively stated that Spitalfields weavers, migrating to Lancashire, might make sure of at least double the wages they are now earning. That is rather an awkward nut for economical theorists to crack.

The New South Wales journals afford interesting instances of the growth of manufacture at the Antipodes. There seems to be an apparently inexhaustible supply of iron ore and anthracite coal; and a company formed by the union of two large firms are making arrangements for business on the largest scale. As a Sydney newspaper truly remarks, "It will be a great day for the colony when we can make our own rails, and can supply all the heavy iron-work necessary for our various public works and our great manufacturing districts." The Queensland *Daily Guardian* congratulates the colony on the appearance in the market of the first lot of Queensland sugar, which is described as "an event in our commercial affairs, and one from which, we believe, will date a great future trade."

We read, too, of the inauguration of a large boat factory at Glen Rock, Waverley, New South Wales. The proprietor, Mr. Vickery, is evidently a far-seeing man, and sees for the Australian colonies a great destiny which they may work out:—"He trusted that he and those he saw around him might be long engaged together in the work of producing colonial manufactures. This was one of those things that must be attended to if the colony was ever to progress. When he looked about him and saw so large a number of children, he felt that something ought to be done towards finding occupation for them. They could not all be shepherds or gold-diggers; some might not be strong enough for these employments, and some better occupation might be found for them than that of being buried in the bush. He thought it was high time that the colonists generally turned their attention to the management of their manufactures."

The King of Portugal has conferred a patent of nobility on an Englishman, Mr. James Mason, the proprietor of the famous copper and sulphur mines of San Domingos, where a mining colony of more than 3,000 inhabitants is now established, and which exports annually upwards of 150,000 tons of pyrites to England.

We are happy to announce that the great strike of Cornish and Devonshire miners is at an end. The men have resumed work, although the grievances they complained of have not been redressed in the way they desired; but they feel that, the matters in dispute having been prominently brought before the public, redress may be hoped for. At present, it seems, the amount of support which the proposed Miners' Association would receive is somewhat doubtful.

Mr. Dayman, the magistrate of the Wandsworth Police Court, has defined the meaning of a handicraftsman. The South Western Railway Company summoned a fireman for absenting himself from work without permission. The summons was taken out under the Masters' and Servants' Act, but the magistrate dismissed it, as he "doubted whether the driver or fireman of an engine came within any of the descriptions mentioned in the Act of Parliament. The only exception which he could find was in the case of husbandry, and that was work for the manufacture of food. There must be something manufactured to bring the case within the meaning of the word handicraftsman. For instance, a coachman in the olden time was not brought under the Act, though it required great skill to be a coachman, but yet he was not a handicraftsman."

Two companies for the provision of dwellings for the labouring classes are now before the public. One, the Suburban Village and General Dwellings Company, has secured a site of ten acres on the London, Chatham, and Dover line, and special railway privileges will be afforded. The other, the Operatives' House-building Company, contemplates the erection of blocks of buildings on the most approved principle in densely-populated thoroughfares, the occupants of the houses being themselves the shareholders of the company, and paying by instalments of 6d. a week.

COTTON SPINNING.

Whirring, whizzing, fly, ye spindles,
Under steam's unwearied hand;
Who shall say for what ye labour,
Or for whom throughout the land?

Weave ye now the swaddling wrapper,
Or the corpse's winding-sheet,
Bridal hangings, or the trapping
For the house of sorrow meet?

Often other than we reckoned
Comes to pass the full event;
Oft, in answer to our hoping,
What we feared by God is sent.

Whirring, whizzing, fly ye spindles,
Swiftly at your lord's behest;
Man proposes, God disposes—
And whatever is, is best. G. E. M.

In Paris the average sale per week of eyes intended for the human head amounts to 400. One of the leading oculists "receives" in a magnificent saloon, resplendent with gilding and mirrors.

Spanish Proverbs.—Water that has run by will turn no mill. Love, a horse, and money, carry a man through the world. Three things kill a man: a hot sun, supper, and trouble. To shave an ass is a waste of lather. If the gossip is not in her own house, she is in somebody else's. Don't speak ill of the year till it is over. The mother-in-law forgets she was once a daughter-in-law. A mewing cat is no monser. Men are as grateful for kind deeds as the sea is when you fling it a cup of water.

Co-operative Intelligence.

Rothwell (Northamptonshire) Co-operative Society.—According to the twenty-first quarterly report of this association, it is progressing very favourably. The business done during the quarter was £475 16s., being an increase over the previous quarter of £20 6s., and which, after paying wages and expenses of management, gave a net profit of £39 13s. The business done during the past year has been £1,694 6s. 3d., against £1,267 9s. 8d. the year previous, showing an increase of business of £426 16s. 7d., which, after paying wages and expenses of management, gave a net profit of £144 17s. 8d., which has been disposed of as follows:—£17 3s. interest, at 5 per cent. per annum; £108 5s. 6d. dividend on members' purchases, and £2 17s. 3d. on non-members' ditto; leaving a balance of £16 11s. 11d., which has been made over to the reserve fund.

Husband's Bosworth Industrial and Provident Society.—The seventh quarterly report of this society shows that the business transacted at the store during the past quarter amounted to £267 19s. 2d., of which sum £160 0s. 11d. was laid out by members, and £107 18s. 3d. by non-members. The balance-sheet for the sixth quarter displayed a deficiency of upwards of £22; the present one shows the debt paid off and a surplus, after paying all expenses of management, rent, &c., of £6 15s. 11½d., out of which a bonus of 8d. in the pound on members' purchases was declared and paid, leaving a balance of £1 10s. 2½d. to carry forward to the eighth quarter.

Co-operation and the Cotton Panic.—The fifteenth annual report of the Oldham Industrial Co-operative Society for the past year gives the following table of sales, in order to show the influence of the late American war upon the society's operations:—

Departments.	1861.	1862.	1863.	1864.	1865.
Grocery . . .	£43,192	£36,871	£30,467	£37,333	£48,209
Butchery . .	2,256	2,986	3,472	5,732	5,223
Boot, shoe, and clog . . .	1,167	814	819	1,322	1,430
Drapery . .	1,060	1,231	1,010	3,586	5,744
Total for each year . . .	47,675	41,902	36,368	47,973	60,606
Net profit . .	3,966	3,141	3,187	4,987	6,438
Amount share capital at end of each year	7,603	6,868	7,410	10,890	15,567

Moulton, Northampton.—The business transacted by this society during the past quarter amounted to £997 18s. 11d.

Little Brington.—The last balance-sheet of this society shows that the receipts for the quarter in the grocery and drapery department have been £558, and in the butchering business, £141; total, £699, being an increase over the previous quarter of £90, realising a net profit of £52 7s. 7d., which, after paying the usual five per cent. on paid-up capital, and allowing £2 for the reduction of fixed stock, gives a dividend of 1s. 7d. in the pound. The butchering business has been a decided success. Since the society began butchering in October, 1864, to the end of last quarter, they have killed 2 beasts, 95 sheep, and 28 pigs.

Wellingborough.—The annual report for 1865 of the Wellingborough Industrial Co-operative Society shows that Co-operative principles are gaining ground in that part of the country. During the year the amount of wholesale business was £154 16s. 1½d.; amount of retail business, £4,030 5s. 1½d.; total, £4,185 1s. 2¾d. Net profits during the year, £272 1s. 2¾d.; dividends to members, £153 9s. 4½d.; dividends to non-members, £39 6s. 6d.; interest on shares, £56 10s.; apportioned for the redemption of fixed stock, £10 2s. 5d.; apportioned for the redemption of estate, £3 11s. 9d.; withdrawals on shares during the year, £82 10s. 4d.; increase in share capital during the year, £167 12s. 3d. The society's capital exceeds £1,300, of which nearly £500 is invested in freehold property.

General Information.

CLUBS AND INSTITUTES.

Leicester.—The Working Man's Club and Institute is in a fair way of starting well. The club house, No. 1, St. Martin's, is now open, and the resident manager is accessible to persons who may desire information. The formal opening took place on the Thursday before Good Friday, and on Easter Monday the full operations of the club were to commence. Working men may join either as weekly, monthly, quarterly, or annual subscribers, on any evening after six o'clock. The general public has been appealed to for donations towards fitting up the premises, and the sum of £80 has been received, so that the committee hope to make up the requisite amount of £100 towards the preliminary expenses, independently of the subscriptions and donations of the members.

Malvern.—On the 22nd ultimo a meeting was held in Malvern, to promote the cause of education among the working classes, by the erection of a suitable hall for lectures, and other purposes. The Right Hon. Lord Lyttelton, the Lord-Lieutenant of Worcestershire, was in the chair. After an able speech from the chairman, addresses were delivered by Dr. Grindrod, Sir Henry Lambert, Bart., W. E. Dowdeswell, Esq., M.P., C. R. Coxwell, Esq., J.P., the Rev. P. Hoskin, H. Lakin, Esq., Drs. Williams, Fernie, and others. Resolutions were passed in favour of the object, and a committee formed. A valuable site for the hall is offered gratuitously by W. Shoobridge, Esq., and Mrs. Shoobridge.

Newcastle-on-Tyne Working Men's Club.—The annual meeting of the members of the Newcastle Working Men's Club was held in the lecture-room of the institution, Nelson Street, on Tuesday evening, the 20th March. There was a good attendance. Mr. Edmund J. Blake, assistant-secretary, read the report of the committee for the past quarter, from which we learn that the number of members during that period has been 100 quarterly, 1 two-monthly, 22 monthly, and 3,674 weekly, making a total average weekly of 398 members. This shows an increase on the quarter of 95 members, and proves that the club is the means of affording intellectual instruction to a large number of the working classes. A library has been opened in the club, and it now contains 430 volumes. The books are kept in the conversation-room, and the library is open free to all, except monthly and weekly members. Nearly £25 have been expended, and there is still £17 in hand to be devoted to the object. With a view to procure standard works at a cheap rate, the committee have made an application to the trustees of "Dame Hussey's Charity," in order to participate in its privileges. There is every reason to hope that the application will be successful. The rules which were adopted at the last quarterly meeting have been passed by Mr. Tidd Pratt, registrar, with some slight alterations, which will have to be submitted to a special meeting of the members previous to getting the club registered and the rules printed. The Monday evening readings, Wednesday dramatic entertainments, &c., have been very successful. The committee regret very much the smallness of the lecture-room, and have endeavoured to get it enlarged, but without success. It is to be hoped that before the next season a larger room will be provided. The attendance in the news-room increases week after week. A drawing-class was attempted to be formed, but owing to the small number who joined, it was not proceeded with. A debating-class has been formed, and the committee wish to draw the attention of members to this class, believing that great good may be derived from the interchange of thought. The amusement rooms have been well attended, and have afforded healthy recreation to a large section of the members, bagatelle and draughts having been the most patronised. The committee have experienced difficulty at various times in preserving order, through the unruly conduct of some of the junior members, and would earnestly urge upon the members generally the desirability of placing the club in such a financial position as to warrant the committee in engaging a resident superintendent, feeling confident that it would conduce to the interests and welfare of the club. During the quarter an instrumental band has been formed, numbering 17 members, and is making rapid progress under the able tuition of Mr. T. S. Watson. Mr. Robert Fisher, the sub-treasurer, gave some interesting particulars in detail as to the working of the club during the year, to show that it was self-supporting. There were a few outstanding accounts amounting to £38 4s. 9d., these having been rendered only a day or two ago. Mr. Fisher showed, however, that the extraordinary expenses during the year exceeded the outstanding accounts. During the year 11,276 weekly tickets had been sold, 418 quarterly, 31 bi-monthly, 62 monthly, and 1 annual. The total amount realised by the sale of tickets was £129 2s. 10d.

Northampton Working Men's Club.—In a circular just published, the committee state that about eighteen months ago, through the liberality of Major White Melville, a movement was set on foot for establishing a Working Men's Club, where, for the small sum of sixpence per quarter, members could enjoy the advantages of a reading-room, supplied with daily and local papers, weekly and monthly periodicals, books, &c., and also find the means of innocent recreation in a variety of games. In addition to this, tea and coffee is provided at cost price. The house originally rented for the use of the club being too small, it was determined to purchase larger and more eligible premises, with a considerable space of ground behind, where a gymnasium and other out-door amusements could be provided. Major Melville handsomely contributed £500 in the first instance, and has since added £100 towards the purchase of the club-house. The cost of the new premises was £1,050, in addition to which, it is estimated, £500 will be required to carry out the intentions of the committee. A subscription has been commenced for the purpose of raising the remaining £950.

Pendleton (Manchester) Working People's Association.—The committee of this association have just secured a site for a new hall and gymnasium, upon a vacant plot of land in John Street, near to Broad Street. The cost of the hall will be about £1,200, one-half of which sum has been already promised by several gentlemen connected with the district. As, however, the committee are desirous that those for whose benefit the institution is more especially designed should have a pecuniary interest in the undertaking, a system has been organised for obtaining from working people weekly contributions towards the building fund. While presenting the leading features of a Working Man's Club, attention will be given to the circulation of good reading, to the extending the benefits of the penny bank system, the holding of temperance and other meetings, providing night schools for males and females, Saturday evening entertainments, and out-door means of recreation. The association numbers at present 800 members, and has upwards of 100 workers employed in its various agencies. During the past three years about £600 have been expended in its operations.

Newcastle Working Men's Club.—A capital entertainment was recently given at this popular and flourishing club, the programme being of the most varied and interesting character. The lecture hall of the institution was crowded. Mr. D. Robertson presided. Mr. George Dodds, Jun., presided at the pianoforte. The usual vote of thanks brought to a close a very pleasant entertainment.

Hollinwood Working Men's Club and Institute.—A meeting was lately held by the committee of the Working Men's Club and Institute, in the Primitive Methodist School, Hollinwood. The principal business done was reporting the progress of the canvass of the various firms and workshops. The secretary stated that some of the workshops had not yet completed their canvass, whilst others in the neighbourhood had not, as yet, interested themselves in the matter, but were expected to do so. More than £60, he said, had been promised by the working men, and about one-third had already been collected, which he was sure was very complimentary to the working men, and would show to the general public that they really were in earnest. It was afterwards agreed by the meeting that Mr. Mellor and Mr. John Wild, of Factory Fold, be appointed to canvass the general public for subscriptions. After other business of minor importance had been disposed of, the meeting was adjourned. During the week £24 1s. had been deposited in the post-office savings bank in the name of the trustees, the gifts of working men only. J. T. Hibbert, Esq., M.P., has signified his intention of subscribing £5 towards the object, and liberal subscriptions are promised by gentlemen of Hollinwood, whose names at present are withheld; but in due course a list of subscriptions given is intended to be published.

Leominster.—A public meeting was held in this town on the 23rd ult., called by requisition to the Mayor, for the purpose of considering the desirableness of establishing a Working Men's Club and Institute. The requisition was signed by more than 100 people, chiefly working men. The worshipful the Mayor presided, and was supported by several of the leading inhabitants of the town. The Rev. H. Solly delivered an address, explanatory of the objects, after which the Rev. A. Porter, Mr. Alexander, and other gentlemen and working men, moved and seconded resolutions in favour of the object, which, after a little opposition, were unanimously carried. The proceedings closed with votes of thanks to Mr. Solly and the Mayor.

STRIKES AND WAGES.

Strike of the Edinburgh Tailors.—The journeymen tailors of Edinburgh, to the number of 1,000, recently turned out on strike. The employers in the city were previously served by the committee with copies of a revised statement of prices, together with an intimation that if the statement were not adopted they would leave work in the beginning of the following week. At a meeting comprising nearly every employer in Edinburgh, they unanimously rejected the statement that the time stated therein is, in many cases, much greater than that really required by an average workman for the performance of the work specified, and that, when the work is carried on with the assistance of machines, payment is asked for work which the workman does not perform. The employers intimated by advertisement that they were prepared at once to begin paying an increased rate of wages which they had agreed upon, calculated upon the basis of the statement they (the masters) had prepared. The time allowed in this statement is, they allege, fair, and even liberal. On the other hand, the men maintain that, while the masters profess to give a rise of 1d. per hour, they are so reducing the time for making the articles of clothing that the rise is merely nominal. This, they admit, does not apply to the dress-coat department; but they hold that the sewing-machine tariff prepared by the masters takes away any advantage even in that class of work. A large number of the men have left Edinburgh for London and Liverpool. We understand that several masters have already acceded to the demands of the men.

Strike of House Carpenters.—In August last the operative house carpenters and joiners of Aberdeen asked from their employers a rise of 2s. a week on the average wages, to commence on the 1st of March—that is, seven months after the intimation. The masters declined to accede to this, but offered a rise of 1s. This was refused by a number of the men, and accordingly some 200 of their number struck work a few days since. It was

found, however, that the masters had come to an agreement that none of them would employ any man who had left his former employer on account of this dispute about wages; and this being considered an approximation to what was denounced in England as the "ticket-of-leave" system, it has been keenly resented by the men, and a considerable number who had not struck on account of the wages dispute have given up work till the obnoxious agreement should be withdrawn. In all, probably well on to 300 men are thus "out." The ship joiners have had their demand conceded to them by their employers generally, so that they remain at work. The average wage in Aberdeen is about 20s. a week. In other branches of trade there is some demand for an advance of wages.

The Advance of Wages Movement among the Farriers.—A crowded meeting of the journeymen farriers of the metropolis was held recently in Cambridge Hall, Newman Street, Oxford Street, for the purpose of adopting measures to procure from their employers an increase in the rate of their weekly wages. Mr. Benneworth, the chairman, stated that a movement had for some considerable time past been in existence in connection with the farrier trade for an increase in the rate of their wages, but in consequence of disunion among themselves, it had never come to anything. Of late, however, that matter had been taken up in a better spirit, and he was happy to say there was a prospect of success. The secretary read a report of the proceedings which had already taken place in connection with the movement. At the last meeting the committee was empowered to seek the co-operation of non-society men, and to bring about that desirable object the committee had zealously laboured. Their chief difficulty had been to get at the non-society men, as they were distributed all over London. As a rule, they found that where the men were the worst paid there they seemed to exhibit the least spirit or desire to attempt to help themselves, being afraid lest they should lose the miserable pittance they were now receiving. The report being adopted, Mr. Hierons moved a resolution, which was carried, to the effect that in the opinion of the meeting it was necessary, for the better protection and regulation of the trade, that a union should be formed of society and non-society men, the object of which union should be to bring about a more equal rate of wages, and give to every man in the trade a fair day's pay for a fair day's work. A memorial was then adopted to the employers in terms of the previous resolution, and after the transaction of some other business relating to the management of the union, the proceedings terminated.

Close of the Strike in the Woolwich Building Trades.—This strike for the one o'clock time on Saturdays, which has lasted four weeks, has just been brought to a close by the employers conceding the terms of the men. The bulk of the men on strike resumed work a few days ago, on the above understanding, but after being at work a few hours were informed that although the one o'clock time had been conceded, the wages would be reduced in proportion. The consequence of this notice was that the great body of the men again turned out, while of the 200 that remained in, one and all declared they would strike at the end of the week, if the old rate of wages was not paid. The result was, that when Saturday came, the men remaining at work were paid the same rate of wages as they were receiving when they worked till four o'clock, and finding this to be the case, the men, as a body, all resumed work at the beginning of last week, and the building trade in the town and district has now resumed its wonted aspect.

Meeting of Brass-finishers and Gas-fitters.—A general meeting of the operatives in the above branches of trade was held recently at the "Two Brewers," Bunhill Row, St. Luke's, when a trade society was established, and resolutions adopted declaring an advance of wages on the present rates necessary, and that measures should be at once adopted for obtaining the same. A committee of sixteen was appointed to carry on the movement, and to report to an adjourned meeting. The greatest enthusiasm and unanimity prevailed.

Threatened Strike amongst the London Tailors.—On Monday, the 26th ult., upwards of 1,200 of the *employés* of the principal master tailors in London met together in the Cambridge Hall, Newman Street, Oxford Street, for the purpose of taking steps with respect to a circular, or "log," recently issued by Mr. Poole, of Saville Row, to the several hundred journeymen in his employ. It appears that some time ago Mr. Poole's men petitioned their employer for an advance of wages, on the ground that, under the then system of task work, they could not, even in the busy season, earn on the average more than sixpence per hour, and they therefore, considering the paucity of work in the winter season, asked for such an increase as would enable an average workman to earn sevenpence per hour. Mr. Poole submitted this memorial to the Master Tailors' Association, of which he was the chairman, and many of the members were willing to comply with the request, but the matter was left in abeyance. Nothing further was heard of it until the 24th ult., when Mr. Poole submitted to his men a "log," or list of prices to be paid for garments made up. The men were told they must either accept that list of prices or leave the shop when the work in hand was finished. It was found, however, that the sevenpence per hour they had prayed for was totally ignored, and that Mr. Poole had altered the list of prices so that, whilst there was an advance of price in the making of certain garments, that for other garments was reduced, so that in the aggregate the journeyman was really in a worse position under the proposed new system than he had been under the old one. After several speeches had been made, Michael Charlesworth seconded the following resolution:—"That it is the opinion of this meeting that the list of prices, as stated by the committee of the Journeymen Tailors' Protection Association, be adopted, and that a deputation consisting of the committee, shall wait upon Mr. Poole, to inform him of the determination arrived at." An amendment was proposed and seconded, that the deputation inform Mr. Poole that the London journeymen tailors were willing to accept the advanced prices on the garments advanced in price, and abide by the old prices with the other garments. The motion was carried with but ten dissentients. It was then unanimously resolved to withdraw all the men from Messrs. Poole's establishment until the "log" submitted by the committee be complied with.

EXHIBITIONS.

The Dudley and Midland Fine Arts, Scientific, and Industrial Exhibition is announced to be opened in July next, at Dudley. The Exhibition will include three departments—Fine Arts, Scientific, and Local Industries. The latter department will consist mainly of two classes—the productions of artisans, and articles exhibited by manufacturers. In the first class, money prizes varying in value from 10s. to £5, with certificates, will be awarded to artisans producing articles of merit in that particular branch of trade in which they are engaged; such articles being entirely either the design or workmanship, or the design and workmanship, of the exhibitors, and made at their cost. Also to artisans producing articles of merit, unconnected with their daily occupation, either the design or workmanship, or the design and workmanship, of the exhibitors, and produced at their sole cost. Preference will be given to the following:—Designs relating to the iron, hardware, glass, or other manufactures of the district, and specially designs showing the application of ornament to articles of domestic use; useful inventions; improvements in machinery, &c.; wood and other carvings; inlaid work; models of machinery, buildings, &c. The district from which manufactured products, or artisans' work, will be received, will be the South Staffordshire Mineral Field, bounded by the towns of Kinver, Kingswinford, Wolverhampton, Cannock, Brownhills, Walsall, Handsworth, Halesowen, and Hagley, all inclusive; but scientific apparatus, works of art, &c., will be eligible from any place, subject to the approval of the committee.

EMIGRATION.

In a letter from Queensland, a recent emigrant says:—"A very large majority of the people who come out here are smart, clever, enterprising, and not over conscientious men from New South Wales, Victoria, South Australia, New Zealand, America, and England, with a very large sprinkling of Scotch; and unless a person is prepared to pit himself against these, he had better not attempt to speculate out here, or if he does, he is safe to be ruined. I allude now more particularly to a person coming out with capital. The labourer and mechanic—and when I say mechanic, I mean the carpenter, bricklayer, stonecutter, blacksmith, wheelwright, &c.—these people, knowing their work, and having health and strength to perform it, can always make sure of plenty of work at good wages, and by economy, industry, and sobriety, must inevitably, in a few years, become comparatively independent of working for a master. The weakly, the lazy, the drunkard, the faint-hearted, and that very numerous class in all countries who don't know how to take care of their money when they have earned it, are no better off in Queensland than they are everywhere else—except that no one is allowed to starve here if it is known. We have no parish workhouses, but we have benevolent institutions, partly supported by the state and partly by private contributions; and the fact of a person being destitute, from whatever cause it may have arisen, is sufficient to obtain him admission to, or a weekly allowance from, one of these institutions. Very few, except widows with small children, orphans, sick persons, the old, the lame, and the blind, ever take advantage of these charities, as it is here held by all classes to be a disgrace to accept charity."

Scarcity of Servants at Hokitika.—The *West Coast Times* of the 8th January says:—"At the present time the demand here for domestic servants is great, and the wages something almost fabulous. Any woman can readily obtain from £2 per week upwards, and if a couple of hundred were landed to-morrow, they need not be out of situations two days. In Melbourne wages are quoted at from £25 to £35 per annum; here we may safely quote them at from £100 to £150 for the same term; and yet, even at that rate, respectable servants are not to be got. The consequence is, that many families who are able and willing to pay handsomely for labour cannot obtain it; and yet, in the Australian colonies, South Australia particularly, female labour goes begging, so much so, in fact, that assisted female immigration is stopped for a period."

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

FIRE BARRIERS.

To the Editor of the Working Man.

Sir,—In my letter which you did me the service of inserting in No. 11 of your journal, I endeavoured to call attention to the inventions wanted at Industrial Exhibitions, and ventured to say there was one which it would be a mercy to produce. I will state what that is. It is a fixed fire barrier, with the screen part movable. There are fire-screens already, but they are portable and troublesome—being portable, they are commonly away and occupying the front of the fire-grate; and when in its place it is an impediment to all cooking before the fire, which occasions its incessant removal. What is wanted is a light frame barrier, so constructed as to hang upon the front of the grate and remain firmly there, but capable of being removed entirely when the grate requires to be cleaned or the ashes removed. This screen would require to project about six inches from the grate, and go down to the ground; but so much of the front of it as is equal in dimensions to the size of the bars of the grate should be capable of sliding, so as to be depressed by the hand whenever access to the fire was required, for the purpose of toasting, cooking, placing sad-irons for heating, or hanging a rack upon the bars to hold a Dutch oven, or any other purpose. The part of the screen thus capable of being depressed should be capable of being raised with entire ease, and remain in its raised position without tendency to fall.

Such a screen would be a permanent fire barrier. Whether up or down, it would effectually prevent crinoline dresses ever coming in contact with the fire. It would keep children's clothes from ever being ignited. Such a barrier should be a necessary part of every fire-grate, whether in kitchen, or parlour, or bedroom. If made with varying degrees of elegance, it would be as ornamental as it would be useful. It ought to be regarded as essential to every grate as a fender. After the frightful experience of the last four years of deaths by fire of women and children in every rank of life, an Act of Parliament ought to be passed, compelling the makers of grates and stoves to affix in the future a fire barrier of some such kind as the one here described, to every grate or stove they send out. We make Acts of Parliament to repress suttee in India, and oblige the Indian officials to see to its enforcement. We interfere with the religious faith of the Hindoo people, and even risk the mutiny of a province, to carry out our notions of humanity by protecting women from death by fire; while, in our own country, 500 women perish miserably by the most horrible deaths for one suttee widow who expires in flames in India. Since deaths by fire in England are entirely preventable by some such arrangement as the one herein indicated, an Act of Parliament would be an act of mercy. But the invention must precede the Act, and therefore I beg to commend the idea to ingenious mechanics.—I am, &c.,

Overlooker.

MR. CLAY'S EDUCATIONAL FRANCHISE BILL.

To the Editor of the Working Man.

Sir,—I can scarcely describe the satisfaction with which I read your article, "Opinions Wanted in Parliament," for I have often thought that such a plan ought to be adopted, to make known to our law-makers the opinion of the country on those great questions which affect us so deeply. I was also much struck with the article contained in No. 5 of the Working Man, "Political Results of Intelligence," for in it I think we have good ground whereon to stand in defence of Mr. Clay's Bill, which has my heartiest wish of success.

Now, sir, I find in the article referred to in No. 5 that the reason given for extending the franchise is, that the working class have greatly advanced in intelligence, in practical good sense, in respect for law, and in the interest they take in public affairs: this is admitted by both sections of the House of Commons. Mr. Gladstone, in his speech when bringing in his Reform Bill, alludes to the same. Now, sir, if it is this intelligence, &c., which is the alleged reason for admitting a portion of the working class to the electoral list, how can they propose to extend it to inanimate material? Are they sure that, by any other plan than Mr. Clay's Bill, they will put the intelligent portion of the community in possession of the franchise? I say it is just as likely, ay, and far more likely, that it will not; for this intelligence and practical good sense, which the working class are said to possess, teaches them they must economise, and live in cheaper houses than the Government Bill proposes; for a great portion of their earnings are consumed in taxes and supporting measures from which they recoil with shame and disgust.

I see nothing in Mr. Clay's Bill that any one should not vote for, although I find several of your correspondents have proposed many alterations to it. I scarcely agree with any of them, for I find none better than the proposition of the Bill; and I do think that the members of the Whitechurch Working Men's Club have done as much to damage the working class in the eye of Government as Mr. Lowe's speech. They say, sir, that they would not have the franchise of intelligence without the ballot, as they feel sure they would be obliged to vote the same way as the masters. I say that any man who could not stand in the face of the world and register his vote is not a fit

person to be entrusted with a vote. I am sorry to hear working men give expression to such sentiments. Let us throw off this mammon-worship and be men; our masters will respect us for it after.—Wishing the Working Man every success, I am, Sir, yours respectfully,

A Workman.

To the Editor of the Working Man.

Sir,—As you have requested working men to give publicity to their opinions concerning Mr. Clay's Bill, I submit mine to your notice. I am a thorough working man, and I have talked to many others of my class concerning the extension of the franchise. Most men seem to think that every person should have a voice in framing the laws by which the nation is governed, in which idea I also agree; but there are many difficulties yet to be overcome before every man can have a vote at elections. I fully agree with an intellectual franchise, although I believe Mr. Clay's Bill will soon be thrown out of Parliament. Every parish should be provided with a registrar of electors, who should supply every man wishing to vote with a printed form in which he, the candidate, should state in his own handwriting his desire to vote, what he considers to be his qualifications for holding such a trust, whether he is a member of any society, church, institute, or club; he should also say whether he has ever been committed to prison for any offence, debt, or otherwise—if so, when the offence or otherwise was committed, and of what nature. In each county, borough, and city, there should be a committee or board of directors appointed, to whom the registrars' forms should be sent when filled up, who should have the power of disapproving any candidate subject to an Act of Parliament framed *upon that subject* for the guidance of the directors. Every candidate when approved should be subjected to an examination in reading, writing from dictation, spelling, the first four rules in arithmetic, and English history. Should he be able to read properly (the Bible, I would say), write intelligibly, and spell words with tolerable correctness, and have enough knowledge of the history of England to compare the present with the past, he should be entitled to a vote at the next election. Any man who would not be at the trouble to get the printed *forms*, fill them up, be examined, and comply with any other little thing that the Government found necessary, would be a man of very little principle, and not worth troubling about, providing the county, borough, or city, be at all expense incurred in getting or sending the forms to be filled up, or being examined in his educational abilities.—Yours truly,

William Frederic Wallis.

Bunstrucks Hill, Tring, March 27th, 1866.

To the Editor of the Working Man.

Sir,—I, too, like others of your working readers, feel interested in the Bill introduced into the House of Commons by Mr. Clay. But it seems to me that a great deal more importance is attached to the franchise than it is worth. I should like to ask my working brothers—as I have often asked myself—what is the franchise, and what will it do for me that I cannot do for myself? To my first question I make answer, it will enable me to vote for one or two members once in three or five years; and to my second I reply, it will enable me to vote for men who would promise to work to lessen taxation, to support measures that would remove temptation to vice and crime out of the way of the people, encourage colonial reform, so that the means of production may be increased, and at the same time remove some of the surplus population. These are some of the things the franchise would do for me that I could not do for myself.

With regard to Mr. Clay's Educational Franchise, I like the principle, because it would recognise knowledge, and, as knowledge is power, it would increase the desire for knowledge. But I would like to add to Mr. Clay's measure a moral test. If a man neglected to educate his children, neglected to pay his debts, or broke the laws of his country, he should be disqualified to possess the franchise for five years—that would acknowledge worth, not birth.

But, it seems to me, that whatever test is adopted—whether it is an educational test or rental, or whatever test it be—it will fall far short of the wants and requirements of the people without the ballot.

I believe, sir, that all governments are the reflex of the people; in fact, that the function of government is negative and restrictive, rather than positive and active; that it depends more upon the character of its men than it does upon the form of government. I believe it to be more important for the welfare of the people for each individual to try to reform himself.

But, sir, in conclusion, I would add it is my belief that there are thousands of my brothers of toil who are both intelligent and moral enough to be possessors of the franchise, who would feel that dignity of citizenship that a man ought to feel.

Allow me to add, that it is seed such as is sown in the Working Man that will work the reforms most needed. Wishing it every success, I remain, yours respectfully,

H. Roffe.

1, *Ram Square, Red Lion Street, Wandsworth, S.W.*

To the Editor of the Working Man.

Sir,—The correspondence in the Working Man on Mr. Clay's Educational Franchise Bill shows that such a measure is viewed with great favour by many of those who are especially to be benefited by it. There are few people now who wish to deprive a man, who is fitted for it, of a share in the government of the country. The principle is admitted; it is a question of details. The exercise of the franchise is a trust, and those who possess it should be qualified to fulfil that trust intelligently. This has always been kept in view in the building up of the constitution of our country. Property was made its basis, and wisely so, for that was then the only test of a man's fitness generally applicable. It is quite true that property and mental culture do not always go together; but if we take those who possess property, we shall find that, as a class, they are more intelligent than those who do not possess it; and even when ignorant, their having property proves that they know how to exercise self-denial: they show that they know how to make the future predominate over the present: this is in itself a virtue, but like many other virtues when carried to excess it becomes a vice. We have a remarkable proof of this in the case of our 40s. freeholders. I have had considerable opportunities of observing the way in which they exercise the right of voting, and I have invariably found that, with few exceptions, the illiterate among them look upon the possession of a vote, not as a trust, but as a property to be made the most of. I have not had opportunities of making observations with respect to borough elections; I can, therefore, only judge by inference. We find in small boroughs that nearly the whole of those on the register exercise the right to vote; in large constituencies there are great numbers who do not do so. Now, in small boroughs votes are often purchased by a direct money payment; in large ones they are bought through the publicans. The publican's tap is not so tempting a bait as the hard coin, and, therefore, the inducement to the ignorant and selfish to record their votes is not sufficiently great. It appears, then, that the mere possession of property is not sufficient, and, therefore, that an educational franchise is also required. But I would take a wider basis than Mr. Clay, though I would scarcely go so low. His qualification seems to be the same as is required for the fifth standard in our national schools. Now, a boy who has been kept regularly to school will pass that standard at ten years of age; in one year more he will pass the sixth standard; and even should he go to work at ten, he might attend an evening school, and still pass the sixth standard at the end of the year. With all the educational advantages of the present day, he may keep up his acquirements after leaving school, even if he does not increase them. Neither fractions nor decimals are required in the sixth standard, but to work sums in practice and bills of parcels, to read a paragraph from a book or newspaper, and to write one from dictation; certainly not too much to require.

With respect, therefore, to the Educational franchise, I would admit as qualified all who had taken a degree at any university in the United Kingdom; all medical men holding a diploma; all schoolmasters holding either a Government certificate or a diploma from the College of Preceptors; all who had passed the Oxford or Cambridge Middle-class Examinations; and all those holding a certificate from the Society of Arts. All others should be required to pass an examination similar to that now required in the sixth standard.

With respect to property qualification, all those who had qualified under the Educational franchise should be required to hold a property qualification, as at present, or they should have insured their lives for not less than £100, or bought an annuity of £20 per year, and have paid three years' premiums in either case, or should have not less than £50 invested. Under this plan, none would be excluded who chose to make an effort to obtain a vote—none others ought to be admitted. Of course those who marry before they are out of their teens, and without money enough beforehand to pay the marriage fees—as too many do—would have great difficulty in getting on the register.

Before concluding, allow me to make a few remarks on the progress of education. I have now been master of a national school seventeen years, and I can safely assert that not ten per cent. of the children of the purely labouring classes stay at school to reach the fourth standard, where compound rules (money) are learned. I have charge of a school where no payment of any kind is required, and where every inducement is held out by the manager and employer of labour in the district to the parents to send their children; yet, in spite of all this, there are hundreds growing up who may be said to be unable to read and write, for it is found that those who leave school before they can read and write with tolerable facility, almost invariably cease to practise the art, till they at last become unable to do so. Nor must it be said that it is making education a gift that causes it to be undervalued. I was master of a school for fourteen years where a small payment was required, and, though only one penny per week, it was continually used as a reason for not sending children to school. There are, as we are all well aware, plenty of noble exceptions among the working classes. I have known people deny themselves the common necessaries of life for the sake of securing an education for their children. Such men are truly noble, though untitled. Men of this self-denying stamp, in whatever rank found, are the mainstay of a country, and none of them ought to be excluded from a share in its government.

By holding out an inducement such as I have sketched in the foregoing, I am satisfied a great impetus would be given to the cause of education. It will take several generations to educate the people at the rate of progress we are now making; either greater inducements must be held out, or compulsory powers must be used. I speak from considerable experience in agricultural and mining districts. I have not gathered my information from books: I have followed the plough; I am, in a great measure, self-educated. I am proud of my country; I want no violent changes; I wish to see improvement, not destruction. I have taken a high position as a teacher; I have made some provision for the future; I have paid income-tax for several years; and yet, because I do not choose to be pestered with a little 40s. freehold, I have no vote; but I would rather remain without one than be admitted along with the ignorant and selfish.—I am, Sir, yours, &c., S.

To the Editor of the Working Man.

Sir,—I do not share the views of your correspondents who, on one side, say that the Bill of Mr. Clay, if passed, would be sure to be put on the shelf, nor of those who believe it would be hailed as a boon, and be accepted immediately. The idea is too novel, and the prejudices which are sure to obtain must be combated with earnestness and by earnest men. I hold the opinion, with many, that the possession of the franchise is the birthright of every Englishman. At the same time, I believe it would be no good to him without that other birthright—a good education. The passing of Mr. Clay's Bill would lead to universal suffrage, and to what I consider of more importance—universal education. Seeing the rapid progress education has made of late, I do not think it would take a long time to obtain both. Some whom I have asked about the Bill agree with me that it is the best, and in the best form. I, at least, am not above conversion, if it can be shown that there is a better form. Some, on the contrary, say they do not care about a vote. It would be no good to them; especially without the ballot. All are for the ballot. I never yet succeeded in engaging a man in conversation about the franchise, who did not want the ballot for protection. I have no faith in this Bill passing into law, unless great pressure can be brought to bear upon the House of Commons. I believe there are but few Members of Parliament who are in earnest about enfranchising a larger number of people.

I will do my best in helping to form a league, and shall be happy to meet a number of working men to discuss the matter. A number of small meetings might be held of men in different neighbourhoods—a limited number might meet at some one of our homes. A conference could be held afterwards of all the men who had attended the local meetings in London in some central place. Other large towns could do the same, and we should soon have a large society to do the work.

W. B.

TO CORRESPONDENTS.

R. M. H.—Hair pencils, or brushes, are made of the finer hairs of the marten, badger, &c., for the purposes of the artist; or of the swine, hog, &c., for coarser work. They are mounted in quills or tin, according to their size or the use to which they are appropriated. A perfect pencil should swell all round from the base, and diminish upwards to a fine point, which should be solely produced by the tapering of the tips of each hair towards the centre, the entire form taking a conical shape.

Mechanic.—The population of Canada is, according to the census of 1861, 2,507,657. It is a favourite field for emigration.

R. B. Nichol.—It is not for us to state what books you ought to study for the purpose of gaining a knowledge of the question. Our primary object is to elicit the actual opinions of working men themselves, together with the facts or reasons on which those opinions are based.

M. T. Morrell.—We are glad to find the services of Dr. Holland are being recognised by the more intelligent class of working men, but it is doubtful whether the project alluded to by you would be successful at present.

Chas. Wilkinson.—The lines possess merit, but the style is unsuitable for our columns.

B. F.—The essays are intended to be, as much as possible, expressions of working-class thought upon the subjects given. (See reply to R. B. Nichol.)

A Subscriber (Long Lane).—The usual method of hardening steel is to heat it to a cherry redness, and then plunge it into cold water. Steel is a very capricious substance to deal with, and requires much experience in working to obtain any desired effect.

John Smith.—The introduction of the aniline dyes has produced quite a revolution in the art of dyeing. The old processes are given in Napier's treatise, in the *Encyclopædia Metropolitana*.

George Martin.—French polish is the best thing for your purpose, applied in the usual manner, which you must learn by seeing it done by an experienced workman. Description would not avail.

Amateur.—We do not know of any "best market" for inlaid wood-work. A walk through Clerkenwell will introduce you to a good many manufacturers of this kind of product.

G. P. H. F.—Sims's "Treatise on Mathematical Instruments," and Baker's "Mensuration."

H. A.—It is impossible to answer your inquiries in this brief space. A treatise would be required.

J. W. Bampton.—Procure the Parliamentary Report on the Charities' Commission.

J. Orwell.—A good, hard cement for uniting stone flagging, lining cisterns, &c., is made of 90 lb. of well burned brick, reduced to powder, mixed with 7 lb. of litharge, and sufficient drying linseed oil. The cement is applied in the same manner as plaster, the substance to be covered being previously moistened with a sponge. If any flaws occur in drying, they must be filled up with the cement, which hardens in three or four days.

Chisel.—Gilders' composition for frames is made of ten pounds best Scotch or Russian glue, soaked, and boiled in a very little water: it should be at least four times as thick as carpenters' glue. Take six pounds of powdered resin, and add linseed or resin oil to form a thick paste; melt with gentle heat, and allow to cool to 212°; then add the compound to the melted glue, and thoroughly mix. Then stir in sifted whiting, and knead the whole together like bread, form it into cakes, and leave it to cool. This composition may be brought into use at any time by the application of steam or other source of heat.

Method.—Proficiency in any given handicraft can only be obtained by actual experience. Books may afford hints—and valuable ones, too—respecting the nature and character of the several processes, but mere book-knowledge will not make you a proficient workman, although it may greatly facilitate your attempts to become such.

Weaver.—We have not lost sight of the subject alluded to, and hope to have an article treating of the same in our next number.

THE LONDON CENTRAL

Painters' Hall Company,

LIMITED.

Incorporated under "The Companies' Act, 1862," whereby the Liability of each Shareholder is limited to the amount of his Shares; and no Shareholder will be allowed to take more than Ten Shares.

BIRKBECK DEPOSIT BANK, 29, Southampton Buildings, Chancery Lane.

Solicitor.

Secretary (pro tem.).

WILLIAM HENRY TOFTS.

Temporary Office.

39, UPPER JOHN STREET, FITZROY SQUARE.

OFFICE HOURS: 7 to 9 P.M.; Saturdays, 3 to 5 P.M.

This Company is established for the purpose of Leasing or Building a Painters' Trades Hall, Library, and Reading Room, for the use of Trade, Benefit, and other Societies.

PROSPECTUS.

Seeing the great evil of having our meetings at public houses, and the necessity of improving our condition, both morally and socially—conscious of the difficulties and failures that have attended all former efforts in this direction—we have taken a broader basis as the foundation of our work, and a fixed determination that no effort shall be wanting on our part to ensure its success.

To remove the existing evils of public house meetings, the London Central Painters' Society members have formed a Company, on the principle of limited liability, for the purpose of leasing or building a hall in a central part of London, such building to consist of a hall capable of holding 1,000 persons seated, library, and reading room, with large rooms for the use of various societies to hold their meetings in, with committee and refreshment rooms attached, lavatories, &c.

The calls are made easy, to enable working men to take up shares. All are invited to co-operate in the scheme; and, to prevent monopoly, no shareholder will be allowed more than ten shares.

The promoters of the Company are, on allotment, to receive the money outlaid for the promotion of the Company, and no further remuneration until 10 per cent. has been divided amongst the shareholders; any profit over and above this rate to be divided amongst the shareholders and promoters, in proportion of two-thirds to the shareholders and one-third to the promoters.

For the many benefits it will confer upon them, it behoves the working classes generally to devote their entire energy to its advancement, and take every opportunity of making it known and appreciated; as we advance in years, numbers, and intelligence, great and numerous will be the advantages which those who come after us may acquire through our earlier exertions.

The promoters, in bringing this scheme before the working classes, feel the greatest confidence that, if supported by those it is intended to benefit, it will prove one of the greatest advancements of the age, both morally, socially, and financially, and will ultimately produce a large dividend to the shareholders.

FORM OF APPLICATION FOR SHARES.

To be retained by the Bankers of the Company.

No.

To the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED.

GENTLEMEN,—I have paid to your credit at your Bankers the sum of £ , being a deposit of 2s. 6d. per share on shares in the above Company in respect of such shares, or in respect of any less number you may allot me, and I agree to pay the further sum of 2s. 6d. on allotment thereof, and the instalments according to the terms of the Prospectus.

Name in full,

Residence,

Profession or Trade,

Dated this day of 186

If it is not convenient to make the deposit with the Bankers of the Company, the form may be sent by post to the Office of the Company, accompanied by a Crossed Cheque or Post Office Order for amount of the deposit, which will be paid into the Company's Bankers, and the Receipt returned by post to the Applicant.

BANKERS' RECEIPT.

To be signed by the Bankers and returned to the Applicant.

Received this day of 186 , of for the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED, the Sum of on account of an application for an allotment of Shares in the undertaking.

Apply at the office of the Birkbeck Freehold Land Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO INVEST YOUR MONEY WITH SAFETY, at 25 per Cent. Interest. Apply at the office of the Birkbeck Deposit Bank. All sums under £50 repayable upon demand. Current Accounts opened similar to ordinary Bankers. Cheque Books supplied. All cheques exempt from Stamp Duty.

Office Hours from Eleven till Five daily; on Saturdays from Eleven till Two, and on Monday evenings from Seven till Nine.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to FRANCIS RAVENSCROFT, *Manager*. [32

The Planet Permanent Build- ING AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The Sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [33

DRAWING IRON PLATES FROM THE FURNACE.

Tin-plate Works.

TIN plates are made of tinued sheet iron; but a description of the mode in which iron is converted into plates or bars would be out of place here, coming, as it does, more properly into a description of iron-works.

After the sheets of iron are rolled out, they are taken to the shear-house, to be trimmed and cut to the size required under a powerful blade, which is worked up and down by steam-power. Several plates are cut together, and, as they adhere somewhat closely, they are handed over to girls to be separated previous to being weighed, and are taken thence to the "black picklers." Here men place them in leaden troughs containing acid and water, the action of which removes the black, scaly impurities from them, and improves the surfaces. They are now taken out and washed in clean water, in an iron trough, by girls, looked over one by one, to see if the acid has properly done its work, and those upon which impure spots still linger are returned to the black picklers, who dip them afresh, and they are afterwards rewashed in water.

RUBBING TIN PLATES.

From the black-picklers they are taken to the annealing-room, and piled up in quantities upon iron pans. Strong iron pots are then turned over them, and sand poured upon the points of junction between the pots and pans, to ensure more perfect exclusion of the air. The long iron "trolley" is next brought into active requisition, for the purpose of placing the heavy iron mass in the annealing-oven; and this operation requires the services of four or five individuals. In "first annealing" they are allowed to remain in the furnace about six or seven hours, then brought out and allowed to cool till the next morning. Our first engraving shows the men

drawing a pot out of the furnace, four men pulling at the handles, &c., and a lad swinging upon the trolley, to assist somewhat in balancing the load at the other end. After being once annealed, they are taken to the "cold rolls" (a couple of polished iron cylinders), and passed through repeatedly, for the purpose of closing the pores, solidifying the metal, and putting on a polish. A second annealing process has then to be undergone, and after they have cooled, a workman wheels them away to the "white picklers." There they have a little sand and sawdust placed between them, to facilitate the next operation, which is that of dipping them in a very weak solution of acid and water made hot. This still further cleanses them, and a girl, standing at a trough containing water, well scours the surfaces with a ball of hemp, which she continually dips into a little pan of sand. They are again washed in pure water, and taken thence to the tin-house to be dipped. (See illustration, page 228.)

A man called the "tinman" stands before a kind of square furnace, divided into two compartments, one containing grease made very hot, and the other melted metal—that is, a mixture of tin and lead. The plates are first plunged, one by one, into the hot grease (without which the tin will not properly adhere to the iron sheets); then taken out and plunged into the metal bath. The tinman passes them to the "wash-man," who stands by his side, and has also a divided furnace before him, each compartment containing liquid metal, upon the top of which floats grease to the thickness of two or three inches. This metal is somewhat purer than that in the tinman's bath, and into it, through the floating grease, each plate is dipped in succession. When withdrawn, they are placed in a little rack, suspended in a third bath, containing pure tin, when they receive the final coating, are afterwards drawn out, and the superfluous metal allowed to drain from them as they hang in the rack.

When the surface is sufficiently dry and hard, the plates are handed over to girls to receive a final polishing, which is performed by placing them one by one in a box, or trough, filled with "sharps" (a kind of meal sold by corn-chandlers), and well rubbing them all over with a handful of hemp. (See second engraving.) They are afterwards dusted with a piece of sheepskin, with the wool on, and taken to the sorting-room, where a number of men, standing in a strong window-light, separate the different qualities. Next they are counted out, weighed, and packed in flat wooden boxes, each containing about one hundredweight.

Our sketches are taken from the works of Messrs. Budd & Co., Tividale, near Dudley.

Mr. Gladstone and the London Working Man.—At the Liverpool Reform Meeting, Mr. Gladstone, contrasting the present condition of the working man with that existing in 1830, said:—"I won't go back to those unhappy and deplorable collisions between the authorities and assemblages of the people which now raise a blush on the cheek of Englishmen; but I will speak of other things, and of one that is familiar. At that time there was a fund of popularity attaching to parodies of very well-known and very sacred and solemn documents of our religion. Their well-understood forms of expression were twisted, in order to meet popular favour, into a sense adapted to express the wants and sufferings of the people. I happened, when not long ago in a humble street in London, to hear a couple of men singing a parody of that kind. It was a parody of the Church Service in the Prayer Book, and the expressions were altered so as to refer to the great supposed misery and misgovernment of the people. This was within the last few months; and I had the curiosity to wait near these persons for a considerable time, in order to see what took place. They were successful in gathering round them a group which appeared to vary from between six and twelve, boys and girls; and those boys and girls, I am bound to say—thereby testifying to the improved condition of the working class—did produce various pennies and halfpennies, with which they purchased copies of these wonderful productions. But my curiosity was to see what testimonies of popular interest they would receive from the adult working men. It was about six o'clock in the evening, when they were going home from their work, and passing by to and fro. I saw but one person of an age to receive wages as a working man stop near this group, and, having listened for about half a minute, he went on, with evident indications of contempt."

The iron armour-plates destined for ships now building are tested severely under the new regulations of the Admiralty. They are peppered at by 95 cwt. 8-inch smooth-bores with spherical shot, and 13 lb. (not 16 lb., as formerly) charges, at a distance of only 30 feet.

Our Cricket Club.

The cricket season opened on Good Friday; and, although it is too cold and damp at present, and the evenings are too short, to admit of practice, we have enough to do in arranging our plans for the coming summer; and when the days draw out, we shall be quite prepared to astonish the natives at Victoria Park or Battersea by our Saturday afternoon performances. For on Saturdays we knock off early; and off we start to enjoy three or four hours' cricket.

Our club is not a very large one, but we contrive to muster an eleven who are supposed to be able to play any other shop eleven likely to be brought against it. Of course we often get a severe beating, and ducks' eggs figure sometimes in our score with unpleasant frequency. But that is not our fault. The best players make a bad score sometimes; and in such cases with us the ground is out of order; or we have got hold of the wrong bat; or the umpire would insist our legs were before the wicket, when they were not; or the bowler stepped in at least a yard, though the other umpire declared he did not; or the man at the opposite wicket would not move when he might have got the run as easily as anything, and left us in the lurch beyond the crease, while the wicket-keeper tipped the bales off. But sometimes we make long scores and win; and then don't we talk about it for a week after! That drive for three was a drive, if you like; and the style in which Charley Biggles threw up from long field off, and took the wicket, before that chap with the black whiskers could reach his ground by a yard, was worthy of Ben Griffiths or Alf Clarke. You see we know all about the professionals; and if we did not call them by their shortened Christian names, perhaps people would think we did not know them, which we should feel as an imputation upon the club generally.

We pay a small weekly subscription during the season, and we have a secretary, who writes to other secretaries, and makes matches, and sometimes breaks them off in just indignation, when we hear that the rival club is trying to sneak in a professional bowler as one of their eleven. When the season is about to begin we have a meeting, to draw up rules—not rules for playing, for, of course, we adopt the Marylebone Club rules; pretty cricketers we should be if we did not—but rules for the management of the club. We generally require three meetings to discuss them and to arrange our proceedings. The secretary, who is a great cricketer and authority, has doubts about the condition of the ball, which, though it has been in grease all the winter, does not seem to be quite so right as might have been expected. We feel that we shall scarcely be able to do justice to ourselves with that ball, and a new one is voted, which starts a fresh difficulty as to where it is to be bought, which is a matter of great importance, and much discussed by several of our most experienced members, sometimes, I regret to say, in vigorous and even acrimonious terms. Then the bats come before the meeting. There are grave doubts about one, which is accordingly taken in hand by several of the crack batsmen, who hold it as if blocking, and tap the floor with it three times, then give the cut, and the drive, and the leg hit, with the appropriate attitudes, which very much impress the younger members. At the end of the season we balance the accounts, and sometimes find that we are slightly indebted to the treasurer, which fact, when announced, causes a great deal of dissatisfaction, and the withdrawal of three-fourths of our members, who, however, always join again when next summer comes. But the fact that the secretary and the treasurer charge half-a-crown each for refreshments when going a few miles out to arrange about a match, is never quite forgotten, and, in short, to put it mildly, is very much talked about in the shop.

In the club, of course, we have various kinds of players—tolerably good, indifferent, and very bad. Some are such tremendous cricketers that they can think or talk of nothing else during the season. When passing each other in the shop, one will bowl an imaginary round arm and call out, "Play," and the other stoop down, with the knees bent in, one leg stretched out, and his elbows on his knees, just as Tom Lockyer does behind the wicket, and says, "How's that, umpire?" which is very effective indeed. If one of them wants any tool or small article which the other has, he calls out, "Thank you," which is the cricketer's way of asking for anything, although people who are not cricketers only use the words when they have got what they want. Charley Biggles, already mentioned, talks cricket tremendously, and is a cricketer every inch of him. He actually possesses a pair of flannel trousers and spiked shoes, and some of our jokers declare that he carries a cricket-bat, rolled up in a pair of leggings, under his arm when he comes to work, hiding them till he leaves in the evening, when he carries them back again. Certain it is that he finds it necessary to wear a cap made of pieces of red and white flannel very often when he is at work, and that he has been seen with the pads and spiked shoes on when only looking on at a match. When he is on the ground, waiting to go in, he can never sit still in the tent like the rest of us, but he and one or two of the others always get hold of a spare ball, and bowl at each other and catch, or sit astride on bats, in a manner wonderful to behold.

We have a few old members—men who played at cricket when Charley was a baby, and who have seen Lillywhite (not any of the young ones of the name), and Felix, and old Clarke, and who always play in their shirt-sleeves and with their hats on, and bowl slows with a twist, taking their time about it, and rolling the ball slowly along, and—when it is sent flying over the head of slip, and long field goes running after it with all his might, and the bats are getting runs like anything, and everybody else is calling out, "Now, then, throw it up," "Run again," "Three for that," and so on—say, "These young fellows don't know how to play slow bowling"—though the young fellows have their private opinion on the subject.

Our cricket club is a capital club, there can be no mistake about that; and first-rate amusement and exercise the game is. We expect to do great things this season; and perhaps I may report, at any rate, one or two of our best matches.

---

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

HOW TO DEAL WITH THE YOUTHS.

Before continuing the consideration of particular Clubs, it may be desirable to look closely into one of the chief causes of failure in them. I propose, therefore, now to indicate what experience suggests as the best means of dealing with youths in relation to the clubs which they have so uniformly wooed, and too often won, with a passionate and fatal ardour worthy of the most dismal and romantic scenes in a modern sensation novel.

The *first* and most obvious course is to establish a Youths' Institute, on the model of those capital ones at Islington and Bayswater. The plan was initiated and successfully carried out originally by the Rev. Henry White, M.A., at Dover, and has since been admirably worked by Mr. Baker at Bayswater, and Mr. Tabrum, at Islington, with the help of a few other devoted friends. It is to be hoped that a full account of these institutes will appear before long in the Working Man.

But, *secondly*, when the requisite funds and premises cannot be obtained, and youths under the age of twenty-five are anxious to join a Working Men's Club and Institute, they may be safely admitted to the use of the reading-room and library; also to classes, if separate rooms and teachers can be procured, and to lectures, concerts, and other entertainments, if there is a large room or hall belonging to the club, or one hired for the purpose, and large enough to accommodate both them and the grown-up members and their wives.

Thirdly, youths may be admitted without mischief, in many cases, to a recreation-room besides the above-mentioned room, provided it be kept quite distinct from the one used by the men. It is, however, very doubtful whether—at all events, in large towns—it is desirable to have a bagatelle-board in it; for experience shows that in several instances youths have learned to play at bagatelle in the club, have acquired a passion for the same, and have afterwards become systematic players

* Continued from page 215.

for money at a public-house. Even where that has not happened, it must be confessed that there is generally a great deal of noise connected with the game, and disorderly youths are attracted by it, so that the older members are annoyed and repelled; while, even though no betting or stakes are allowed by the rules, it sometimes happens that lads and youths play for beer, bet, and then adjourn to the public-house after the game to settle their accounts. Of course, no good is without some attendant evil, and the abuse of a good thing is no argument against its use. But it is by no means clear that bagatelle-playing is so decided a benefit for youths as to counterbalance its dangers. Unquestionably it is of the greatest importance, as was well urged by two highly-intelligent and respectable working men at the last London Secretaries' Tea-meeting, that these clubs should not fall into the error of the old Mechanics' Institutes, and frown upon recreation. Amusements must form *an essential part* of their programme. But it is very different providing bagatelle-tables for grown men, whose characters are comparatively formed, and who would only use them, in general, as gentlemen use their billiard-tables, for an occasional relaxation, and letting youths give themselves up to the game, night after night, perhaps meanwhile acquiring a taste for betting and gambling. If these younkers would consent to vary their bagatelle-playing with attendance at classes and lectures, and if a vigilant yet amiable member of the committee, or other official, could guard against betting and rioting among them, the game might be simply a useful and pleasant diversion for them, just as in the drawing-room of a gentleman's home.

But, *fourthly*, in all cases I would recommend the adoption of a plan in practice at some clubs, viz., of admitting youths, if at all, *only as associates*, not as full members, until they have reached a specified age, which I should strongly advise to be fixed at twenty-five years. They would thus obtain no power to interfere with the management of the club, nor exercise the right of voting, until their age (and, perhaps, previous satisfactory connection with the club as associates) gave some guarantee that they would exercise the privileges of full membership judiciously. In all such cases it would be well to require—as is now done in some clubs, when youths under twenty-one apply for admission—that they should bring a recommendation from two or three of the older members.

No doubt there are strong reasons for leaving the managing committee some power to admit, in one way or another, youths under twenty-five, or even younger. A father may wish to join a club chiefly for the sake of encouraging his sons to attend it, and his presence there, or their own characters, testified to by himself and some other members of the club, may be a sufficient guarantee that they will conduct themselves quietly, and not annoy the older members.* And when youths can be brought into a club without annoying older men, and without learning bad practices there, it is not only a great gain to themselves, but ultimately to the club, of which they will probably, in time, become staunch and valuable members. Of the value to themselves an amusing little illustration occurred some time since. A youth, whom it was necessary in a certain Working Men's Club to suspend, for misconduct in annoying other members, when refused his ticket, said, "Well, I *am* sorry." "What call have you to be sorry for?" said a companion. "There's nothing to be sorry for." "Yes, but there is," replied the other. "Since I belonged to the club I've bought a new shirt, a new pair of stockings, and a new pair of boots!" Poor fellow! We hope he learned something by his punishment more valuable than all he had gained by belonging to the club. A friend writes:—

"Speaking to some young men whom I met one evening at the club, I asked them what they thought of it. In a moment, without thinking on the matter, they exclaimed, 'Mr. ——, it is a *home* for us!' One of them told me he used to spend his every evening at the public house, but now he spent his evenings at the club."

Lastly. On the principle of dealing with facts as we find them, I must not ignore the hapless condition of many existing clubs, which, before they knew the deadly nature of the mistake, admitted these youthful, innocent-looking allies into the heart of the citadel. (One is sorely tempted here, by way of a lively illustration, to trot out that Trojan horse, once more, which did Mr. Gladstone such good service in his eloquent peroration when introducing the Reform Bill, but the line must be drawn somewhere, and I forbear.) Now, the managers of these youth-oppressed clubs, round which treacherous and deceitful juveniles are clinging, like drowning victims to their would-be preservers, may fairly turn to me and say, "This is all very fine, if we had only known it a year or two ago, and had then adopted the precautions you suggest; but now two-thirds or three-fourths of our members are under twenty-five. They have driven away all the older men, except those who are content with the quiet reading-room, and lectures, or entertainments. We cannot afford to send them packing, or we could not pay our rent, and should not have thirty members left." Now, in answer I might say that, if they cannot have those separate chat and game rooms above proposed; and that, if the club was really established for men, and not for youths, the sooner they left off perverting it from its legitimate purpose the better; that, moreover, as soon as it became known in the neighbourhood that the youths had really been bowed out, the men would gradually return. But there is a middle course which may be suggested, and which, in many cases, might be a far better one than making a clean sweep of more than two-thirds of the members of a club. It is this: On the door of one comfortable room have the words painted, "For members above twenty-five years only." This is done in the *Heywood* Club with good effect. It secures one room, in which grown men can always be secure from the presence of lads, where they can at all events have their chat and their pipe in peace, and talk without constraint. This, after all, is the thing of most importance; and if they want to use the bagatelle-board, they must form their own party and take their turn. At *Clerkenwell* Club they have the great advantage of having a separate entrance and staircase for the youths, as well as separate rooms; so that, in fact, it is like having a Youths' Institute in connection with a Working Men's Club. Nothing better than an arrangement of this sort could be desired, if it be strictly carried out.

I shall be very glad of any practical suggestions or comments on the above remarks that managers and members of clubs may have it in their power to offer.

* Of course, some young men under twenty-five, or even under twenty-one, may be much steadier and pleasanter company for grown-up men than those of older growth. But, equally of course, these cases are exceptional, and we cannot legislate for exceptions.

A Bit of Work-a-day Biography.

Now, do you know, I never like to hear a word said agin them schools, though they aint the sort of places for a respectable mechanic to send his youngsters to. If a fellow don't give too much towards educatin' the publican's daughter at boardin'-school, he can afford to pay for what his own children get in the shape of learning, which isn't much generally. But a ragged-school once did me a good turn, and I shan't easily forget it.

No, it wasn't in that way, tho', I dare say, I may have done, now and again, many an odd job for 'em. I suppose, now, when you came to the business, you was bound to a reg'lar master, paid your footing, worked in a good shop, and learnt the trade in the usual manner. It wasn't so with me, I can tell you.

Well, I don't mind—that is, *to you*; but I shouldn't care to tell it to everybody, although, for that matter, there's no disgrace in my part of the story.

I wasn't above eleven years old when I was brought up to London by my mother. All I knew of my father was that he died years before. I can't bear even now, though it's one-and-twenty years ago, to think of the trials and miseries of our first week in London. We had left a clean little village just eight days—why, I never rightly knew; but there was some dreadful reason, for my poor mother made me promise, as she lay on her dying bed in St. Bartholomew's Hospital, that I'd never go back, which I never will. I don't think we had a sixpence when we reached London, and I know we hadn't a friend in the world. It was on the fourteenth of November, and we had been tramping it up since the sixth. We passed the first two nights in the workhouse, and the others—well, never mind, we spent them in a worse place, where my mother caught a fever. A few days after she was carried to the hospital, and on the Sunday following, without a copper in my pocket, and with a heavier heart than I ever hope to have again, I left the big building in Smithfield a destitute orphan. I hope few have ever felt as I did then. I hadn't had a morsel to eat that day, for I started from a low lodging-house in Clerkenwell early in the morning to go to the hospital, and waited outside in the cold for two hours, being shy, you know, and not liking to go in. When they had told me my poor mother was dead, which they did kindly like, they offered me some food; but I felt as if it would choke me, and I refused it.

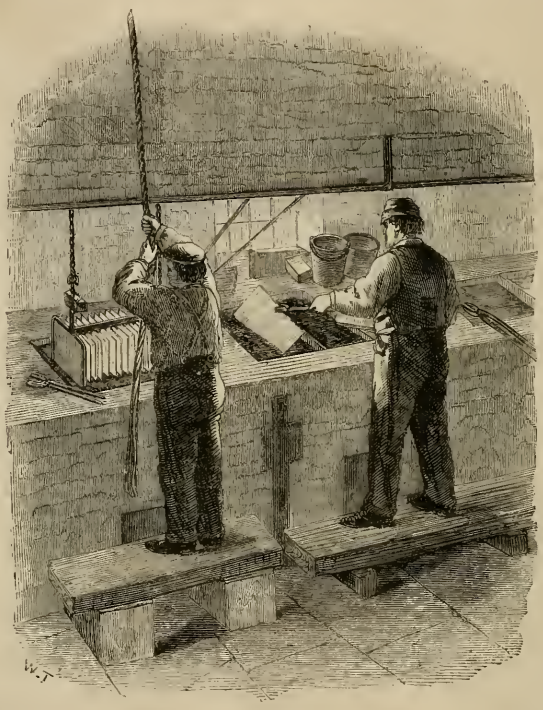
Well, as I was saying, I got among the sheep-pens in Smithfield, and sat down on a sort of post, near to some young chaps as was talking and smoking. You can't think what a sensation it is to feel alone, and to have no place to go to. I knew it was no use to go back to my lodging, as they told me in the morning they didn't want to see me any more, unless I could pay for my bed, which was twopence a night, and I already owed 'em sixpence. So I sat thinking and crying, not knowing what to do. Presently the lads behind me began to toss for halfpence, two or three of the younger ones standing some distance off to watch for the police. As soon as he came in sight one of 'em would whistle, and the game was stopped till he passed. It happened that one of the coppers rolled along up to my feet, and one of the biggest of the lads followed it, and, seeing me crying, asked me what I was blubberin' at. "I'm hungry," says I. "Well," says he, "you watch at that corner for the bobby, and I'll give you a brown." Off I scampered, as you may suppose, and fairly earned what he promised. When their game was over, of course I wanted to be paid; but they didn't seem inclined to dub up, for the fellow that engaged me had lost, and the others only laughed when I tried to explain the bargain. One of 'em, however, a bit kinder-looking than the rest, as I thought, proposed that the winner should pay me, which he did, and then my friend, for I can tell you I at once looked upon him as such, asked me where I lived. "Aint got no home," said I. Then he turns round, and whispers to one of the others, a tall, lean, bony-looking chap, with a hairy cap, who they called captain, and who I noticed broke one of the commandments every time he spoke. Well, to make a long story short, the captain took me home, which was in one of the streets long since pulled down, up again where the underground railway now is.

For four days I lived with the captain and his friends; there were three of 'em, besides two women. It was a four-roomed house, and I slept in the front parlour on the floor, along with another lad several years older than myself. On the Thursday evening the captain told me he should want me to do a job early in the morning. I was glad to hear that, for I had done nothing for my board and lodging, such as it was, but run a few errands. I asked my bedfellow what kind of work I was going to do, but he only said, "All right, you'll see." Somehow or other I couldn't get to sleep that night, what with thinking of my mother lying dead at the hospital, and wondering what was to become of me. I must a' tossed about a bit, I know, for Jack—that was the name of the lad I slept with—swore awful oaths at me, and threatened to turn me out if I didn't let him rest. I heerd the church clocks strike hour after hour; the ticking of an old Dutch clock in the corner, and the dripping of the rain off the leads just outside, didn't soothe me a mite, though some folks say they're first-rate things to make you drop off. It must ha' been about half-past three when the captain got out o' bed, for he slept overhead, and I heerd him walk across the room. I put my head out from under the clothes—there weren't many on 'em—and waited for him to knock on the floor, for he always did that when it was time for us to get up. But presently he come back and got into bed agin, as I knew by the creaking o' the bedstead, so I thought he had looked at the time and found it too early. "Worse luck!" said I to myself, for I was tired o' lying still, and wanted a sort of excuse for turning about a bit. It wasn't long afore I heerd somebody coming slowly up the street. I knew the tread of the policeman;

he had been up and down a dozen times, and there was no mistaking his heavy boots and reg'lar step. Presently he—that is the stranger, not the policeman—comes close up agin the shutters and stops, and then up comes somebody else, and they say something in a whisper, which I couldn't catch. I had two minds to jump up and cry "Thieves!" but I was too frightened for that, as I heerd them trying the shutters, as I thought. "Jack, Jack!" said I, giving him a dig in the ribs, "there's somebody trying to get in." Jack sat up in a minute; he was a very light sleeper, as I knew to my cost. He stood up and put his ear against the shutters, which he could do without getting off the rugs which formed our bed, and listened for two or three minutes; then, feeling for his clothes, he told me to get on my togs as quick and quietly as I could. Before I had time to get into 'em, he crept out of the room and up-stairs, and was calling to the captain in a whisper, but loud enough for me to hear him. Just as I heerd the captain's bed creak, three loud raps at the street-door made me jump agin, and, afore I could recover from the shock, Jack had me by the arm, and threatened something terrible if I made any noise. Then the window up-stairs was thrown up, and Mrs. Captain asked who was there. "Jim's wanted," said one on 'em outside. "Aint been home," said she. "Will you let us in, or shall we come in without?" With that down went the window. Then came a scuffling about, and a confused noise at the door, and in walked two policemen, with glarin' bulls'-eyes. Whether they had been let in, or had come in without, as they called it, I don't know; but I do know that they went right up-stairs to the captain's room, and came down again with the captain handcuffed. When they went out Jack and I followed, and I was surprised to see one of the captain's friends, who I knew slept in the first floor back, coming up the street between two more policemen. He had got out at the back, don't you see, bin taken, and was brought round.

When we got to the station-house, Jack tried to force his way in along with the rest; but the chap at the wicket turned him back, telling him as he'd come quite soon enough by-and-by. I could see he was put out, in more ways than one, for he shoved me off the steps angry-like—told me to go to a place as I shouldn't like to find, and ran away, leaving me once more alone in the streets. I shuffled along a short distance in the rain, and then sat down in a doorway, my wet rags sticking to me all over.

(To be concluded.)



DIPPING TIN PLATES. (*See page* 226.)

The Art of Writing Prize Essays.

As many pens are, doubtless, already busy upon one or other of the prize essays proposed for competition in Nos. 10 and 11 of this journal, it may be useful to many if one who had the satisfaction of winning several prizes in former days should detail some of the experience gained in this exercise. In his day there was no one who gave suggestions to new writers. Almost every workman wrote in the dark. Many subsequent years of experience among working men made plain the difficulties under which those new to this sort of effort labour. It may, therefore, be useful to point these difficulties out, and explain how they are to be, or may be, overcome. Many workmen have brains enough, ideas enough, and experience enough, to write a good prize essay, but they do not know how to set about the thing. They never did it—they, perhaps, do not know any one who has done it—and they do not know how the thing can be done. Therefore, it is our intention to see whether a little light can be thrown upon the matter.

Many working men have excellent ideas, and know very well what they mean, but find a difficulty in expressing their meaning. In talking to a friend, they can say plainly what they mean; but when they begin to write they find the greatest difficulty in doing it. They can tell their story to a companion, or talk their ideas over to their wives, and make themselves clearly and perfectly understood.

Now, there is no other secret in good writing than that of talking with the pen. And everybody who wants to write so as to be understood, should aim at doing this. In conversation the humblest men are commonly direct, pointed, and even graphic; and they would be so when they write if they had the courage to write as they can talk. A public speaker is never so plain, emphatic, explanatory, and successful, as when he selects some imaginary ignorant man in a remote part of the audience, and addresses himself to him, forgetting everybody else, and thinking only of explaining his case to that particular individual. Molière, the famous French writer of comedies, used, it is said, to read over all his plays to his housekeeper; and he wrote with her constantly in his mind, with a view to make himself intelligible to her. And if she could not see his point, he altered his point till she could see it. Now, why should not a workman, writing a prize essay, make his wife his critic; talk the matter over with her, and write the matter out until she is satisfied with it? He may be sure, if she understands it, all the judges will; and, in all matters of taste, there cannot be for any man a better guide than the judgment of his wife. It does not matter whether she has learning or not; a woman is instinctively sensitive on all matters of taste of expression. What she does not like is sure to be wrong.

Another difficulty which working men experience in composing an essay is, that they are afraid to express themselves in their own way; and this, indeed, is a difficulty which a great many writers besides working men experience. Most persons, unless very much practised and very much master of themselves, are always trying to express what they think somebody else thinks, instead of what they think themselves. They are wondering what the judges will think, instead of thinking about their own subject. The rule to take is, never to think nor care what anybody may expect to be said upon the subject, but simply to say what ought to be said upon it. What is wanted in a prize essay is the actual ideas, actual experience, actual knowledge, and suggestions of the writer. He must get out his own mind on to his paper. We have somewhere seen a remark by the Countess Ossoli, to the effect that the mere backwoodsmen of America are not only interesting but original, when they talk strong pieces out of their rough lives. When they tell something of their own experience—some thought which occurs to them—some adventure they have had, the result is striking and impressive, and makes the best thing a traveller can put into his book. Every working man who tells his own story in a natural, unpretending way, can always write something interesting. It does not matter how rugged, and even abrupt, the style is, its ruggedness and abruptness has freshness, and freshness is a charm. The thing for him to do, is to get out his ideas somehow, and in the fewest words which will tell his story.

In most cases the working-man writer is afraid he doesn't know enough of grammar. All the grammar required is a very simple affair, and a little understanding will make a man master of it. The chief thing is to make simple sentences. A sentence begins with a capital letter, and ends with a full stop. Every new sentence should have a capital letter, and a full stop at the end of it. A sentence is a distinct piece of meaning. Every piece of meaning has three things in it—a subject, the action of the subject, and the object acted upon. "Charles carves the wood" is an example. "Charles" is the subject, "carving" is the action, and the "wood" is the object of the action. Sentences are, of course, often longer, and fuller of words, but they all have substantially this structure and these parts, and if the writer takes care to keep these parts clear in his mind he will never go far wrong. The only other point is to take care of what are termed the pronouns, or "for-names," as they are sometimes called.

Instead of saying, Charles carves the wood, we may say, He carves his wood. "He" and "his" stand for "Charles" and the "wood." But if one said carelessly, "He carves her wood," this would be bringing another person forward, because "her" stands for a woman. Every Englishman knows this. There is much more in grammar than these two things; but a little carefulness in managing them will keep any Englishman generally right and clear. All the rest will come near enough from habit. A workman is not expected to be a scholar, but to know what he means, and to say it as simply as he can.

The great confusion men fall into is not from want of grammar so much as from want of patience and care. Young writers always try to say too much in a single sentence. Indeed, they generally try to say everything at once. They do not break up their meaning into pieces, and tell one thing at a time. Napoleon used to say to his secretaries, "Be clear—that is sufficient." This single axiom, deeply impressed on the mind and acted upon in composition, will do more for a new writer than all the rules of grammar without it. Clearness conquers. He who sees, and knows what he sees, and can make another see it, will succeed—and working men can be simple and clear as well as gentlemen, if they once give the thing a thought.

Stone-drays in Paris.—A great improvement has taken place in the carriages employed to convey the immense blocks of cut stone used in the new buildings in Paris. For the clumsy two-wheeled dray is substituted a carriage on four wheels made of wrought iron. The substitution of the new vehicles is a great mercy to the unfortunate horses who were placed in the shafts of the old drays, and who, while supporting almost all the weight, were fearfully shaken at the least roughness in the road. It is further proposed to move those stone-drays by steam, in the same way as the machines which are used in crushing the stones in the streets of Paris.

*Building Societies.**

A subscription of 2s. per week for £200 appropriations will take a society about fourteen years to provide all its members with advances. A subscription of 1s. per week, with appropriations the same, will take half as long again, or about twenty-one years. By raising the subscriptions to 4s. per week, and allowing the appropriations to keep £200, we shall get all the advances provided for in about ten years. The number of members in a society does not materially alter the period, supposing that they all commence at the same time. After all the advances are made, it will take five or six years more to receive the outstanding repayments, and to pay back to the members their subscriptions, before the society can be terminated. Thus the 2s. per week society will last altogether about twenty years.

The repayments are generally at the rate of 10 per cent. per annum, or £20 yearly, for £200, *besides the subscriptions.* A working man should be quite sure, before he resolves to use his right to an advance, that he will be able to bear the increased outlay, for he cannot expect to realise more than 8 per cent. per annum, or £16 yearly, from £200 worth of good leasehold property. He will therefore be required to pay £4 per annum more into the society out of his own pocket than he did previous to receiving the advance. Many members of building societies have not taken this into consideration; have got into arrears; been heavily fined; and, at last, had to forfeit house or houses after all. Societies are now established, however, which allow the subscriptions to cease so soon as the repayments commence, and some only require the repayments to be at the rate of 8 per cent. per annum. These are real privileges to the working man, although they are attended with the drawback of lengthening the society some four years. But, as withdrawal is allowed after three years without loss, and as borrowers who have redeemed their properties can retire altogether from the society without fee or deduction, the length of the society is really not of much consequence. Large profits are made by half the appropriations being sold. As much as 40 and 50 per cent. has been the price given for the right to the money. But, as the premium is not deducted from the advance, but payable quarterly during ten or more years, the highest premium is only about 6 per cent. per annum for the sum advanced. This arrangement, while it allows easy withdrawal safely, and offers to investers a tolerable bonus, gives members the opportunity of securing a property, if an eligible one should offer, at a time when they are without any right to an appropriation by ballot, and unable, it might be, to purchase one of any member. The several provisions last mentioned seem to unite to a considerable extent the advantages of both the permanent and terminating systems. We notice a novel arrangement but lately introduced for awarding a larger amount free of interest to the shareholders who are not fortunate enough to get the early rights to advances. By this plan the amount advanced will increase £5 every year. For instance, a member who gets an appropriation the first year will have £200 advanced to him, free of interest; the second year the sum will be £205; and so on, increasing £5 every year, up to the tenth year, when those who may have had to wait that time, and who will then have paid £60 in subscriptions, will have the right to receive £250, free of interest. This seems to remedy a defect hitherto experienced in these societies, and to make them more *mutual.* It has been felt that the members obtaining the early appropriations have so much more profit out of the society than those who may have to wait several years for theirs. The plan here referred to will encourage waiting members, by offering to them a sum which will be the larger the longer they wait for it. The expense of the mortgage is paid by some societies, and repaid by the member by quarterly instalments. But in the purchase of property, the cost of the conveyance is often much more than the cost of the mortgage. And when bargaining for the purchase of a house, the gross amount of the legal expenses should be ascertained. If the property is to be bought through a Building Society, no deposit should be paid, nor agreement signed, until the society's solicitor is satisfied with the title and the directors with the value. We make these remarks because we have met with so many cases where a member of a Building Society has paid a deposit and signed an agreement on account of property which could not be accepted by the society, either on account of its being insufficient, or unsatisfactory security. It is usual to get novices in these matters to sign an agreement, which precludes them from inquiring into the title at all, except at their own expense; and as there are numbers of titles to property in London which would cost £40 or more for a solicitor to go through, we need say no more of the importance to a working man of making every inquiry before he parts with his money, or commits his hand to paper. There is danger of making a bad bargain in house property, under the most favourable circumstances; but if a man wants a house to live in himself, he will avoid a great deal of the trouble and risk which an invester has to put up with. And provided he examines the rules of a Building Society well before he joins, and learns something about the officers of it, selecting a society whose terms suit him, and whose managers have had some experience in Building Society matters, and who, moreover, are known for their honesty and impartiality; and provided, also, that when about purchasing a house he exercises a similar caution, there will be the prospect before him of being, at least, his own landlord for the remainder of his life, and possibly the landlord of other people as well.

The writer can speak well of Building Societies from experiencing the benefits thereof. He began life as a real working man, and through industry in his business, and with the assistance of Building Societies, he now possesses property of the value of some thousands of pounds. He can only say, in conclusion, that he believes a careful perusal of the above remarks (which are the result of many years' experience of the working of these societies), will help his fellow working men to go and do likewise.

* Concluded from page 212.

Imported Knowledge.

We both export and import manufactured articles, and raw material too; but among official imports, "knowledge" is not a recognised article. We never see it set down in any Parliamentary return. The Board of Trade has not the item in any of its "Returns;" it nevertheless exists, as we lately said, and the Government officially import it. We will give examples—or, speaking commercially, we ought to say, "samples" of it.

Lord Howard de Walden, writing to Earl Russell from Brussels, in the month of August last, informs the Premier that the Belgians claim to have been the first to discover the uses of coal; and this discovery, they say, was made by one Hullos, a blacksmith, of the village of Plenevaux, near Liege, in the year 1049, from whose name they derive the word *houille,* which, as we know, is the French name of coal, and *houillère* their name for coal-pit. Lord de Walden suggests that the word *houille* is generally considered of Saxon origin, which would show that coal had an earlier than Belgian origin; and he suggests that Theophrastus proves that coal and its uses were known to the Greeks, some generations before the Christian era. It is supposed that coal was known and used in Belgium earlier than the date above given. There is, however, further curious information communicated by Lord Howard de Walden.

The earliest mention made of the existence of the rights of property over Belgian coal-pits occurs in 1297, in connection with an Act of John, Count of Namur, which granted to the Sieur de Borgelles the right to work for coal in Charleroi. In a record of the year 1443, it is stated that any person had the right to dig for coal, even on land not his own, by obtaining permission from the mayor, as representing the seigneur, to work a seam which he had discovered, on the condition that he should pay to the seigneur one-fourth, and to the proprietor of the land one-third, of the annual produce of the pit; from which we learn that the right to work for coals or other metals in Belgium in feudal times was a seigneurial right, invested in the lord of the manor, not in the proprietor of the land. The history of the variations growing up in the usages and rights of different districts in the progress of centuries, is given by Lord de Walden, in a manner that must be very interesting, as regards the facts communicated, to the coal-owners and the coal trade generally of this country.

It cannot be uninteresting, however, to artisans to learn that in Hainault and Namur the right to work coal-seams was granted at the same time to three or four companies, who have been found working for coal within the same vertical limits. The inconvenience, confusion, and expensiveness of this cramped system of mining will strike every one here. It would be deemed impractical in this country, and, we believe, has never been attempted. Liege itself is free from it, and the plan is generally disappearing from Belgium.

It is curious, however, to find in Lord de Walden's report evidence of the existence of Co-operation in Belgium, certainly as early as four centuries ago. Such appears to be the facts, as stated by his lordship. As far back as 1297 and 1443, records, as we have stated, existed as to grants of rights of coal-mining; and his lordship states that "the first companies for working coal consisted of *mere associations of operatives.*" Some of these companies—for instance, those of "Belle et Bonne," "Turlupu," "Fosse du Bois," and others—still keep up their *original character,* and contain a large number of workmen who *have shares in the undertaking,* and who *consequently take part in the deliberations of the society.*" Here are all the features of practical Co-operation. This system was gradually changed at a period when Co-operative ideas were popularly supposed to have been first introduced into Europe—namely, after the Revolution of 1789. Only a short time ago it was a matter of public congratulation that Co-operation was about to be applied in this country to coal-mining. For a long time it was thought, and even still the opinion prevails, that it is a difficult or impossible thing to apply Co-operation to coal-mining. Coal-owners have doubted it, the public have questioned it, and even the trade unionists have shaken their heads at it. Only a few bold and intelligent colliers were found to have faith in it; and the Messrs. Briggs were much complimented for their intrepidity in making their experiment. Now we find that this is the natural condition under which the oldest existing industry was originally carried on. Had Lord de Walden's report been made a few years earlier—had the Foreign Office fortunately imported this knowledge a few years ago—instead of having only the Co-operative Collieries of Whitwood and Methley in existence, there would probably now be a dozen or more.

Very curious information, of which the unionist operatives in the coal-trade ought to be in possession, is communicated in the Foreign Office report in question. In 1851 there were 380 pits in the provinces of Liege and Hainault, and these 380 mines were worked with 41 open galleries for the extraction of coal. In 1862 the number of pits had decreased to 335, but the open-air galleries had increased to 56. In 1851 there existed 214 open galleries for the escape of water; eleven years later—that is, in 1862, these had increased to 335. The use of ladders, always unpopular with the miners, is made obligatory in many mines, from the frequent accidents arising from the use of cages, or "cuffats." Of late years, an apparatus, called the "warognière" (man-engine), for the ascent and descent of the pitmen, had come into general use in all the best-managed mines. There appears to be no invention such as that lately perfected by Mr. Broadbent, of Rochdale, in this country, for arresting the descent of cages by an ingenious and simple self-action on the breaking of the pit-rope or chain.

We find that police regulations are necessary to ensure the safety-lamps being locked before being delivered to the men. Belgium miners, like the English, are subject to what Lord de Walden very properly called "foolhardiness." In order to get a better light to work by, they would take the tops off the lamps, and blow up the mines and themselves too.

Another fact affecting the lives of workmen and the interest of collier-owners is, that up to 1840 the Davy lamp was the only lamp used, but at that time a Belgium engineer, M. Mueseler, brought out the lamp which bears his name, and which has now almost entirely supplanted Sir Humphry Davy's invention in the pits of Belgium. The objections urged against the Davy lamp were these:—first, that it was not always to be depended upon against every explosive combination of atmosphere; secondly, that an enlargement in one of the meshes of the iron network was

sufficient to cause an explosion where fire-damp existed in any quantity; thirdly, that when the lamp was exposed to draught, or moved rapidly, the flame might pass through the meshes and communicate with the explosive gas; fourthly, that a drop of oil, or a mixture of oil and coal-dust, adhering to the outside of the lamp, might become heated, and ignite in the midst of fire-damp; and, lastly (and this, perhaps, is the gravest objection to the Davy lamp), that its light, which is at no time good, becomes almost totally obscured after being some hours in the pit, from the meshes being choked with coal-dust.

M. Mueseler's invention, though constructed on the principle of Sir Humphry Davy's lamp, is said to be so far free from its disadvantages that it is perfectly free under all atmospheric combinations, even when its wire network is enlarged or broken; that it gives a light equal to that of two Davy lamps; that it burns less oil; and that it goes out when the flame is brought into contact with carburetted hydrogen, thereby giving warning of the danger.

On the other hand, it is heavier than the Davy lamp, and is apt to go out when placed on a slant or carried out of the perpendicular. This latter objection made the Mueseler lamp unpopular with the pitmen, especially in mines where the seams are irregular and on an incline, for the workman was at any moment liable to be left in the dark, even where fire-damp did not exist. Notwithstanding this fault, the Mueseler lamp, on account of its superior safety qualities, is now generally used in the Belgian collieries.

All over our mining districts at this hour, new lamps are being carried about, and ingenious men, like the self-taught chemist of Ruabon, are wasting great energies in perfecting improvements which the Belgian engineer has long succeeded in effecting. Lord de Walden's report, which has just been delivered to Members of Parliament, will throw valuable light on the Davy lamp question.

All this imported knowledge we extract from a single report of Her Majesty's Secretaries of Embassy and Legation on the Manufactures, Commerce, and Industry of the countries in which they reside. We have used only Lord de Walden's report on Coal, as found and worked in one country—Belgium; and our extracts are but a sample of the facts communicated. We leave it to our readers to say whether an item of "Imported Knowledge" is not as valuable to the people and operatives of these realms, as any imports of manufactures, raw or finished; and whether important results may not be accomplished, should the suggestions we have ventured to make be acceded to, and the same resident officials be instructed to report upon the conditions, laws, and usages of labourers, as well as labour.

The Temperance Question in its Industrial Aspects.

Whether man is naturally a lazy or labour-loving animal, is not a question with which we need embarrass ourselves on the threshold of this paper. By constraint, if not willingly, the great majority of men have to work to live; and it is to be hoped, for the credit of our humanity, that habit, our second nature, brings to the majority a contentedness in the prosecution of daily tasks which may, at first, have been more irksome than agreeable. We are by no means willing that so commodious and opulent a term as "industry" should be restricted to the industry associated with unskilled or even cunning handicraft; but the *usus loquendi* is tyrannical, and it is in vain to deny that the mention of industrial operations and industrial classes is generally connected, both by speaker and hearer, with the workmanship and workmen for whose particular interests this journal is conducted. It must be understood, then, that conforming for the present, at any rate, to this popular phraseology, we have an eye to that species of industry of which power, manual or mechanical, is the great instrument, and the increase of material wealth the principal intent. Such industry, in a highly civilised country, must be under the guidance of high intelligence; and though it differs from the industry that deals intellectually with ideas of beauty, scientific truth, and moral duty, its importance to the well-being of society is not likely to be overlooked. What the body is to the whole man, *that* material industry is to the whole community; and all good citizens are concerned both in its utmost possible development, and in its best possible effect upon the condition of the sons of industry themselves.

It may be assumed, as self-evident, that, in proportion as the Temperance movement is successful in separating the industrial classes from the love and use of strong drink, the injuries to industry arising from drinking and drunkenness will proportionally diminish. This may be assumed as being in accordance with the principle that the effect ceases with the cause, and as the well-attested result wherever the experiment has been tried. The love of intoxicating liquor and indulgence in it have, undoubtedly, much to answer for in reference to industrial enterprises and results.

First, an indisposition to labour is a very common effect of drinking tastes and habits. Men "on the drink" are on the strike against everything in the shape of honest industry; and this form of strike is, unhappily, too common to attract much attention. Saint Monday is still more than a name in the calendar of myriads of workmen; and tippling during working hours is not quite unknown in establishments, large and small, devoted to industrial pursuits. A calculation has been made, that the loss of time from drinking alone is equivalent to the surrender of one entire day a week on the average, or fifty-two days a year from the working-time of the working classes. The use of beer has long been notorious for its effect in producing an aversion to sustained action of mind or body, and the engendering of a heavy, apathetic disposition. This has been ascribed to the drugs said to be mixed with public-house beer, but some deeper cause is rather to be suspected. Aware of this tendency, some non-abstainers carefully avoid all use of strong drink till their day's work has been concluded. It will be observed that we are referring less to the drunkenness of intoxication, which puts a total stop, while it lasts, to industrial effort, than to the influence of much more measured potations.

Secondly, a great reduction of industrial operation is the necessary result of this drinking in all its degrees. If one day per week is lost to each workman (taking, observe, an average—some losing more, some less, and others little or none), the loss of work, in the aggregate, cannot be less than one-sixth, and the value of industry thus sacrificed, both directly and indirectly, must be immense. There is reason also for believing that, while the loss in wages is one-sixth, the loss to employers, and to the industrial wealth of the world, is even greater. Where the absence of men, through drink, stops the execution of important contracts, the injury inflicted is not to be reckoned simply by the time consumed in drinking. Punctuality is a power in business, and "the pot" is no friend to punctuality. Nor can it be denied that grievous injury is often suffered by very sober workmen through the tippling of others, without whose co-operation orders cannot be completed. Division of labour is an excellent principle; but when even a minority of the labourers are paying their devotions to Sir John Barleycorn, the result frequently is a serious subtraction from the work and wages of their mates. In this way, working men may, without intending it, prove bitter enemies to the interests of their fellows.

Thirdly, the quality of the work actually performed will suffer in some measure from the use of alcoholic liquors. Steadiness of nerve is impaired, clearness of judgment is diminished, and many a clever operative becomes prematurely disabled, because he takes into his mouth an enemy that steals away his power of employing his senses and intelligence. Besides this personal effect, men given to "potting" are apt to resort to "scamping" and other mean devices to make up for lost time. Industry mangled and marred is among the consequences of the drinking system.

Fourthly, the waste of life among the industrial classes from intemperance—not intoxication only—is very great, involving a heavy industrial loss; and, as thousands of children are annually destroyed by parental neglect, who if they survived would recruit the industrial classes, the total of loss from this source is greater than can be computed.

Fifthly, as the whole country is a sufferer by any large waste of industrial energy and skill, this sacrifice of industrial power and produce from drinking conduct is a national calamity; and the losses thus visited upon society can *never be repaired* by any subsequent addition to its industrial resources.

Window Plants and their Culture.

Window plants are almost universal favourites. They may be found everywhere—in places the most unlikely, and under conditions seemingly very unsuitable. But there are very few places where a real love for flowers will not succeed in making some plant grow. And what can be prettier than the constant presence of flowers and foliage, even the simplest; or more interesting than the constant change which is going on under our own observation, and almost under our control?

That many are deterred from growing window plants, either from ignorance, or the remembrance of past attempts and failures, or from a mistaken idea as to the expense, time, and trouble required to succeed, I do not doubt. I hope, therefore, to dispel such objections from the mind of any reader of these papers who may wish to try.

There are very few persons who cannot find time to give a half-dozen plants the necessary treatment to ensure their growing and flowering. A few minutes every morning will be amply sufficient for the care of a few, and when potting and putting cuttings down for fresh plants, and other operations, which will be pointed out, become necessary, any one who cannot find time to do them, may as well either pay, and get them done, or give them up altogether. As to expense, all depends on the way a person sets about getting the plants. If a constant succession of bloom is to be kept up, it can only be done regardless of that item; but if a few plants are grown, such as geraniums, fuchsias, begonias, verbenas, &c., there are very few persons who cannot procure slips of these, and by following the directions which will be given, rear from these slips, or cuttings, good flowering plants. There is the less difficulty in thus getting a stock of plants, as it is necessary to prune nearly all pot plants at times, so as to ensure a dwarf bushy growth and plenty of foliage; and these prunings are most suitable for growing young plants from.

To grow them successfully in rooms, there are some general rules which apply to the treatment of all pot plants. These shall be considered first; and then the plants that are most usually grown, and are most suitable, will be treated of separately and in detail.

In raising young plants from cuttings, or slips, care must be taken to have a portion of old wood attached. Cuttings are, as their name implies, small pieces cut off a branch; a branch may be cut, if long enough, into several pieces, and by cutting each of these pieces square off below a bud, and taking off the lower leaves neatly with a sharp knife, each of them will most likely grow. This method need only be followed when many plants of one kind are wanted. A slip is a very short young branch, slipped, or carefully pulled off from the main branch, or stem, on which it is growing; at the end which comes off, there is generally a little piece of bark, which peels off the main stem. This slip must be cut off, as if it be left on it often decays, and causes the lower portion of the slip to rot, and the whole is lost. Slips are most easily procured in spring, and verbenas, fuchsias, heliotropes, and several other plants, can be most easily grown from slips taken when about two inches long.

The great point to be aimed at in growing slips in spring, is to keep them from withering at all. Let them be planted carefully in well-drained pots, get a good watering, and then cover them with a bell-glass, or even an old tumbler, and put them in some warm place. Carefully watch for diseased or yellow leaves, cutting them off immediately they appear. Keep the plants from flagging, from want of moisture either at the roots or in the air in the bell-glass. Let them have fresh air once or twice every day, and always use tepid water, the cold just taken off, so that they may not be checked, and in a short time the little slips will be growing nicely. They may be grown separately, or four or five may be placed in one pot round the edge. To prevent the pots getting dry, the best plan is to sink them in a box with sand in it, which will prevent

evaporation, and keep the soil in all the pots uniformly moist; or, if there is but one pot filled with cuttings, place it in another, about an inch wider every way, and fill the space between with moss or sand, and keep all damp.

Cuttings of pansies, fuchsias, chrysanthemums, and many others, will grow if they are placed in small phials of water in the sunlight; they will send out clear white rootlets, and may then be transplanted. Several may be grown together in a deep saucer filled with sand, and water poured in till it rises on a level with the top. A number of short cuttings placed in the sand, and covered with a bell-glass, will very quickly strike.

When potting separately the plants obtained from these cuttings, care must be taken to have the pots nice and clean, and to have them soaked in water for a short time beforehand. The earth used in potting must be rather dry than wet, and if close and heavy will be improved by having a little sand mixed with it. A little *well-decayed* manure placed above the drainage, and then covered with some earth, so that the roots may not touch it at once, will, for strong growing plants, be very useful. It is very necessary to secure good drainage in the pots: to attain this end, place over the hole in the bottom a piece of rough slate or an oyster-shell with the curved side uppermost, over this lay some pieces of a broken pot or some lumps of charcoal, then some more lumps still finer, and over this place the manure and earth.

There is nothing conduces so much to the health of plants in pots as care in regard to watering, and keeping the leaves in a clean state. Plants perspire greatly, and anything that stops the pores, with which the leaves are thickly covered, will soon destroy the leaves and they will fall off. Nothing looks more dismal than a geranium or fuchsia with a half-dozen bare branches, and a few leaves on the top of all. A plant well furnished with leaves looks nice even when out of flower, and nothing shows off the flowers to greater advantage than the background of green leaves which the plant, if well treated, will produce so abundantly.

In order to keep the plants healthy and covered with leaves, they must be either protected from dust, or else have the leaves frequently sponged with slightly warmed water and a piece of very soft sponge. If your plants have not been accustomed to such treatment, try it for once, and you will be surprised at the colour of the water when the operation is complete, as well as at the improvement in the appearance of the plant.

Care in watering chiefly consists in *carefully* supplying the *wants* of the plant. Every plant requires water in a different proportion, and at different seasons the same plant requires to be differently treated. The only treatment that will maintain a cactus in a flowering state is to keep it nearly dry from the time it has done flowering until the spring comes round again, when, for a couple of months, it must be supplied freely with as much water as it wants. This is just the treatment it receives in its native place. If a geranium is treated in the same manner, what will be the result? If a geranium and a cineraria are treated in the same manner, say about January or February, when the latter will be coming into blossom, the geranium, on getting as much water as the cineraria *requires*, will drop all its leaves, while the amount of water that would keep the geranium healthy, will leave the cineraria with withering leaves, and it will be quickly covered with green insects. Of course, any one will see that three such different plants require different treatment; but I want the principle that may be drawn from these experiments to be applied in every case, and, noting the peculiarities that will be seen to belong to each plant, treat each one differently. Plants always require more water when flowering than when they are at rest; they require generally a season of rest, after a while they begin to grow, then they must get water enough, and flowering is the final result—the perfect state, if it may be so called, of the plant. And, as most plants flower in the summer and autumn months, they require more water in these seasons than in winter, when they generally are at rest. Plants seem to be best suited when they receive a copious watering when *necessary*, be it seldom or often. "A little and often" is a very bad rule. The water is better with the chill taken off it, for the earth in the pots is of the same temperature as the air of the room in which they grow, and every application of cold water gives the plant a check which more or less injures it, and renders it subject to the attacks of insects.

Combinations of Employers or Employed.

We supplement our recent articles on the law relating to employer and employed by a statement of its provisions with regard to strikes, and combinations of both masters and workmen for trade purposes. We are glad to observe that working men have taken a great interest in the subject of these articles, and that, at the solicitation of the Working Men's Association, Lord Elcho has lately obtained a select committee of the House of Commons to inquire into the entire law affecting master and servant. Such an inquiry will doubtless lead to some useful results, for in many respects the law is admittedly imperfect. It has not been our purpose to point out its imperfections, but our readers will form their own judgment upon them from the summary we have given.

The origin of our law relating to combinations of workmen is curious and remarkable. In the reign of Edward III. a severe pestilence carried off a large number of the people, and the consequence was that the surviving labourers obtained a much higher remuneration than before. An Act of Parliament was soon passed to check the rise in wages, and this enacted that labourers should thenceforth receive only such remuneration as was common in the districts where they resided before the plague broke out. This Act, passed in 1350, is known as the 25th Edward III., cap. 1.

A great deal of dissatisfaction and dispute naturally arose under this enactment, and two years after a Statute of Wages was passed, which fixed the amounts that should be paid to labourers and ordinary artificers. Other acts were subsequently added to enforce compliance with the provisions of this statute. In 1425, mediæval legislation on the subject was crowned by an Act (3 Henry VI., cap. 1) which made it felony* for masons to combine together to obtain an advance of wages above the statute rate. In more enlightened times this law fell into disuse; but it may surprise our readers to learn that it was not erased from the statute-book until 1824.

At the close of the last century a statute of wider scope, though less severe in its penalties, was passed against combinations. This is known as the 39 and 40 Geo. III., cap. 105. At the present day this appears, also, to be an enactment of the Middle Ages, for it prescribed that any workmen who should enter, either verbally or in writing, into combinations for the purpose of obtaining an advance of wages, or similar objects, should be punishable by imprisonment for three months, or by committal to a house of correction for two months, with hard labour. The oath of even one witness, before two justices of the peace (who might possibly themselves be employers of labour), was sufficient to secure conviction.

The effect of this law was to prevent open combinations, but, at the same time, to increase those of a secret and far more mischievous character. The working classes, having no chance of remedy for any trade grievance by united action in public, resorted to private conspiracy, and indulged in frequent and lamentable acts of violence. It became the general feeling that such a state of the law did more harm than good, and, therefore, a bill was carried through Parliament for the repeal of the existing statutes, and a new Act was passed—the 6th Geo. IV., c. 129—which, with an explanatory Act of 22nd Victoria, forms the present law on the subject.

Under this Act of 6th Geo. IV., it is lawful for any persons to meet together for the purpose of consulting and agreeing as to the rate of wages they shall demand, or the hours they shall work. They may also enter into engagements, written or verbal, among themselves, for the purpose of fixing such wages or hours of work. Masters, also, may meet and agree in the same manner as to the wages they will give, and the rules they will adopt as to hours of labour.

But, although liberty is thus given to any number of men to arrange the conditions under which they will labour, or to confer as to alterations they may desire, there are stringent provisions in the Act against any attempt to enforce their own views, in any way whatever, upon other workmen. Any person who, by violence or threats, endeavours to force a workman to leave his employment, or return his work unfinished, or who endeavours to prevent a workman from being hired, or from accepting work, is subject to imprisonment, with or without hard labour, for any term not exceeding three months. The same penalty is enacted for the use of violence or intimidation for the purpose of inducing a workman to belong to a club or association, to contribute to a fund, to pay fines or penalties, or to comply with rules affecting wages or the hours and quantity of work. And any one endeavouring to force a manufacturer, or other person engaged in business, to alter his mode of carrying it on, to limit the number of his apprentices, or to change the description of his workmen, is also liable to the same punishment.

Powers are given to two justices of the peace to enforce the provisions of this measure; but neither magistrate must be engaged in the particular trade in which the dispute has arisen. Their decision may be appealed against at the quarter sessions. In London, a metropolitan police magistrate may adjudicate on questions arising under the Act.

A later statute makes assaults arising out of any combination for the purpose of raising wages, &c., specially punishable by hard labour.

Since combinations of workmen have been permitted by the law, strikes have ceased to be illegal in themselves. Every one is at liberty to labour, or refrain from labour, and to concert with others as to the conditions under which they will work, or cease from working; but it must be clearly understood that the slightest attempt to coerce another to leave his employ, or to abstain from accepting work, or to work under any other conditions than those which he himself may select, is an offence punishable by the law. Violence is not held to be necessary to this coercion; intimidation, obstruction, or molestation of any kind, is sufficient to incur the penalties of the Act.

We must reserve for another paper a few instances of the application which has been given to the Combination Laws in the cases of both employers and workmen, with the provisions for Arbitration between them.

* Felony is the highest class of crime known to the law, and although it did not necessarily involve the punishment of death, as sometimes erroneously supposed, it entailed the forfeiture of property and goods, in addition to the prescribed punishment for the offence itself.

LABOUR.

There's a never-dying chorus
  Breaking on the human ear,
In the busy town before us
  Voices loud, and deep, and clear.
This is labour's endless ditty;
  This is toil's prophetic voice,
Sounding through the town and city,
  Bidding human hearts rejoice.

Sweeter than the poet's singing
  Is that anthem of the free;
Blither is the anvil's ringing
  Than the song of bird or bee.
There's a glory in the rattle
  Of the wheels 'mid factory gloom;
Richer than e'er snatched from battle
  Are the trophies of the loom.

See the skilful mason raising
  Gracefully yon towering pile;
Round the forge and furnace blazing
  Stand the noble men of toil.
They are heroes of the people,
  Who the wealth of nations raise;
Every dome, and spire, and steeple
  Rear their heads in labour's praise.

Glorious men of truth and labour,
  Shepherds of the human fold,
That shall lay the brand and sabre
  With the barbarous things of old.
Priests and prophets of creation,
  Bloodless heroes in the fight,
Toilers for the world's salvation,
  Messengers of peace and light.

Speed the plough and speed the harrow;
  Peace and plenty send abroad;
Better far the spade and barrow
  Than the cannon or the sword.
Each invention, each improvement,
  Renders weak oppression's rod;
Every sign and every movement
  Brings us nearer truth and God.

J. Rushton.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

Workmanship.

It is certainly a matter of satisfaction to see, from the letter of the Secretary of the Metropolitan and Provincial Working Classes' Industrial Exhibition, which appeared in No. 13 of this journal, that a silver medal, placed at the disposal of the Committee of this Exhibition by the liberality of Robert Murray, Esq., F.S.A., of Kimahaird, Ross-shire, is to be awarded to the most ingenious contriver of a very useful and much-needed domestic machine, suggested by one of our correspondents. We restrict ourselves in this article to the question of workmanship, so allied to ingenuity. Ingenuity, which implies, and indeed includes inventiveness, is properly singled out for reward, it being a higher quality than skill. Workmanship implies skill, which is no mean qualification; but it also implies more than mere skill. Workmanship implies finish and thoroughness, and these are qualities that every man can compass. In daily life every man cannot attain to eminence, but he can to honesty; he may never acquire gracefulness, but he can vigour: so in industry, a workman may miss inventiveness, or lack skill in the sense of fineness of work, but he may attain to thoroughness, the essential quality of workmanship.

The value of workmanship may be well illustrated by what occurred at the first Great Exposition of Industry at the Crystal Palace, opened in Hyde Park in 1851. The majority of articles exhibited there were chiefly designed for effect. Nearly all articles were showy. Many, indeed, were excellent. In design and finish, multitudes of objects commanded and deserved admiration. But a far greater number, admirable for pattern, for novelty, for newness of contrivance, for originality of adaptation, were wanting in durableness. They were not put together in a lasting manner. So far as the fault lay in the material used, the firm who sent or caused inferior materials to be used were responsible for that, and not the artificers who worked them up. The point we have in view is the workmanship—the way in which the materials are used, the manner in which the articles are put together.

For instance, in the department of iron and steel manufactures, there were fire-grates of a very handsome pattern; but if you examined them closely, you found that the cast-iron plates of which the frames were composed, were not perfect. There had been sand-holes in them, and these holes had been plugged up, and the places showed like small white stars on what is techuically called the "dead white" of the surface. The steel portions were imperfectly burnished. Either the burnishing tools, which it requires peculiar ability to make, were defective, or the steel was imperfectly prepared, or the burnisher himself was not master of his art. Only very skilled workmen can burnish a plane of steel. In fine, there was a want of workmanship apparent in many of these articles, and the reputation of the town sending them suffered in proportion. If you looked behind some of these articles in bright iron, you perhaps found had fitting, which rendered the stability of the structure insecure. The threads on the screws were weak, or the nuts were badly tapped, or were too thin, or the pins and staples were too long or too short, were wastefully made, were ugly or insecure. True, all these things were out of sight, and therefore thought unimportant. But the quality of the workmanship is shown by the state in which work is left which is out of sight, and the quality of the workman's mind also. His economy in the use of material, his taste and workmanly thoroughness, are shown in these small things. Though small, they are not unimportant. The durability, the lasting quality of the article constructed depends upon these things. A steel fender, for instance, in which these little neglects occur, may be a very beautiful object to the eye, but it would give way on the very first accidental kick it received, and which it would be sure to receive before it had been in use long. The fall of a poker upon it would indent it and make it "start," and its parts become loose.

Articles of cabinet-work, of carving and gilding, were in many cases open to similar criticism. Every person unfortunately has experience which will enable him to understand this. Chairs, sofas, bedsteads, in household use, continue to give way, in use or removal, in a most provoking and expensive manner. A picture or looking-glass frame becomes shabby in an unexpected way. Damp or stains affect them, and spoil them before half their time of duration has expired. Any man who has visited an old ruin, and examined it curiously, has found that the old workmen had a thoroughness about them which is now rarely met with. In the curious carving of old temples—in Melrose Abbey, for instance—the back of the foliage, the rear of the curious leaf, or grotesque figure, there is the same care and finish, as far as possible, as in the parts which meet the eye. Like the creations of Nature, every part of the work is perfect; so that the entire association of ideas about it is wholesome and satisfactory to the mind. This is the result of workmanship—a far higher quality than is generally supposed.

At the last International Exhibition many noble articles of manufacture were entirely spoiled through subsequent treatment, and want of a sense of manufacturing taste. There were a set of splendid steel bells, of novel material and great perfection of workmanship, which the exhibitor painted after they were suspended, hiding all the glory of the texture and polish of the steel. There was a magnificent anchor of most graceful shape; its very massiveness and stupendousness had been made a thing of beauty by the well-directed strokes of the forgers. Every blow was a work of skill, and the sign of it a thing of pleasure to trace. This, too, by some imbecility of judgment, had been painted, so that all the pleasure of the rare workmanship was lost. The forging of the anchor has been the subject of one or two noble paintings, and of one of the most spirit-stirring poems in our language. The anchor of which we speak, was of itself a poem of manufacture; and it was almost a grief to find the splendid texture of the wrought iron painted out of sight.

In articles of wood-carving and cabinet manufacture, the greater part are far more beautiful as they leave the workman's hands, with the mark of the plane and the chisel upon them, than ever they are when trea cherous polish has touched them. The commonest wood, with the bloom of labour upon it, is far daintier to the eye than any veneering can make it. The sculptor's work would be ruined if his marble statues were painted. And, as Mr. Ruskin puts it, "an honest brick is far more beautiful than any stucco."

We may some time speak of the waste of money and poorness of result which working men achieve in furnishing their own houses. They, at least, might set custom at defiance, and create a new style of house comfort, were they inspired with the true feeling of simplicity and durability. We make these suggestions for the consideration of many of our readers and correspondents, who are interested in the improvement of Working Men's Industrial Exhibitions. Workmanship and taste are qualities which every contributor could, in varying degrees, display; and these should be watched for, discerned, commended, and rewarded.

The London Tailors' Strike and Lock-out.—The conflict between the London employers and the operative tailors has terminated in an agreement, binding on both parties, being drawn up, by which the men are to receive the advance of one penny per hour, yielding, at the same time, some minor claims made by them. The struggle was a peculiar one, and its progress proved that capital and labour are not always and at all points unequally matched in contests of this kind. From the first the masters were completely defeated in their endeavours to fill their shops with foreign labourers. The telegraph wires were early put in operation by the working tailors' committee; and the agents of the masters, sent abroad in search of workmen, found their persuasions futile, because too late. The locked-out tailors became jubilant at their success, and naturally looked for a speedy settlement of the dispute—of course, to their own satisfaction. The *Pall Mall Gazette*, contrasting the rates of wages received by the artisans in towns with those obtained by labourers in the country, observes:—"The better class of men who are employed as carters or shepherds, and still more those really skilled labourers who are needed in the use of farm machinery, and who earn from fourteen to fifteen or sixteen shillings a week all the year round, though working very short hours in the winter, cannot be put down as really costing their employers much less than fourpence per hour, considering on how many days the value of their labour is diminished to a formidable extent. Compare, now, these scales of payment with those of which town workmen are now complaining, and which masters are, for the most part, defending. At the largest tailoring house in London, the very best workmen have been earning sixpence per hour; and the Scotch shoemakers have been earning, in Edinburgh, less than threepence-halfpenny per hour. Whether, under these circumstances, their strikes are prudent for themselves, or mischievous to the public, we do not now discuss; but the real facts should be borne in mind, with the additional consideration that strikes and combinations of all kinds cannot possibly resist the operation of necessary economical laws. A rise in wages, whether or not it be the result of a strike, means simply a rise in the price of the complete manufactured article; which again means simply a diminution in demand on the part of the consumer. Things must, therefore, inevitably adjust themselves, and the duty of the law is to see that no violence be imported into the contest between capital and labour."—[Perhaps some of the readers of the Working Man may feel inclined to favour us with their views as to the possibility of the present general rise in wages being permanently maintained.—Ed. W. M.]

Hope for the Spitalfields Weavers.

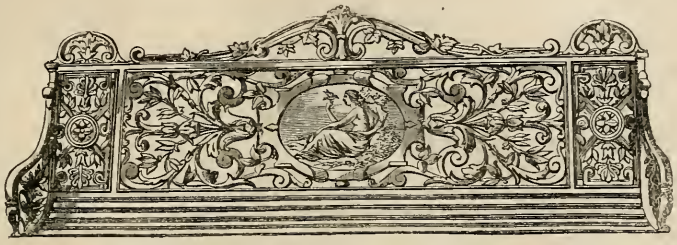
We are glad to see that practical Co-operation has at length made its way into London. Co-operative stores are highly useful contrivances, and we have borne frequent testimony to the lesson they teach and the good that they do. But the form of *manufacturing* Co-operation is yet more important, and implies the attainment of higher qualifications on the part of those who engage in it. Nowhere is the ameliorative influences of Co-operation more needed than in Spitalfields and Bethnal Green. The condition of the silk weavers in these districts has been for two generations a blot upon the metropolis. Statesmen have deplored it, and the Court has more than once endeavoured to effect improvement by setting the fashion of wearing the productions of these ingenious artificers. But improvement in trade seldom brought much relief in the way of improvement in wages. Fashions are proverbially fitful; no human power can make them permanent, and the silk-weaving trade has again relapsed into its chronic condition of badness.

Co-operation has now come to its aid, and promises a relief more effectual and permanent than had hitherto been thought possible. A crowded meeting has been held in the Union Hall, Parliament Court, Artillery Street, Bishopsgate. Numbers could not obtain admission, so eager were the operatives to take part in the proceedings. This is a sign as creditable as it is hopeful of success. The object of the meeting was to form a Spitalfields Co-operative Manufacturing Company, under the Limited Liability Act of 1862. Messrs. W. Fithian, R. Nichols, Du Cane, Delaforce, Holland, and others, delivered speeches in explanation of the proposed plan. At the present time the broad-silk weavers are practically compelled to work fourteen or fifteen hours a day to earn the average wages of ten shillings a week.

It is calculated that by forming a Co-operative Company they will earn, at least, £1 a week. The capital of the company is fixed at £100,000, divided into 100,000 £1 shares. As is usual, five shillings a share is to be paid on application, and a second five shillings on allotment. The weavers who take shares will have the option of paying one shilling per share at the time, and 20,000 shares will be reserved for them at par. In order to enable them to pay their shares they will be given work by the company, who undertake to pay an average on all descriptions of fabrics of 25 per cent. over what they are at present receiving.

We congratulate the broad-silk weavers on the prospect thus open to them. Mr. Du Cane said that, from calculations he had made years ago, he was satisfied that the weavers could get a rise of 75 per cent. on their wages instead of 25. Mr. Delaforce confirmed this opinion. He said that the Germans could not drive them out of the market, as the low velvets were actually higher in Germany than they were in Spitalfields, while the German yard was only equal to their three-quarters of a yard. Again, in France the price paid per yard for labour was more than in Spitalfields; and how, then, could the French manufacturers run them down?

The promoters of the proposed company think that they can get to work in a few weeks. At the conclusion of the meeting it was announced that those who wished to take shares might then come forward and sign the application, when a perfect scramble took place to get to the platform for this purpose. We shall look forward with great interest to the plan of the management and the organisation of the company.

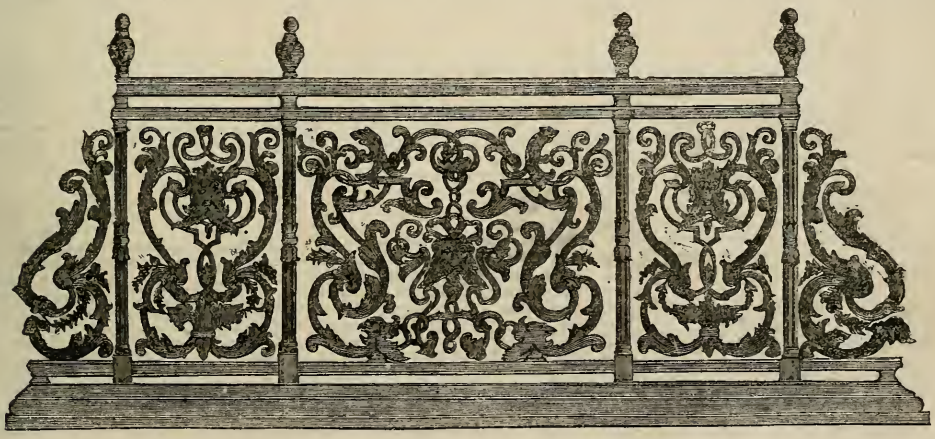


Art Designs

FOR USE IN TRADES AND MANUFACTURES.

ORNAMENTAL IRON-WORK.

Before Quintin Matsys abandoned the forge for the palette, he had already achieved a reputation for the tasteful character of the ornamental iron-work which he fashioned into shape with the strokes of his heavy hammer. But he did not stand alone in skill, for his was a time when much that was of an ornamental character was considered an indispensable adjunct to even the commonest article made of iron. In after years, the ornamental character of much of the iron-work produced underwent a marked change. It became formal and poor in style to an almost incredible extent, especially in England, where the use of ornament in iron-work was almost, if not wholly, unknown. The Great Exhibition of 1851 produced a revolution in this direction. Our metal-workers beheld what was being done by their Continental rivals, and hastened to emulate them. The change has been felt in every branch of the iron trade, especially in those connected with the production of articles of daily use. The two illustrations given by us indicate, so far as they go, the union of utility with taste, which now forms not the least promising feature in modern metal-work. The first represents the upper part of a garden-seat, and the second a portion of some railings.



The Bessemer Steel Works at Piombono, Italy.

The Magona d'Italia Bessemer Steel Works at Piombono, erected by Messrs. Novello, Pousard, and Gigli, the patentees in Italy, have been wholly built and furnished with the most complete modern machines within little more than a year, and they were inaugurated on the 11th of March by a public festival, which is described in very glowing terms by the Italian journals. Prince Amadeus, son of the King of Italy, is known for the intelligent interest he takes in manufactures in general, and in this establishment in particular, and he signified his intention to preside personally at the *festa*; but the recent death of his brother, Prince Oddone, preventing his appearance on a festive occasion, he deputed the Marquis Torelli to represent him, and make an official report. More than a hundred persons distinguished in parliamentary life, in science, and in engineering gathered from distant parts of Italy, and declared themselves well repaid by the magnificent spectacle of the conversion of three tons of molten iron into steel by the Bessemer process, and expressed their surprise at finding such extensive works in active operation, where but a few months before the corn was growing.

The geographical position of the Magona d'Italia proves to have been most judiciously selected. It has enabled the proprietors to overcome many of the natural disadvantages inherent to the making of iron and steel in Italy. About a thousand yards of frontage along the shores of a natural harbour, on the site of the ancient Porto Faliegi of classical history, have been purchased for the Magona d'Italia. The rich iron ores of Elba, the charcoal produced in the woods along the coast of the Tuscan Maremme (marshes), and the lignites dug in the neighbouring hills, can be landed direct on their own premises at a quay constructed by the firm. A very short branch rail from La Cornia station of the Maremme Railway has been approved by the provincial council, and will shortly afford new facilities of access. The Magona d'Italia being in the midst of a hilly promontory, is exempt from the summer marsh-fever, which compels the closing of the Royal Iron Works at Fallonica from June to November in each year.

Italy has no native deposits of bituminous coal, although lignites and other mineral fuels are worked in the hills bounding the Maremme, which are serviceable for secondary purposes. Good iron ores are found in many Italian provinces, and Tuscany is especially favoured with abundant mines of the purest and richest iron ores in the world. Those on the island of Elba are worked at five chief points, at Rio Albano, Vigneria, Rio Marino, Terra Nera, and Calamita. At Calamita the iron is highly magnetic. The ores from all

these mines are especially adapted for the production of steel; and of the mines, those at Rio Marina are the most ancient and most important.

The method of working these mines—or rather quarries, since they are open excavations in the mountain-sides—is in the most primitive style, and capable of much improvement, while considerable outlay would be necessary to improve the access to the rugged coast of the island.

At the Magona d'Italia only one blast-furnace is as yet in blast, but the hydraulic lift and tower for charging have been prepared to supply a second. Vegetable fuel alone is employed, and the crude (or cast) iron is obtained from the ore in the usual manner. When the blast-furnace is tapped, the crude iron is run direct, and while still hot, into the convertors, as proposed by the inventor, thus avoiding the cost of re-heating—an especial economy in Italy, where fuel is costly. We believe that it is at the Magona the direct making of steel has been for the first time fully carried out. By careful attention to the levels on which the blast-furnace and convertors have been erected, the molten stream flows direct, in a glowing rivulet, falling at once into the mouth of the convertors. This direct method is made possible by the great purity of Elba ore, and the "make" can be regulated so as to be precisely of the quality best adapted to the Bessemer process. It has also been found that the proportion of decrease between the produce of finished steel and the weight of crude iron employed, compares favourably with the results of English and French makers. The flames from the blast-furnace and re-heating ovens are carefully economised by passing through vertical or horizontal boilers, and the steam thus produced gives motion to the blast-engines (two), hydraulic pumps for the rams, and numerous steam-hammers, of varying sizes, capable of dealing twenty-five-ton blows each, down to the handy and quick-repeating strokes adapted for light work. Nine of these are already actively extending the daily produce of steel ingots, amounting now to about six tons, with the expectation of early increase to twelve and fifteen tons, as fast as more hammers and rolling apparatus can be got in their places.

The present demand for steel for agricultural implements, with warlike and other stores for Government, is much in advance of the actual production, and there is, therefore, every probability of a speedy extension of the works which have already given employment and prosperity to the inhabitants of Piombono, besides greatly augmenting its population by the workmen and their families drawn together from other places.

The proprietors comprise in their firm one Englishman, a Frenchman, and an Italian, happily characterised at the inauguration as uniting the commercial qualities of the three nations—capital, ingenuity, and industry; and we may join with the visitors to the *festa* in wishing them a successful career.

The Textile Manufactures of England.

BY WILLIAM ROSSITER, FELLOW OF THE WORKING MEN'S COLLEGE.

III.—FIFTEENTH, SIXTEENTH, AND SEVENTEENTH CENTURIES.

For nearly the whole of the 15th century the rival families of York and Lancaster struggled for the throne of England. The feudal power of the land was divided against itself. Great lords, such as Westmoreland, Somerset, Buckingham, and Exeter, on the one side, strove against the still greater lords of Warwick, Salisbury, and Northumberland on the other; each party trying to set up a king of its own faction; each deserting and trying to depose him it had set up as soon as he attempted to be a king and not merely a partisan. It was in this strife, out of which came good for England, that the feudal system of the country wore itself out. It was during this strife that, though spinning and weaving languished, the spinner and the weaver acquired fresh energy; though trade was feeble, the trader became strong.

During the 15th century, the woollen is still the great English textile manufacture. English wool is still the best, but the Spaniards and Flemings still make the best cloth. England sends a great quantity of wool and coarse cloths in exchange for the fine cloth of these two countries, and the Spaniards buy, in return, not only English wool, but, whenever they can, English sheep as well. Silk is still brought entirely from abroad, and cotton is still almost entirely unknown.

In the 16th century the manufacture of silk commences on a small scale, and for small goods only, such as ribbons, girdles, laces, &c. The broad silks for dresses and robes is still brought from France and Italy.

The Netherland (or Flemish) trade in weaving was almost destroyed in the time of Elizabeth's reign. Philip II. of Spain was, at that time, also King of the Netherlands, and endeavoured, by every possible means, to root out Protestantism from every part of his dominions. The Netherlanders revolted against his tyranny, and he attempted, by force of arms, to suppress both their rebellion and their religion. The cruelties of his troops induced great numbers of the weavers to leave the country altogether, and Elizabeth, imitating the policy of Edward III., gladly received into her country many of those whom she had already helped with money and arms in their own country.

By the end of the 16th century, the trade of England was both flourishing and systematised. The Royal Exchange, in London, was opened by the Queen herself, and the trade of the country was encouraged by Elizabeth in every way. The trade with other countries became more direct, and less through the medium of foreign merchants. England, instead of being one of the supporters of the central trades of the Hanse Towns and of Venice, began to be herself one of the chief centres of commerce. The towns of Coventry, York, Norwich, Worcester, and Exeter, began to be important manufacturing centres, and Bristol, Southampton, and Hull to be important ports.

The 17th century was a period of great national activity, commercially as well as politically. The national energy expressed itself in founding colonies, and in organising great trading companies for commerce with the East Indies, with Turkey, with Russia, and with America. The treasures of the East, the silks and spices of the Indies, were no longer doled out to us by the merchants of other countries, but brought hither by our own merchants in our own ships, and fabulous profits were made upon the ventures.

Raleigh and others brought from the West articles of food of which before England had had no thought. Things now of commonest use, which we use almost every hour, were then seen for the first time. Potatoes, sugar, coffee, tobacco, were then counted amongst the wonders brought from the new continent.

The new position that England took as a great centre of the world's commerce was expressed in the navigation laws of this period endeavouring to confine English trade to English sailors and to English ships. The country put itself still more in order, established a Post Office for conveyance of letters throughout the kingdom, a New River to supply its capital with fresh water, and by the early part of the 18th century it had a Bank of England to manage its finances, a Board of Trade to regulate its commerce, and a new and intrinsic coinage to enable its merchants to deal one with another.

Wool was still the great textile fabric of England. It needs the constant repetition of this statement to bring home to us how old is the weaving of wool in this country, and how new the weaving of silk and cotton. The silk trade became, during the 17th and 18th centuries, gradually of more and more importance. Towards the end of the 17th century England received still another immigration of foreign weavers, also, like the Dutch, driven from their homes by religious persecution. A century of religious war in France had terminated, in 1589, by the accession of Henry IV., the champion of the Protestants, who, though he became Catholic himself, gave legal protection to his Protestant subjects. In 1685, Louis XIV. revoked this toleration, and gave the Protestant people the choice of exile or conversion. Some 300,000 chose to leave their country in preference to giving up their faith, and England offered them welcome. Of these, very many were silk-weavers from Lyons, and to them is owing great improvements in the silk manufacture and trade of their new country.

*Mortality in Different Occupations.**

I.—MINERS (*continued*).

The Report of the Royal Commission which was appointed in 1863, to inquire into the means of improving the health and safety of persons employed in mines, contains most elaborate and complete statistics relative to the mortality amongst miners in certain parts of the country.

From that report we have compiled the following table:—

ANNUAL RATE OF MORTALITY IN THE THREE YEARS 1860—2, AMONGST MINERS IN EACH OF THE FOUR GROUPS OF MINING DISTRICTS.

Ages.	Deaths annually to every 1,000 Miners living.			
	Cornish Districts.	Staffordshire Districts.	Durham and Northumberland Districts.	Merthyr Tydfil District.
15—25	9·4	8·3	10·8	13·2
25—35	9·6	9·5	10·9	13·8
35—45	15·1	14·0	11·8	16·2
45—55	29·7	21·0	15·9	21·7
55—65	63·2	50·1	32·6	45·9

It is clear that from some cause the mortality amongst the metalliferous miners of Cornwall is very much greater than the mortality of the coal miners of Staffordshire, Durham, Northumberland, and Merthyr Tydfil at the advanced ages. A comparison of this table with a similar one for an earlier period (1849—53) shows that very little change has taken place in the Cornish districts, save that the death-rate has increased at the three first ages, and declined from 34 to 30 per 1,000 at the age 45—55. In the Staffordshire districts the death-rate has fallen perceptibly at all ages under 55. In the districts of Durham and Northumberland, there is an increase at the three first ages. In Merthyr Tydfil the rate was, in the first period, 21, 20, 24, 34, and 57 at the different ages, so that there, at least, a marked improvement is manifest.

There may be many disturbing elements, however, to render the comparison between the mortality of persons of cognate occupation, but otherwise differently circumstanced, of no practical use. But no exception is fairly tenable if we take men inhabiting the same districts and living under precisely similar conditions in everything save the difference involved in occupation. Adopting this standard, the precise amount of influence which occupation exercises upon health will be at once apparent.

The following table, then, shows the death-rate amongst men of similar ages and inhabiting the same districts as the miners referred to in the previous table, and who are therefore exposed to similar influences of climate, &c.:—

ANNUAL RATE OF MORTALITY IN THE THREE YEARS 1860—2, AMONGST THE MALES OF ALL OTHER OCCUPATIONS (EXCLUDING MINERS) IN EACH OF THE FOUR GROUPS OF MINING DISTRICTS.

Ages.	Deaths annually to every 1,000 Males of the Non-Mining Population living.			
	Cornish Districts.	Staffordshire Districts.	Durham and Northumberland Districts.	Merthyr Tydfil District.
15—25	7·5	5·4	7·2	6·8
25—35	8·3	7·1	7·5	10·2
35—45	10·1	11·4	10·2	13·0
45—55	12·5	18·4	16·2	15·9
55—65	20·0	34·0	26·0	41·1

It will be observed that the difference between the two rates is not so excessive at the earlier ages, which proves that the causes which give rise to the high mortality of the miners, as compared with the non-mining population at subsequent ages, are slow in their operation. The seeds of disease are no doubt sown in the beginning, but their effects are not developed until the mischief is irreparable.

The evidence given before the Commissioners all goes to show that the Cornish miner is peculiarly the victim of disease engendered by the bad sanitary conditions under which his daily work is carried on, for it is stated that if deaths by violence be excluded, the mortality of miners in the

* Continued from page 199.

coal districts of Durham, Northumberland, Staffordshire, and South Wales is *below the average mortality* of those districts; thus proving that mining is not necessarily an unhealthy occupation.

It would carry us beyond the fair limits of our space to discuss the particular results for each separate group of districts; but as a practical commentary on the foregoing, we subjoin an illustration of the effect which the high mortality of Cornish miners has on the premiums they would have to pay for the insurance of their lives, as compared with those chargeable on the life of an average Englishman.

NET ANNUAL PREMIUM TO INSURE £100.

Age.	63 Healthy Districts. Males.	England. Average Male Population.	Cornish Miners.
	£ s. d.	£ s. d.	£ s. d.
20	1 7 7	1 12 5	1 17 6
25	1 11 0	1 16 7	2 3 2
30	1 15 1	2 1 8	2 11 0
35	2 0 3	2 8 1	3 2 0
40	2 7 1	2 16 2	3 16 11
45	2 16 1	3 6 8	4 16 2

The chances of life of the dwellers in the sixty-three healthy country districts are of course greater than those of the average population, so the premium required for the insurance of life is necessarily less from the former. But the increased risk attaching to the Cornish miner's life requires that he should pay a much higher premium than either of the other two classes, to an extent which is rapidly augmented with every advance in the period of age.

We very earnestly commend these facts to the consideration of all who are concerned in the mining industry of Devon and Cornwall—employer and workman alike—in the hope that they will be induced to take such steps as shall remedy the evils which now give to their localities such bad pre-eminence. They will find their account in such a work far more than in strifes and dissensions, which all tend to aggravate whatever is unfavourable in their condition.

Facts and Memoranda.

The area of the South Staffordshire coalfield is ninety-three square miles, and it is estimated that the coal will last 120 years.

As many as 100,200,000 tons of water pass over the Falls of Niagara every hour.

It is estimated that a ton and a half of water falling one foot per minute will grind and dress a bushel of wheat per hour.

Good ash has a tensile strength of 12,500 lb. to 17,000 lb. to the square inch.

The fall of the Thames between Chertsey and Teddington Lock, is nearly 17½ in. in a mile. That of the Nile, from the foot of the first cataract to the sea, is 0·525 ft. in a mile.

Squares of gold-leaf have been obtained so small, that three billions eight hundred and forty million of them would occupy no more than a single square inch; and yet each one would be visible under the best objectives of modern microscopes.

In the Lancashire mines the increase of temperature is 1 deg. for every 51 ft. of perpendicular depth; in those of the north of England, 1 deg. for 48 ft.; in Saxony, 77 ft.; Brittany, 47 ft.; Mexico, 36 ft.; and in Siberia, 30 ft.

It is estimated that the best kinds of steel contain about one-fifth per cent. of nitrogen.

Under the stimulus imparted by photography, a school of English opticians is growing up and already rivalling their foreign competitors.

It is a singular astronomical fact that, whilst there was no full moon this year in the month of February, both January and March each have two—January, on the 1st and 30th, and March, on the 1st and 31st. This accident has never occurred before, nor will it occur again for two and a half millions of years.

It has been found that 1 lb. of hydrogen combining with oxygen is capable of raising 51,146 lb. of water 1 deg. Fahr.; 1 lb. of carbon, 14,500 lb. of water; 1 lb. of phosphorus, 11,900 lb. of water; and 1 lb. of sulphur, 2,800 lb. of water.

The order of the variation of the temperature of man within the tropics is not the same as in England, being lowest in the early morning, after the night's rest; and not as in England, at night, before going to rest.

A Building Society at Florence has already been of signal benefit to the working classes. The buildings completed contain 930 rooms, which are let in sets of from one to five, at the following annual rents, which are paid half-yearly:—One room, 40f.; two, 75f.; three, 110f.; four, 220f.; and five, 300f.

If all the seeds of a plant of hyosciamus, which of all known plants produces the greatest number of seeds, came to maturity, it would only require four years to cover the earth with plants; and if all the ova of a herring became fish, eight years would suffice for its posterity to fill the whole ocean.

In England and Wales 27 letters were delivered to every person upon an average in the year 1864; in London, 51; in Scotland, 20; in Ireland, 9; in the United Kingdom, as a whole, 23—the total number exceeding 679,000,000.

It has been computed that 800,000,000 gallons of fresh water, in a tolerable state of purity, derived from the various sources and tributary streams of the Thames, descend through Teddington Lock every twenty-four hours.

The Victoria Bridge at Montreal is only 176 ft. less than two miles; the Menai Bridge is 1,880 ft. long; the former is therefore nearly five and a half times longer. Waterloo Bridge, over the Thames, is 1,362 ft. long.

There is no stone arch in existence of a greater span than 250 ft. The Chester Bridge, built by Harrison, has a span of 200 ft. That which formerly stood at Trezzo, over the Adda, had an arch of 251 ft. span, the versed sine of the segment slightly exceeding one-third of the chord.

In the course of a series of experiments on the action of exploding gunpowder, conducted by General Pelletier, four pounds of powder were spread on a light wooden platform, which was placed on soft earth; the powder being inflamed caused only a slight depression of the table, but when the experiment was varied by placing a sheet of paper over the powder, the table was shattered to atoms.

Things Talked About.

Very gracefully the Queen has come forward to acknowledge the splendid donation by Mr. Peabody to her subjects—a "noble act of more than princely munificence," well worthy of royal thanks. May her words form another link in the chain which, in spite of all that noisy agitators may say, binds together the two great countries. The Royal letter is as follows:—"Windsor Castle, March 28, 1866.—The Queen hears that Mr. Peabody intends shortly to return to America, and she would be sorry that he should leave England without being assured by herself how deeply she appreciates the noble act of more than princely munificence by which he has sought to relieve the wants of the poorer class of her subjects residing in London. It is an act, as the Queen believes, wholly without parallel, and which will carry its best reward in the consciousness of having contributed so largely to the assistance of those who can little help themselves. The Queen would not, however, have been satisfied without giving Mr. Peabody some public mark of her sense of his munificence, and she would gladly have conferred upon him either a baronetcy or the Grand Cross of the Order of the Bath, but that she understands Mr. Peabody to feel himself debarred from accepting such distinctions. It only remains, therefore, for the Queen to give Mr. Peabody this assurance of her personal feelings, which she would further wish to mark by asking him to accept a miniature portrait of herself, which she will desire to have painted for him, and which, when finished, can either be sent to him to America, or given to him on the return which, she rejoices to hear, he meditates to the country that owes him so much."

Thomas Carlyle has signalised his inauguration as Rector of Edinburgh University, by the delivery of a speech which is worthy of his fame. Delivered extemporaneously, it is less involved in style—less marked by "Carlyleisms" than his written works; but it is, in spirit, essentially akin to the best of them. This is how he urges the students to diligence in their studies, and to be content with such rewards as their work itself will bring:—"The wiser kind of man—the select, of whom I hope you will be part—has more and more a set time to it to look forward, and will require to move with double wisdom, and will find, in short, that the crooked things that he has to pull straight in his own life for round about, wherever he may be, are manifold, and will task all his strength wherever he may go. But why should I complain of that either, for that is the thing a man is born to in all epochs? He is born to expend every particle of strength that God Almighty has given him in doing the work he finds he is fit for—to stand it out to the last breath of life, and do his best. We are called upon to do that; and the reward we all get—which we are perfectly sure of if we have merited it—is that we have got the work done, or at least that we have tried to do the work; for that is a great blessing in itself, and I should say there is not very much more reward than that going in this world. If the man gets meat and clothes, what matters it whether he have ten thousand pounds, or ten million pounds, or seventy pounds a year? He can get meat and clothes for that; and he will find very little real difference intrinsically, if he is a wise man. I warmly second the advice of the wisest of men—'Don't be ambitious; don't be at all too desirous of success; be loyal and modest.' Cut down the proud towering thoughts that you get into you, or see that they be pure as well as high. There is a nobler ambition than the gaining of all California would be, or the getting of all the suffrages that are on the planet just now." Noble words, which the working man, disposed sometimes to cavil at his lot in life, may well take to heart. It is the old, old Gospel—"what thy right hand findeth to do, do with thy might;" the old maxim of the primitive monastic life, *Laborare est orare*—"labour is prayer"—uttered anew.

The Government Dockyard men are protesting, with good reason, against the proposed disfranchisement of their order by the sixteenth clause of the new Bill. It certainly appears most incongruous that the same measure which offers votes to so many now excluded, should also take away the privilege now enjoyed by some of the most industrious and respectable men in the country. The plea, we suppose, is that they are liable to be influenced by the expressed or implied wishes of their superiors; in other words, that they find it almost impossible to exercise the franchise independently. Why punish them for that? Punish the men who use the influence of their position to intimidate those who are, to a certain extent, at their mercy.

We are sorry to record a continuous emigration from the coal and iron districts of South Wales to America. The men and their families are quitting their native shores by hundreds. We have reason to think that they are deluded by promises which will only end in disappointment.

It is stated that the proposed extension of the Factory Acts to the iron and hardware trades will not be proceeded with this session. A majority of the Wolverhampton Chamber of Commerce have passed a resolution to the effect that it is not desirable to interfere with the labour of young persons over the age of thirteen, or of women. Most probably the Government measure, which is only postponed, not dropped, will take a much wider range than that.

Sheffield file-makers, look out. A Bill has been reported in the Senate of Massachusetts to increase the capital stock and power of the "Whipple File Manufacturing Company" by the addition of 1,000,000 dollars (or £200,000) to its capital. It is understood that in the works of this company improved machinery is used in the manufacture of files, the workmen in the United States being always ready to welcome all labour-saving machinery.

The Ironmasters' Association will in future hold its meetings at Birmingham. The number of members is rapidly increasing.

The West Yorkshire miners have held a meeting on Hunslet Moor, near Leeds. A general amalgamation of all the miners of the United Kingdom is looked forward to. The West Yorkshire societies can now pay 12s. a week to a man on strike, and 1s. 6d. for each of his children: and they claim to have already raised wages, by the efforts of the union, 10s. a week. "Five shillings a day, a day's work of seven hours, and a week's work of five days," are the objects now aimed at. What do London bakers think of that?

The directors of the London, Brighton, and South Coast Railway have replied to the memorial presented by the signal and switchmen, asking for an increase of pay. The directors say, "The demand of the men to be paid 30s. a week at junctions, and 26s. at roadside stations, is unreasonable, taking no account whatever of the differences which exist between the work at different parts of the line, which differences are represented as fairly as need be in the present scale of payments. The company's men may safely be told they are better paid and treated than any signalmen in England, unless the South Eastern Company may, perhaps, rival it in that respect; and none of them work eighteen hours at a stretch. Such a thing is forbidden, and if it is done at all, it is for the convenience of the men themselves, and entirely against orders, so that they may take six hours at the next turn of duty in place of twelve."

The Preston spinners have a new grievance, and a very valid one. Some of the mills in which they work are so ill-built, that accidents are of frequent occurrence. One recently, of a very serious character, has alarmed the men, and a memorial to the Home Secretary has been adopted, setting forth the opinions expressed in the resolution, and stating that there are in Preston nearly 100 similar buildings, in which many thousand operatives are employed, who have, in consequence of this accident, become seriously alarmed for their safety.

A blacksmith has been committed to prison for one month, for a "knobstick" outrage, at Manchester. A number of men had struck work, and one, who refused to join in the strike, was maltreated by the prisoner. The month's imprisonment is a severe lesson, but, in truth, a wholesome one.

Captain W. Macbay has published a pamphlet, proposing a truly colossal scheme, which, however, is not likely to be realised: nothing less than the union of England and Ireland by two railroad bridges, one between St. David's Head, in Wales, to the coast of Wexford, forty miles long; and the other, twenty miles long, between Portpatrick, in Scotland, and Donaghadee, in the north of Ireland; the bridges to be built on embankments! Our breath is almost taken away by the colossal character of the scheme; and, after all, what could the bridges do more than could be done by the quick-sailing steamboats of every-day life? The captain

makes no estimate of the cost, but proposes that the work shall be done by convict labour.

America is fast regaining its old supremacy in the English cotton markets. In the two months ending Feb. 28th this year the United States sent us 570,735 cwt. of raw cotton—nearly one-half of the total import, 1,154,122 cwt. In the corresponding two months of 1865 the United States sent 5,719 cwt. out of a total import of 811,601 cwt.

Co-operative Intelligence.

Barnsley.—The British Co-operative Society Report.—The progress made by this society during the past four years which it has existed may be gathered from the fact, that the profit for that period amounts to not less than £1,759 4s. 4d. There are now 622 members, holding £1,933 shares; the increase to the shares during the past quarter amounts to £322 7s. 10d.; the profit for the past quarter amounts to £241 10s. 8d.; the receipts during the quarter show an increase of £578 8s. 8d; the amount disposable for the quarter, with the surplus from last account, is £270 18s. 4d., from which the committee recommended a dividend of 1s. in the pound upon purchases during the quarter. The committee, finding it impossible to transact the business in the present store, made an appeal to the members for powers to erect an additional store, with two eligible frontages, on a plot of land adjoining the present building. The appeal was heartily responded to, and the work has already been let by tender. A new branch store is also in the course of erection at Ardsley, a village near the town.

Tring, Hertfordshire.—The Tring Co-operative Industrial and Provident Society was commenced on the 12th of February, 1866, by sixteen working men. Since that date the number of members has been increased to thirty. The members have exerted themselves so as to subscribe upwards of £8 in seven weeks, although their wages as agricultural labourers rarely exceed 11s. per week at this period of the year.

Saffron Walden.—A Co-operative Society has recently been commenced here; it already numbers forty-one members, who have taken up forty-eight £1 shares. Business operations in the flour and meal trade were to commence during the middle of the past month.

Northamptonshire Industrial and Provident Boot and Shoe Manufacturing Society.—According to the last half-yearly report, the amount of goods manufactured and sold during the half-year, to Co-operative Societies and others, was £2,970; contributions on shares, £177; investments, £50; and the net profit, £264 8s.

Co-operation in Jamaica.—It has been proposed to introduce the Co-operative principle into the cultivation of several of the sugar-producing estates in Jamaica.

Co-operation in Clerkenwell.—A few working men in Clerkenwell and neighbourhood, influenced by the various accounts of the rapid growth and success which Co-operation is making in and around London, and in all parts of the country, held a meeting, on the 15th of March last, at 8, Queen Street, Clerkenwell, when it was unanimously resolved to form a Co-operative Society, to be called the Clerkenwell Co-operative Supply Association (Limited). A committee was subsequently appointed to draw up rules suitable for such societies.

Great Harwood.—The twenty-eighth quarterly report of the Great Harwood Industrial and Co-operative Provision Society (Limited), for the quarter ending March 17th, 1866, shows that there has been seventeen new members added during the quarter, and six withdrawn, showing an increase of eleven during the quarter. A dividend of 1s. 4d. in the pound to members, and 5d. in the pound to non-members, was declared payable on Wednesday and Thursday, the 4th and 5th of April.

General Information.

CLUBS AND INSTITUTES.

The usual "Popular Lecture" meeting was held in the Surrey Chapel, Blackfriars Road, on Easter Monday, the Rev. Newman Hall in the chair. Several hundred people were present. The subject of discussion was Working Men's Clubs, which were warmly approved of by the chairman, and also by Mr. G. M. Murphy, who expressed regret that a great pressure of business had hitherto prevented them from entering into the movement as heartily as they would have wished. The meeting was also addressed by the Rev. H. Solly, and by Mr. Symons and Mr. Dale, members of the Southwark Working Men's Club, who gave a very cordial invitation to the working men present to join it.

Chess Competition.—The competitors for the prize offered by the Council of the Working Men's Club and Institute Union met in the large room, 150, Strand, on March 20th, and also on March 28th. The number of clubs represented was five—viz., Camden Town, Clerkenwell, Essex Road, Shoreditch, and Stoke Newington. The number of competitors taking part in the game was eleven. At their first meeting one game was won and one drawn. On the second occasion, seven games were won and one drawn, one game also having been played in the interim. The next general meeting will take place on Thursday, April 12, in the Office, 150, Strand. Tea will be on the table at seven o'clock, and the chess-playing will commence immediately after.

London Secretaries' Monthly Tea-Meeting.—The usual meeting was held at the office of the Working Men's Club and Institute Union, 150, Strand, on Wednesday, 28th ult., when about twenty members of the London clubs sat down to tea. Members were present from the following clubs:—Paddington, Marylebone (All Souls), Camden Town, Southwark, Vauxhall Bridge Road (Victoria), Chelsea, Wandsworth, Fleet Street (St. Bride's), Islington (Essex Road), Clerkenwell, Shoreditch, Stoke Newington. Those who had come to continue the chess tournament retired, after tea, to a separate room, and the ordinary discussion was carried on by the other representatives of clubs. The Rev. H. Solly presided, and a very interesting discussion, continued from the previous meeting, on the admission of youths to Working Men's Clubs and Institutes, was carried on with much spirit to a late hour. As the main points are dwelt on in a separate article, they need not be related here. The next monthly tea-meeting will be held on Thursday, 26th April, when the presence of members, either of London or country clubs, will be cordially welcomed. The attention of secretaries and committees of clubs is requested to the notice respecting cards of admission given in the Working Man for March 24th, p. 188.

Monmouth.—The attempt to establish a Working Man's Club in this town has proved successful. The institution is supported by voluntary subscriptions. A code of rules has been drawn up for the regulation and guidance, not only of the committee, but those whose benefit is sought. A Provident Club is also to be established in connection with the institution, to which all ticket-holders shall be at liberty to subscribe a sum of money weekly, the deposits to be returnable on the 31st of December in every year, with interest thereon; but should a ticket-holder withdraw his deposits at any time before the 31st December, no interest will be allowed. Suitable premises have been taken, and the necessary preparations are being made for opening the institution at once. The committee will provide, in addition to newspapers and other periodicals, chess, draughts, and dominoes, and have arranged for supplying refreshments at the lowest possible charge. The working man will be allowed to smoke his pipe, and to make himself free and easy.

Rotherham and Masbro' Working Men's Club.—A literary and musical entertainment was recently given in the hall of the above club, and was attended with great success.

INDUSTRIAL EXHIBITIONS.

Hadley.—A very interesting exhibition was opened here on Thursday, the 5th instant, in the Hall Barn. An adjacent part of the building was set apart for objects of interest or curiosity, lent for the occasion by residents in the neighbourhood. The industrial department included articles of the widest range. There was saddlery, tricked out in a way that almost led one to suppose that a horse was encased in it; wheelbarrows refulgent with paint; rustic tables, flower vases, sticks, models of machinery, photographs, needlework of every form, babies' dresses, gentlemen's slippers, screens, curtains, patchwork, embroidery, crochet work, wool work, and far more things, both useful and ornamental, than the casual visitor would have expected. One table was devoted to the works of school children, which did them great credit. A model of Pedmore Church, by E. Wells, deserves remark. In the lower department was an extensive and most valuable collection of medals and insects, by Mr. John Gray.

WAGES AND STRIKES.

Padiham.—The cotton twisters and drawers of this place recently held an adjourned meeting, for the purpose of considering the refusal of the masters to advance their present rate of wages, according to a request sent in about a fortnight ago, when a resolution was unanimously carried that fourteen days' notice to leave be given to their employers, and at the expiration of that time to strike work if their demands are not complied with.

Todmorden.—The cordwainers belonging to the Amalgamated Society have, on application to the masters, received an advance of wages.

The Cotton Trade at Ashton and District.—Several mills in Ashton, Stalybridge, Mossley, Hyde, Dukinfield, and surrounding places, are about to recommence working full time. Some of them have been only partially worked, whilst others have been totally closed, since the commencement of the American war. There is a difficulty about the hands; owing to the scarcity of cotton operatives already in these districts, a demand for several thousand additional hands will be a call not easily complied with. Wages are rising rapidly, and partial turn-outs are taking place every day for higher wages.

Cheltenham.—The carpenters, joiners, bricklayers, and plasterers in the employ of several builders in this town have recently turned out. The carpenters on strike number about 150. The rate of wages paid to the carpenters and joiners varied from 3s. 6d. to 3s. 8d. per day, and they now demand a uniform wage at the rate of 4s., to work from six to six every day but Saturday, when they would leave off at two o'clock. The strike is not expected to be a protracted one.

Shipley.—The journeymen shoemakers at Shipley are making an effort to obtain an advance in their wages. It is said that this class of artisans, at the present prices, cannot earn more than 16s. a week, and for this sum they have to work very long hours.

Leeds.—At a recent meeting of the Carpet Manufacturers' Association, held at Leeds, it was decided to advance the rate of wages paid to workmen, as follows: Four-fourths super, 10 per cent.; Dutch, 20 per cent.; and the remainder kinds 10 per cent., excepting square and beam rugs. The advance will take effect from June 1st, subject to Scotch masters paying after the same rate from December 1st, failing which the old prices will be resumed. At a meeting of carpet weavers held at Heckmondwike, it was unanimously resolved, "That while this meeting views with the greatest pleasure the success of our efforts for an advance of wages, we also recognise the conditions on which that advance is granted, and determine by our individual efforts to do all we can by moral and legitimate efforts to advise the masters of Scotland to give an advance of wages equal to that just promised by the English manufacturers." Also, "That this meeting being satisfied that the masters have acted wisely by resolving to open their premises for work from 6 a.m. till 6 p.m., we do hereby pledge ourselves to support them in their efforts to carry out the same."

Staveley.—On the 30th ult. a meeting of miners was held at Staveley, to encourage the formation of a miners' union throughout Derbyshire, and to receive an appeal for assistance from the filemakers in Sheffield thrown out of employment by the lock-out or strike. There were about 200 miners present. Mr. Edwards, agent to the Miners' Union, took the chair; and the meeting was addressed by Mr. Edwards and by a deputation from Sheffield. The chairman denounced the hours of work for miners as too long, and complained of the weighing and butty systems. He also condemned the practice of allowing boys of tender age to work in the pits, and urged the miners present to combine into a union, holding out as an inducement that they would be able to secure for themselves 7s. per day, with only seven hours' work. Mr. John Fitzgeorge, secretary to the hardeners' branch of the Sheffield file trade, next addressed the meeting. Mr. C. Bagshaw, chairman of the Associated Trades' Union, followed in a fluent and effective speech, after which the meeting came to a close.

Burslem.—The labourers and bricklayers of this town have asked for an increase of wages, and it is generally understood that they will strike until the masters agree to pay the advances asked for. The labourers demand 18s. per week; but the masters decline to give it, and offer them 17s. per week, with a diminution of two hours in time. The bricklayers ask for the weekly wages of 29s.; this the masters also decline to give, and propose 28s. 6d. per week, with the same diminution in time as above. Notices have been issued by the master builders, from which it appears that they are determined to abide by their offers in each case.

Huddersfield.—Notice has been given by the plasterers of their intention to cease work if their employers do not grant them a rise of 2s. a week wages, and a reduction of two hours a week in labour. They now work fifty-four hours, and want to work fifty-two, and to have 26s. instead of 24s. a week. The masters have offered to concede the reduction in the time, but not the advance of wages.

Birmingham.—A meeting of outworking journeymen tailors was recently held in this town. The chairman, in the course of his address, stated that, with respect to the present application for an advance in prices, the masters generally were willing to concede a rise, and the only difference now was, as regarded matters of detail, and particularly as to how far the advance should extend. Several of those present spoke during the evening, and the general opinion was, the dispute should be settled amicably, and a strike avoided if possible. At a meeting of the master tailors, it was proposed and carried unanimously, "That the advance desired by their journeymen of 3s. per week should be acceded to.——A few evenings since there was a general meeting in the Town Hall of the master builders, operative bricklayers, carpenters and joiners, and labourers, "for the purpose of appointing delegates to act as arbitrators under the provisions of the existing trade rules," when a resolution to the following effect was unanimously carried: "That we, the master builders, operative bricklayers, carpenters and joiners, and labourers of Birmingham, do mutually agree to abide by and conform to all trade regulations which shall be made and agreed to by the delegates we are about to appoint, or which shall be settled by the casting vote of the chairman they may appoint."

Blackburn.—An address to their employers has been issued by the twisters and drawers of this town, setting forth their claims to an advance of wages. On the 26th ult. a public meeting of the drawers and twisters was held, for the purpose of hearing the result of the address. It was stated that no satisfactory answer had been re-

ceived. A deputation was appointed to wait upon the committee of the Blackburn Manufacturers' Association, whenever it may be convenient for the interview to take place.

Sheffield.—The bricklayers' labourers here have published a letter, in which they state:—"The demand of the masons and bricklayers to cease work on Saturdays at one o'clock, and for 2s. per week in advance of their usual rate of wages, has been freely complied with by the master builders of Sheffield; and now we, the labourers, consider that our demand of 1s. per week in advance is in no way extravagant. When the masons and bricklayers have got a rise of 2s. per week, we are at least entitled to 1s., as the heavy part of the work has to be performed by the labourers."——Nothing decisive has yet been done to bring the dispute in the file trade to an end. The question of arbitration as a means of settlement has been discussed by both sides, but there appears to be great difficulty in agreeing to the terms upon which the arbitration shall take place. It is considered highly probable that the Associated Trades will recommend the men to submit to the introduction of machinery on the understanding that they be allowed to work it; and if that be done, and the masters agree to the condition, there is a probability of the remaining question in dispute being amicably arbitrated, and the strike settled.

The Weavers' Dispute at Barnsley.—A dispute between Messrs. Harvey and Co., linen manufacturers, and their workpeople still continues, with no signs of an abatement. They asked for an advance of 10 per cent., which being refused, the weavers, as their work is completed, cease to work for the firm.

Folkestone.—The carpenters and joiners in the employ of one of the leading firms here having struck for an advance of 6d. per day, a general lock-out has taken place.

The Northern Ship-yards.—The strike among the men connected with the iron shipbuilding yards on the Tees, for the reduction of their ordinary day's work to nine hours, seems to be no nearer a settlement, as the masters decline to make any more concessions. The same observations apply to the ship-joiners, who are also in strike on the Tyne.

Middlesborough.—The joiners and painters are on strike here, and the workmen employed at the rail mill of the Consett Iron-works still remain out.

Monmouth.—The carpenters and joiners of this place have asked for an advance of 6d. per day.

Hartlepool.—The journeymen sail-makers of this neighbourhood have given to their employers a notice to the effect that they desire to work from six in the morning to five in the afternoon five days in the week, and to four on Saturdays. The difference between the present time and that asked for is two hours and a half.

Whitburn.—The shoemakers have recently obtained a considerable advance upon their wages without having made a formal demand for it. No strike or unseemly agitation was at all required, the masters having voluntarily proffered the rise in question. The rise obtained is from 4d. to 6d. on men's boots and shoes, and from 2d. to 3d. on women's.

Worcester.—Messrs. Henderson and Co., carpet manufacturers, have agreed to make an advance of ten per cent. from the 1st of June next, which will add rather more than 2s. per week to the present wages of the hand-loom weavers employed by them.

Airdrie.—At a recent meeting of operative bakers, a deputation was appointed to wait upon the employers, for the purpose of soliciting an advance of wages, and a limitation of the hours of labour. We understand the masters have not conceded the demand, and the men have determined to strike unless it be complied with.

Accrington.—Most of the manufacturers here have added five per cent. to the wages of their hands, and some have exceeded that amount; but the average throughout the district will be at least five per cent.

Durham.—The journeymen joiners of this city lately held a meeting to consider the propriety of asking for increased wages and shorter hours of labour, when it was decided that an advance from 26s. to 28s. per week should be asked for, and that work should cease at five o'clock on week days, and four on Saturdays. A deputation was appointed to lay the resolutions before the masters, who, however, refused to grant the demands of the men. The men accordingly struck work. A meeting of masters was subsequently held, when they agreed to pay the men by the hour instead of by the day. This offer was rejected by the men; but at another meeting of masters held, it was agreed to give the 2s. advance demanded, it being at the same time decided the question respecting the nine hours' movement should remain in abeyance until some general determination had been arrived at in the neighbouring towns. The men readily accepted this offer, and speedily recommenced work.

Carlisle.—The joiners, carpenters, and cabinet-makers, are out on strike for an advance of wages to the extent of 3s. a week. The marble masons employed by Messrs. Nelson and Sons, in the same city, have likewise struck work upon a demand for the shortening of hours being refused. The stonemasons are also making a movement for a reduction in the hours of labour to the extent of two hours and a half a week, coupled with an increase of wages by 2s. a week. The bricklayers' labourers have also demanded increased wages. The boot and shoe makers have also solicited an addition of sixteen per cent. to their present wages.

EMIGRATION.

Canada.—The correspondent of the *Times*, writing from Canada, says:—"The truth is (as I hope to show more fully in a subsequent letter), the present position of the province with regard to the United States is vastly different from that which it occupied before the war. Then Canada paid taxes and duties, and the Americans paid none. Labour found a good market in the States, and prices were low. Now this is all completely reversed. It is Canada which holds out every inducement to emigrants. The taxation amounts to no more than 1 dol. 85c. a head throughout the province—say 7s. 6d. It is difficult to find out exactly what the precise amount is in the United States, but certainly it is not less than 11 dols. a head, or about £2 5s. 8d. At the present moment, as I have before mentioned, gold is only at 127, and prices in New York are nearly thrice as high as when gold was at 260; the difference to men of fixed incomes may be imagined. The cheapness of living and clothing and every article of common life here is absurd after an experience of the prices in the States. Better beef can be bought in the market here for 10c. a pound than in New York for 30c. A turkey can be got for a dollar, which, in New York, would cost five or six. Without attempting in this letter to go more fully into the difference, it may safely be said that prices here are from half to two-thirds lower than in any part of the United States. A man lives comfortably in a Canadian city on 1,000 dols. a year, where, in New York, or any of the cities, even so far out as Chicago, it would cost him 3,000 dols. In New York, a suit of clothes, of outlandish and barbaric fashion, costs 100 dols. in greenbacks (say, at the current rate of exchange, £17 10s.). A better article may be had anywhere in Canada for £5 or £6. It is the same with everything. Now, under these circumstances there is no temptation for the Canadians to go over to the United States; all the inducements are the other way. They are not craving to have a share of the United States' debt put on their shoulders, nor are they anxious to pay American prices for household necessities. The fact is, that emigration from the United States is actually setting in to Canada, and in a few years this country will probably occupy a position which will relieve England from any anxiety with regard to it, and render it one of our most powerful dependencies. The Canadians are now deriving substantial advantages from being under the British flag, and they know it, and hence, perhaps—self-interest being a powerful motive—some of the enthusiasm of their loyalty."

South Australia.—According to the latest accounts, the large supply of labour which is now arriving has not yet caused inconvenience, though the immigration agent of Port Adelaide reports that "in the ships which have arrived during the last quarter there has been too large a proportion of miners, and there is at present great difficulty in finding them employment." He also states that, "although there is a demand for agricultural and other classes of unskilled labourers, there is considerable difficulty in finding employment for those who are married, having families of young children, the support of whom directly or indirectly falls on the employers—a burden more especially felt when the price of food, as at present, is unusually high. This objection will not hold good in the same degree with mechanics and other classes of skilled labour."

The Labour Market in New South Wales (Jan. 19, 1865).—In Sydney the market is well supplied with almost every description of labour, both skilled and of an ordinary character. There is also a considerable number of educated persons seeking employment as clerks, bookkeepers, tutors, governesses, &c. The rate of wages is as follows:—With board and lodgings or hut-room and rations—blacksmiths and carpenters, £50 to £70 per annum; married domestics and farm servants, £45 to £50 ditto; grooms, coachmen, and gardeners, £35 to £45 ditto; farm and garden labourers, £30 to £35 ditto; surveyors' men and ploughmen, £30 to £35 ditto; bushmen and rough carpenters, £35 to £40 ditto; porters and butlers, £30 to £40 ditto; shepherds and stockmen, £25 to £35 ditto; families, shepherding from two to four flocks, £45 to £70 ditto; housemaids and nurses, £15 to £20 ditto; general servants, £18 to £26; cooks and laundresses, £26 to £30 ditto.

ART PRIZES.

Society of Arts' Prizes for 1866-7.—The council have decided to enlarge the basis on which artisans may compete for prizes for art workmanship, and have passed the following resolutions:—Any producer will be at liberty to exhibit, either in his own name, or through his workmen, any work or works as specimens of good workmanship in the classes given below, provided that the work or works be accompanied with a statement of the name or names of the artisans who have executed their respective portions; and if the work or works be sufficiently meritorious to deserve them, extra prizes will be given to the artisans who have executed them.

Artisans may, if they think fit, exhibit works executed by them after other designs, in any of the below-mentioned classes. Such works may or may not contain the whole or portions of the prescribed designs, but must be of a similar style and character. Competitors must specify the class in which they exhibit. Extra prizes will be awarded.

The work submitted must be delivered at the society's house on or before the 22nd December, and will be exhibited at the society's house, and afterwards at the South Kensington Museum. A selection of the best works will be made and sent to the Paris Exhibition of 1867.

The classes will be as follows:—

FIRST DIVISION.

Works to be Executed from Prescribed Designs.

Class 1. Carving in Marble, Stone, or Wood.
Class 2. Repoussé Work in any Metal.
Class 3. Hammered Work, in Iron, Brass, or Copper.
Class 4. Carving in Ivory.
Class 5. Chasing in Bronze.
Class 6. Etching and Engraving on Metal—Niello Work.
Class 7. Enamel Painting—on Copper or Gold.
Class 8. Painting on Porcelain.
Class 9. Decorative Painting.
Class 10. Inlays in Wood (Marquetry or Buhl), Ivory, or Metal.
Class 11. Cameo Cutting.
Class 12. Engraving on Glass.
Class 13. Wall Mosaics.
Class 14. Gem Engraving.
Class 15. Die Sinking.
Class 16. Glass Blowing.
Class 17. Bookbinding and Leather Work.
Class 18. Embroidery.
Class 19. Illuminating.

SECOND DIVISION.

Works to be Executed Without Prescribed Designs.

Class 20. Modelling.
Class 21. Wood Carving.

Except in classes 1, 2, and 4, the subjects will remain as in the list already issued; but in classes 1, 2, and 4, other subjects will be given, particulars of which will be duly announced.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE WORKING CLASSES AND THE REFORM BILL.

To the Editor of the Working Man.

Sir,—I derive weekly great pleasure from the perusal of the excellent and varied contents of the Working Man. I think its introduction was well-timed, as it supplies an acknowledged and long-felt want. I read Mr. Clay's able speech on his introducing "A Bill to extend the Elective Franchise in England and Wales," and the opinion I formed of the Bill, from what I could learn from his speech, was, that as a means of extending the present limited franchise, it was worthy of the support of those who were willing to compete for the honour of being placed on the electoral roll as educated voters. I read the article on "Opinions Wanted in Parliament," and I intended to have written a short answer to that appeal, but, my spare time being fully employed in the temperance reform and other social and progressive movements, I had not an opportunity. I, nevertheless, did not forget the matter, but scanned your issues with much interest to learn the opinions of my fellow-workmen. The answers in No. 12 seemed to me to be somewhat wide of the mark, and the writers appeared to have the idea that Mr. Clay intended to substitute his method for those already in existence. I was much surprised at the communication of Mr. Glazier, as I am aware he is a man who possesses more than the average intelligence, and has been a successful competitor upon a question closely connected with the one before us. He seemed to me to have got by rote the stock arguments of those who oppose an extension of the suffrage, and to have reiterated them, as though they were in every respect just and true. I have heard in discussion-rooms and similar places such arguments as your correspondents use. I am well aware of the difficulties the workman has to contend with in acquiring a small amount of knowledge. Millions of my fellow-workmen have had to toil long hours almost from infancy, without books or schoolmaster, and no one to inform them of the pleasures and beauties of learning, or the advantages which knowledge confers. The greater portion of those who went to the village schools thirty years ago were, like myself, never taught a single sentence of grammar, or saw a work on constitutional or general history. It thus appears to me the writer takes a low estimate of working men, without considering the causes which produce their seeming want of intelligence, and advocates non-enfranchisement until the workman possesses his standard of excellence. I, sir, in opposition to the writer, contend for manhood suffrage as manhood's right, and its exercise as manhood's duty. Exclusiveness is the Englishman's bane. It has produced class-legislation, and brought innumerable evils upon the community; it is the main support of ignorance and the other evils its apologists charge the people with; it has prevented education—more especially political education—and has been the cause of men not assuming the rights of citizenship and performing the duties connected with it. And it is a natural sequence that the people should be deficient of that knowledge which, the writer states, not even the middle classes possess.

The writer further states that "the exercise of the

elective franchise is a solemn and responsible duty, and can only be rightly exercised by those who have a knowledge of the responsibilities." Very good advice; but who are to be the teachers? Not Locke, I suppose, because, if we are to believe the Tories, he was refuted long ago. Not Lord Russell—his "Constitutional History" has received at their hands the like defeat. It must not be Bentham or Spencer, or writers of that school, as the perusal of their writings by the working classes would be outrageous, as they are, of course, reserved for the educated classes. It is not the writings of that eminent man, J. S. Mill, because, if half what was said of his works by the Tory prints during his candidature for Westminster be true, he is little less than Satan himself. It cannot be the Tories—or, as they are pleased to call themselves, the Constitutionalists—because Mr. Disraeli informs us in his "Life of Lord George Bentinck" that the "Tories are always ten years behind," and the workman's educated friends would not wish him to be so far back as that. It cannot be the late Archbishop Whately, as he states, "The 'House of Commons' [or 'Lower House'] consists of the 'representatives' of the people; that is, persons elected by them to take care of their interests" ("Lessons on the British Constitution," p. 42). Now, that principle is totally at variance with the present state of the House of Commons. The people are not represented there, as may be seen by the present condition of their dwellings in the metropolis. The people feel that at present Government does not exist for them—that they have but little share in its results—that their petitions are unheard, or, as the common expression is, they are thrown under the table. It is a well-known fact that the working man who studies the history and constitution of his country, and who interests himself in political matters, and is able to expose the anomalies of the present system, is no favourite of the upper classes. He is looked upon with suspicion, and is caricatured by *Punch*, and is charged with setting class against class; and the idea of the workman's children being taught political knowledge under the present educational system is to me one of the drollest imaginable. At present, in almost every educational and social institute, politics are forbidden topics; and I have more than once been sorry to see the almost pious horror which some of those who pretend to take great interest in my class profess to feel at the bare idea of politics being introduced.

I cannot understand how, in the face of such testimony as the late election brought forth, men can be found who will still ignore the just claims of their class to a voice in the choosing of representatives, who impose taxes they are called upon to pay and pass laws which they are bound to obey. It seems to me that legislation of that description is grossly tyrannical, and an injustice which outrages that religion they profess to be guided by.

Professor Fawcett bore testimony to the honesty and consistency of the working men of Brighton. Mr. Hughes and others could have added the same testimony for their constituencies; and would, I believe, from their knowledge of our class, bear witness that all we require is justice. Sir J. P. Kay Shuttleworth, in an address at the Kendal Working Men's Club, said that the working men were more advanced in economic science than the upper classes, and that, under an extended suffrage, they would form a sound system of sanitation and education. In conclusion I may state that, as manhood suffrage is not likely to be granted for a long period, Mr. Clay's proposal might be incorporated with the Government Reform Bill. But I believe no system of government will ever be satisfactory but that which rests its power upon the whole people. Every man would then feel that he had a duty to perform, and would fit himself for it. Liberty would no longer be an unmeaning name. Every man would be, under such a system, attached to his country—would obey her laws and honour the institutions, and protect them to the utmost of his power. Englishmen could not then feel as I felt on passing the polling booth at the late election whilst some of my countrymen were performing the duties of citizenship. I, although born in England of English parents, was an alien. To me the election was a mere farce; and I felt that, in spite of the English boast of liberty, millions of my fellow-men were, like myself, not free, and were, to all intents and purposes, political serfs—degraded as men. And, musing thus, I determined there was a work to do; and I know, in spite of anything said to the contrary, that there is a stern determination on the part of the unenfranchised to work earnestly until political serfdom is totally abolished, and every Englishman is a free man.—I am, Sir, &c., H. Randall, Joiner.

To the Editor of the Working Man.

Sir,—Would you allow me, through the medium of your valuable periodical, to make a few remarks upon the Reform Bill which is now before the country? The object of the Bill is to enfranchise 400,000 of the working classes, and to give to them a fair share in the representation of the country; and, sir, when we consider that all matters which are intended for the popular benefit are carried by majority, I do not think, when we ask that the great majority of the nation should have some voice in the administration of its affairs, that we ask for anything which we are not legally, morally, and equitably entitled to receive. But, looking at this matter in another light, I think you will agree with me in saying that we have a right to the franchise. At municipal elections, which, directly, are of much more vital importance to us, very little is said with regard to the ineligibility of the working class, which, in that instance also, is generally by far the more numerous class. If they can exercise wisdom and discretion sufficiently to enable them to record their votes in favour of a town councillor, they can also, with equal discretion, act their part in the return of a member who shall advocate and represent their interests within the walls of St. Stephen's. So far as the Bill itself is concerned, I do not think myself that it is such a liberal instalment as the voice of the populace has demanded; but, placing their interests in the hands of that great statesman, Mr. Gladstone, they are willing and ready to accept it as an earnest of his attachment to the working classes, and of his advocacy of the rights of the people. The working men of England must, ere this, have become fully convinced that in Mr. Gladstone they have a man who holds very high opinions of their class, and who considers them to be, not what Lord R. Montagu would have us believe they are; but, on the contrary, is of opinion, "if working men were admitted to that House, they would set an example of good breeding which the noble lord would do well to imitate," for "the people who would be admitted to the franchise were our fellow-subjects, fellow-Christians, and our own flesh and blood, whom they had hauled to the skies for their good conduct—men whom they had seen bear destitution, almost starvation, with a patience which was a lesson to all." This statement, coming as it does from the greatest statesman and most accomplished orator of his time, cannot pass by without convincing every working man in this country that they have in Mr. Gladstone a true advocate of their interests. But this is not the first act which he has played on the stage of time for the purpose of doing good to the English workman. The partial repeal of the tea and sugar duties was a great boon; and the repeal of the paper duty must also be deemed as a step which has effected a vast amount of good in the country. By repealing the very obnoxious tax upon knowledge he has been the means of diffusing through the press cheap and sound literature to the working classes, with the object, no doubt, of making them more intellectually entitled to the franchise; and now, after three or four years have passed away, he brings forward a measure which he, as well as his colleagues, consider a sufficiently liberal instalment for the present time. It is to be hoped, therefore, that the working men of England, by the exercise of the interest with which they are associated with the subject of Reform, will give decisive proof of their determination to demand a share in the representation of the country, and the result will be that skulkers will be found on the right side of the House, and the question decided by the admission of 400,000 of their class to the right which belongs to every man.

Trusting that you will find a spare corner for the enclosed, I remain, your obedient servant,

Chester, April 2, 1866. Maurice Jones.

To the Editor of the Working Man.

Sir,—It has been said many times by some of the greatest statesmen of the present time—men of different political opinions—that the working men of this country have now attained to a state of intelligence which fits them for the franchise; but the method by which they judge of the intelligence of the working class is false. To suppose a man intelligent because he happens to live in a house of the value of £7 a year, is erroneous. To judge of a man's intelligence, he must be questioned, and the answers which he may give will decide the question. The present Government see it in no other aspect than that of pounds, shillings, and pence, which, I think, is a very clumsy way of judging the fitness of working men for the franchise. They tell us that the franchise is a most solemn trust, and not a right, and that they ought to be very mindful in conferring it, lest the privilege should be abused and the State ruined; but, by their mode of giving it, they cannot tell whether the person to whom they give it be intelligent or ignorant, sober or intemperate, good or bad.

There are now two Bills in the House of Commons to amend the representation of the people—the Bill of the Government and the Bill of Mr. Clay. The difference between them is very great, and deserves the most calm and serious consideration of every working man. The Government Bill is complicated in its details, and difficult to understand. Not one working man in ten can comprehend it, and even editors of newspapers differ as to its meaning. Mr. Clay's Bill is simple and easy to understand. It contains the germ from which would spring a great deal of good, if it should be passed into law. It would place the franchise within the reach of all sober, industrious, intelligent working men; and those who do not now possess the necessary amount of knowledge, under the provision of the Bill, to qualify them for the franchise, would be stimulated to greater exertions, in order to attain the requisite knowledge.

I believe it would be a very hard task for a working man turned thirty years of age to learn to read, write, and to work the first four rules of arithmetic. Considering the time he has to spare, and the circumstances in which he is placed, it would require great mental application on his part, though the subjects are in themselves simple and easy. To possess the franchise, on such conditions as are specified in Mr. Clay's Bill, would be worth all the labour and trouble to obtain it. If working men could be admitted within the pale of the constitution by qualifying themselves mentally, a good effect would be produced in their minds, and a step would be taken in the path of real progress. The institutions of our country would be strengthened, and the throne more secure. The fears of the aristocracy that everything would be turned upside down would cease; the question of the franchise would be settled; all clamour and political agitation about it would be at an end, and peace and harmony prevail throughout the land.—Yours respectfully,

A Hard-working Blacksmith.

To the Editor of the Working Man.

Sir,—I feel thankful to see so many thoughtful, intelligent, and well-meaning working men responding to the call made upon them, to give expression to their views upon various important subjects, and especially upon the very great subject of Educational Franchise. Many thanks to Mr. Clay for bringing forward his Bill; though I think sound objection can be urged against some portions of it. I am exceedingly pleased with the letters inserted in No. 12 upon the subject. They have led me to a conclusion in my own mind that if a few pamphlets were drawn up upon the necessity that exists for National Government—the election of a Government, and its prime duties; the class of men who ought to be elected by those who are privileged and have a right to be called upon to elect the men; the very great responsibility resting upon them in the discharge of the important duty devolving upon them; the sacredness of the franchise or vote, which makes them belong to that important portion of the people of every kingdom or state upon earth commonly called citizens—such pamphlets would do an immense political good, and would strengthen the hands of those who would like to see more intelligence and independent action brought to bear upon the election of men who are to discharge the important duties of legislators. I feel sure they would have a very large sale, and that every one of your subscribers to the Working Man would push their sale with all possible energy, well knowing that they must produce great national good.—I remain, Sir, yours, &c., W. Clarke.

4, Dennet Street, Sneaton, near Nottingham.

THE AMERICAN EMIGRANT ASSOCIATION.

To the Editor of the Working Man.

Sir,—As I perceive that you devote part of the space of your ably-conducted paper to the important subject of emigration, I trust you will allow me to call your attention to the existence of an association, the want of which has long been felt by thousands of emigrants. Its main objects are to disseminate information among the workmen of Europe respecting the labour market of America; the wages obtained there; the class of workman required—here the farm labourer or miner, there the skilled worker in metals, wool, or cotton; information respecting climate, soil, and cost of land. In these and other matters this company proposes to become an efficient guide and valuable friend to the emigrant workman. This association, which is styled "The American Emigrant Company," has its head-quarters in New York; but the British agency is under the control of Mr. Williams, of Drury Lane, Liverpool. I learn from a periodical issued by the company that among its managers and patrons are several New York bankers, and Rev. Henry Ward Beecher and other clergymen; and among its references in this country are George Peabody and Thos. T. Potter, M.P.

One of the great advantages that the company offer is that the emigrant may learn in what part of the New World there is a demand for his kind of labour, and where the market is already well supplied, and this without any charge. The company also offers to farmers and others disposed to the life of an agriculturist eighty or 160 acres of freehold land, part of it ready ploughed, with a house, tools, seeds, and a flock of sheep, on terms of easy payment extending over a number of years.

I believe it is the custom for employers of labour who are in want of British artisans to make direct application to this association; and, by this means, in many cases, the emigrant can be engaged for a term before he leaves home, and in some cases his passage money is advanced. R.

TO CORRESPONDENTS.

O. E. G.—If a property be really good, it would be a credit to compass its success by a Co-operative Company if it had failed in private hands. But if this failure damaged its prospects commercially, that would be an objection to it.

J. M. desires to know if there is a machine that would *dade*, quickly and correctly, hair in quantities for fishlines; and, also, a machine to twist and plait the same.

Pengwern.—We find ourselves unable to comply with your request, which is certainly not a very reasonable one.

R. J. Deepel.—The lines forwarded by you are full of spirit, but having been previously published in a separate form, we are unable to avail ourselves of your offer.

A Carpenter.—Yes; under the circumstances mentioned you could obtain a patent, but is the invention really worth the trouble and expense?

C. B. wishes to ascertain if there are any knitting-looms or machines adapted for domestic use, and where they may be obtained.

T. James.—Prussiate of potash answers very well for case-hardening small steel articles; but, for large articles, preference is given to bone-dust, pieces of hoofs, and leather.

Lux.—We do not see that your questions have any practical bearing. Steel, of course, is the recognised metal for cutting purposes, and is not likely to be superseded, whatever properties of hardness any alloy may possess.

S. M.—The money would be quite safe in a Post Office Savings Bank. We do not recommend it to be placed in any private bank.

Ripley, J.—Steel is inlaid with gold and silver wire by cutting the grooves in the steel before it is hardened, then beating in the wires. Metal ornamenters cut a peculiar slanting groove in the steel to receive the precious metal, which cannot afterwards be drawn out.

Atkins.—Plumber's solder is composed of one part tin and two parts lead.

Burnet, J.—The varnish on enamelled leather is composed mainly of drying linseed oil, usually mixed with lamp-black, to give it body, or with Paris white and coloured pigments. After this mixture is laid on, it is dried slowly in an oven. Several coats and successive polishings with pumice-stone are necessary to render it smooth.

T. E. D.—The haddock and herring will keep good any reasonable time, if sufficiently salted. Finnon haddock to be consumed within four or five days are salted for four or five hours, and smoked with peat smoke for the same length of time. Yarmouth bloaters are salted for a week or so, and smoked to a fine golden yellow colour in three weeks.

THE LONDON CENTRAL

Painters' Hall Company,

LIMITED.

Incorporated under "The Companies Act, 1862," whereby the Liability of each Shareholder is limited to the amount of his Shares; and no Shareholder will be allowed to take more than Ten Shares.

CAPITAL, £2,000, IN 2,000 SHARES OF £1 EACH,

WITH POWER OF INCREASE.

Deposit on Application, 2s. 6d. per Share, and 2s. 6d. on Allotment. No Call will exceed 2s. 6d. per Share, or be made at less intervals than One Month.

Directors (pro tem.).

FREDERICK EMANS SHEARMAN.	WILLIAM MARKS.

Bankers.

BIRKBECK DEPOSIT BANK, 29, Southampton Buildings, Chancery Lane.

Solicitor.

Secretary (pro tem.).

WILLIAM HENRY TOFTS.

Temporary Office.

39, UPPER JOHN STREET, FITZROY SQUARE.

OFFICE HOURS: 7 to 9 P.M.; Saturdays, 3 to 5 P.M.

This Company is established for the purpose of Leasing or Building a Painters' Trades Hall, Library, and Reading Room, for the use of Trade, Benefit, and other Societies.

PROSPECTUS.

Seeing the great evil of having our meetings at public-houses, and the necessity of improving our condition, both morally and socially—conscious of the difficulties and failures that have attended all former efforts in this direction—we have taken a broader basis as the foundation of our work, and a fixed determination that no effort shall be wanting on our part to ensure its success.

To remove the existing evils of public-house meetings, the London Central Painters' Society members have formed a Company, on the principle of limited liability, for the purpose of leasing or building a hall in a central part of London, such building to consist of a hall capable of holding 1,000 persons seated, library, and reading-room, with large rooms for the use of various societies to hold their meetings in, with committee and refreshment rooms attached, lavatories, &c.

The calls are made easy, to enable working men to take up shares. All are invited to co-operate in the scheme; and, to prevent monopoly, no shareholder will be allowed more than ten shares.

The promoters of the Company are, on allotment, to receive the money outlaid for the promotion of the Company, and no further remuneration until 10 per cent. has been divided amongst the shareholders; any profit over and above this rate to be divided amongst the shareholders and promoters, in proportion of two-thirds to the shareholders and one-third to the promoters.

For the many benefits it will confer upon them, it behoves the working classes generally to devote their entire energy to its advancement, and take every opportunity of making it known and appreciated; as we advance in years, numbers, and intelligence, great and numerous will be the advantages which those who come after us may acquire through our earlier exertions.

The promoters, in bringing this scheme before the working classes, feel the greatest confidence that, if supported by those it is intended to benefit, it will prove one of the greatest advancements of the age, both morally, socially, and financially, and will ultimately produce a large dividend to the shareholders.

FORM OF APPLICATION FOR SHARES.

To be retained by the Bankers of the Company.

No.

To the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED.

GENTLEMEN,—I have paid to your credit at your Bankers the sum of £ , being a deposit of 2s. 6d. per share on shares in the above Company in respect of such shares, or in respect of any less number you may allot me, and I agree to pay the further sum of 2s. 6d. on allotment thereof, and the instalments according to the terms of the Prospectus.

Name in full,

Residence,

Profession or Trade,

Dated this day of 186

If it is not convenient to make the deposit with the Bankers of the Company, the form may be sent by post to the Office of the Company, accompanied by a Crossed Cheque or Post Office Order for amount of the deposit, which will be paid into the Company's Bankers, and the Receipt returned by post to the Applicant.

BANKERS' RECEIPT.

To be signed by the Bankers and returned to the Applicant.

Received this day of 186 , of for the Directors of the LONDON CENTRAL PAINTERS' HALL COMPANY, LIMITED, the Sum of on account of an application for an allotment of Shares in the undertaking.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to
FRANCIS RAVENSCROFT, *Manager*. [28

The Planet Permanent Build- ING AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.
Offices—39, City Road, London, E.C. [29

INTERIOR OF A LONDON BAKEHOUSE.

London Bakers and Bakehouses.

MUCH has recently been said respecting the condition of the London bakers, the unhealthy character of their employment, and their deprival of many of the opportunities of recreation and intellectual improvement possessed by most working people. When a Government inquiry was instituted, some few years back, for the purpose of obtaining reliable information as to the actual condition of the men and boys employed in the baking trade, the evidence showed that numerous abuses existed, several of which were capable of being easily remedied, without the need of legislative interference. The principal evils complained of by the men were the excessively long hours of work, and the unhealthy character of the places in which the work was performed.

The period of labour was found to vary from twelve to eighteen hours, and, in some cases, even longer, the men scarcely having time to procure more than two or three hours' sleep at a time. Indeed, the greater portion of their lives might be said to have been passed in the bakehouse, which is often made to serve the purpose of workshop, living-room, and bedroom, all combined. There are many journeymen bakers who have scarcely ever known what it is to sleep in a bed. They have had to take their rest on the hard floor of the bakehouse, undeterred by the myriads of black-beetles and cockroaches crawling about in all directions. Many of this class of journeymen are natives of Germany, who have been attracted to this country in the hope of obtaining a higher rate of wages than was procurable in their own.

Various attempts have been made by the operative bakers to procure a reduction of their hours of labour, and the improvement of the places in which they are employed; yet, notwithstanding their powerful organisations, they have not been able, up to the present time, to accomplish their desired object. The interference of the Legislature has been sought and refused, on the ground that, were the Government to interfere, its aid for a similar purpose would be invoked in other trades, and there would be no knowing where to stop. The introduction of bread-making machinery, at one time, bade fair to open a chance of speedy improvement, but the hope has not been realised.

The sanitary condition of many of the London bakehouses is deplorably defective. Not a few are simply mere cellars, lighted with gas, and utterly devoid of anything like proper ventilation. The oven is placed at the back, and, but for the admittance of a little fresh air through the cellar grating, the atmosphere would be utterly unbearable. In summer it frequently is so. Existence in such dens can only be accomplished at the sacrifice of health and strength. Accordingly, we find the journeymen bakers, as a class, becoming decrepit and worn out before their proper time. Consumption and diseases of the lungs prevail to a frightful extent among them, and the spectacle of an aged journeyman baker is somewhat rare. Many of this class, when they find their health beginning to fail, exchange their occupation for some other, more healthy, although less remunerative; some, having saved the requisite funds, emigrate to the United States and other countries; while a few endeavour to set up in business for themselves. Scarcely any think of remaining in the trade all their lives. They know that it generally means disease, suffering, and premature death.

Yet why should this be? There is no need for the trade to be so disastrous in its effects upon the health and comfort of the workers. With properly constructed places of work, and reduced hours of labour, the occupation of the baker might be rendered as healthy as any in the whole range of productive industry, and this, too, without much, if any, appreciable sacrifice of profits on the part of the employer. To their honour be it said, there a few master bakers who have endeavoured to improve the condition of those in their employ. They have erected large, commodious, and well-ventilated bakehouses, in which the men are separated as much as possible from the neighbourhood of the oven, and where every mechanical appliance has been introduced for the purpose of lightening the amount of labour required. In these admirable establishments the night-work has been reduced to a minimum; and there is no reason why it should not be the same elsewhere. It is said that the demand for hot rolls in the morning is a valid reason why the journeyman baker is compelled to work such long hours as those of which he so bitterly complains; but the excuse seems very weak, especially when it has been emphatically asserted by various practical men that the morning supply of hot rolls can be produced without necessitating the employment of so large an amount of night-work.

But, after all, the real remedy lies with the public. They might, as in the case of the Early Closing Movement, powerfully assist the cause of the men by refusing to deal at those establishments where excessive hours of labour were insisted upon. There would, at first, be some show of opposition, and, perhaps, no little amount of grumbling; but the employers would be compelled to yield, and the men would gain a victory without having recourse to the dangerous expedient of a strike.

The Great Portrait Exhibition.

A new pleasure has been prepared for the residents of London and the visitors thereunto. We are glad to announce that the preliminaries are at last completed. We allude to the Exhibition of National Portraits, which has been provided at the instance of Lord Derby, who suggested that there should be made a collection of the most valuable historic portraits possessed by the country, in its ancient ancestral halls and public institutions. The result of the noble lord's advice is shown in this, the noblest collection of the kind that has ever been seen together in England, and as for that, in the world: comprising nearly 1,200 portraits, illustrating the very commencement of the art of portrait-painting in England, beginning with the Plantagenet reigns, and coming down to the year 1688. The place of the exhibition chosen is in the Exhibition Road, exactly opposite the Art-training Schools. The galleries devoted to the reception of these portraits are those occupied formerly as the Refreshment Rooms of the International Exhibition of 1862. These galleries, which are lighted from the Royal Horticultural Society's Gardens—that is, the windows look into that spacious area—are very extensive; yet, three tiers of floors are required to hold the whole of these pictures. Even then the wall space has had to be increased many times by dividing each gallery into eight or ten compartments, by the erection of high screens. By this arrangement the visitor does not see the large gallery at once filled with pictures; but a series of quiet, spacious compartments, each occupied by thirty or sixty pictures, according to their size.

The portraits are so tastefully arranged, and hung with so much judgment by Mr. Samuel Redgrave, and the gentlemen who act with him, that each of them can be seen in a pleasurable way, and studied with proper attention. When the Exhibition is crowded, as it will be when its interest is known, the throngs will never impede each other, as they do at the Royal Academy and other large rooms, but will be equalised and distributed in the different divisions.

There is also an interesting exhibition of another kind—namely, of Naval Architecture—opened in the same rooms, consisting of sea-pieces, paintings of the bodies or hulls of celebrated war ships, showing the different outlines and constructions adopted in the progress of ship-building; and splendid models of vessels of famous reputation. Among others, is a magnificent model, very large, and, probably, the finest ever built, of the *Northumberland*, the great iron-plated ship, which won't be launched, and, at the time of writing this, remains provokingly imbedded, half way between land and water.

Through this exhibition the visitor in search of portraits passes; but he finds no difficulty in discovering the continuation of the series of the pictures, for each one bears a neat and peculiar yellow label, distinctly visible at a great distance, bearing in it the name of the person or persons painted, the name of the painter, and the name of the lender—the Earl of Derby, Her Majesty, or whoever it may be—and also the number of the picture as it stands in the catalogue. The visitor, therefore, without a catalogue, or without any reference to it if he has one, can understand the chief facts of the portrait before him. This is a great advantage, and one never before afforded with the same degree of completeness in any previous exhibition. The catalogue itself is a model of perspicuous typographical arrangement and interesting description.

The galleries have not long been open for public inspection. The private view took place on the 14th inst., and the public opening two days afterwards, on the 16th; but by the courtesy of the Directors, the Press were afforded the opportunity of inspection during the week preceding the opening. The portraits are arranged chronologically. The first is Rosamond Clifford, lent by her Majesty. Excepting the names of Luca Cornelli, Petrus Christus, and Van Eyck, few names of painters occur between 1154 and 1502, when Hans Holbein, the great father of portraiture in this country, comes upon the field. When some of the Oxford University authorities first felt ambitious of having portraits of the founders of colleges, they employed a painter who, as he had no original to sit to him, and no sketches to guide him, did the best he could. He imagined their features, and, as nobody was living who ever knew them, nobody could dispute the fidelity of the portraits. An eminent art-critic has pointed out that many noblemen, when the taste for portraits set in, were in the habit of collecting them from foreign countries, or wherever they could obtain them. When these noblemen died their collections descended to their posterity, when the portraits came to be considered those of the ancestors of the family; and in this way numerous old portraits, interesting as works of art, but of entirely unknown authenticity, exist in ancient mansions.

To discover the actual painter of a picture is an affair of considerable ingenuity, research, and practical knowledge. Some painters, like Holbein, employed a peculiar background; others had a characteristic method of painting—mixing their colours in a peculiar way. In some countries a particular kind of wood was used for panels; in others, a peculiar sort of canvas. Even these materials differ in different periods. Some painters marked their works with initials or symbols. In the days of Horace Walpole, few of these points were understood or were investigated. During the last century all sorts of learned, curious, and experimental connoisseurs in art, and thoughtful, observing picture-restorers have amassed thousands of facts of the greatest interest. Mr. Scharf, Mr. Cunningham, Mr. Wornum, Sir Charles Eastlake, practical restorers and art writers, like the author of "Robert Dalby," have revised these accumulated observations; and now the authenticity and genuineness of old pictures can be determined with an accuracy unknown before. It is owing to these labours and criticism that the chronological arrangement of this gallery is possible. In cases in which the painter is doubtful, the visitor is informed; where a name is given it may be relied upon; so that the humblest visitor has the same satisfaction as the highest personage in the land in contemplating these portraits of persons famous in history either for their services or attainments. Of the interest attaching to this great collection we may speak on another occasion. Of all the works of art, portraits have the most personal interest. To see the lineaments of the men and women who people history, and who have made the world what it is, is one of the greatest of pleasures; and the public are indebted to Lord Derby, who suggested the exhibition, who is a liberal contributor to it, and whose influence has been exercised to induce the possessors of great works of art and interest to denude their mansions of their costliest attractions for the gratification of the public. In no other way could these treasures of portraiture ever be seen.

A visit to the National Portrait Exhibition will be classed among the recreations of working men during the present year.

*A Bit of Work-a-day Biography.**

How I got through the rest of the night, goodness only knows; but by the time it became daylight I found my way into Smithfield, for I felt as if I'd like to be near where my mother was lying. It was market morning, and I stood about, watching the cattle, and the dealers, and the drovers, till the hospital was opened. Then I went in among the patients who were waiting to see the doctors. One of 'em near the door was a big, well-built man, with a dirty, but cheery-looking face; he had his hand in a sling, and was talking to an old woman with a baby in her arms. Presently he beckoned me, and asked me some questions; and he spoke in such a fatherly manner that I soon told him all I knew about myself and my mother.

Now I come to think, you must ha' known Joe Stoker; he used to work for your people before he set up in a little way for himself in Cow Cross. Well, it was him, and he had met with an accident—hit his hand, maybe, instead o' the iron. The end of it was that he took me home, and for a year or so I worked the bellus all day, and went to a ragged school at night. After that he begun to teach me the trade, little by little, so that by the time I was fourteen I could do odd jobs and work at the anvil pretty well. But I never did take much to books, and they used to tell me I should never be a credit to the school, which, being a ragged school, wasn't saying much for a chap; still, I went reg'larly, and tried my best. Joe Stoker, as I dare say you know, wasn't a bad scholar, and he used sometimes to go of an evening and help the boys over their figures, and his only child, Mary—who was about my own age, and as pretty and good a lass as ever was—went with him to show the gals how to make their own clothes. You should ha' seen how hard that gal of his tried to knock the lessons into my stupid head. I managed 'rithmetic fairish, for Joe was always makin' me count the strokes o' the hammer, the rivets, or the number of hours it wanted to Sunday, and I could chalk letters a bit on the wall; but as for spellin', I believe, as sure as you're smoking that there pipe, I'd never ha' known how to spell decent if it hadn't been for Mary. The nights that Joe didn't go out, I used to polish myself up a bit extra and see her across to the school; and all the way there and all the way back, it was spell, spell, spell, till I got hold of the words of the lesson.

Now I always looked upon Joe more as a father than a master, and so, when his wife died, and he took on so as to neglect his business, and when he was a'most ruined through a heavy job as he

* Concluded from page 228.

never got paid for, and when he broke his leg and was laid up for ever so long—all which happened afore I was twenty—I stuck all the closer to the shop, and he used to say, though not in my hearing, that Providence had giv' him a son as he never expected. I don't believe my own father could ha' treated me better than he did—or so well, for that matter—and I did all I could to show as I was not ungrateful.

It's just seven years ago this past Christmas, that one morning the postman brings Joe a letter as big as a sweetheart's valentine, and when we sat down to dinner he took it down from the mantelshelf and read it over and over, and seemed cast down like, and more thoughtful than usual. Yes, you're right, he was allers a bit serious, but he knew when to be serious and when to be cheery, and it aint every one as does. Well, as I was sayin', the letter didn't seem to do him any good; and so, thinking he might want to talk it over with Mary—whatever it was—I made an excuse about a job being wanted, and got back into the shop as soon as possible. He wasn't very long after me, but I could see when he came in that something had gone wrong. I had a good mind to ask him about it two or three times, but didn't, and so we scarcely spoke a word all the rest of the day.

Well, that evening, when the forge was shut up, Mary and I went out for our usual walk. Mondays, Wednesdays, and Fridays, we helped a bit at the school, and the other nights we took a stroll up along the New River, which wasn't covered up then as it is now. I never shall forget that night. We walked for miles without ever saying a word, and I don't know how much farther we might ha' gone in the same unsociable manner, if Mary hadn't said, "Harry, shall we go back?" There was nothing partic'lar in that, says you; no more there wasn't; but then, I could tell by her voice that she was cryin'; and then I up and asked her what was the matter at home, as I knew it must be that as made her low-spirited. "Well," says she, "you'd better know it first as last; they're going to turn father out of the forge, after he's had it for so many years, and it's to be pulled down to make a railway." You see, Joe never had a lease, so he couldn't make them find him another place, and it was too late to start afresh at his time o' life, as he said, and he didn't like to work journeywork agin, if he was able, which he wasn't. All the way we walked home we talked it over and over; and when we got nearly back we turned round and went over the same ground agin, for I wanted Mary to settle it right off hand. At last it was getting so late, that we began to fear lest Joe should be angry, so I pulled Mary's arm a bit tighter through my own, and I took her little wee hand in mine, and by the time we got to the door, though we hadn't spoken for ever so long, I pretty well understood what I might do next morning.

For all Joe's misfortune, I felt happier that night than I had ever done before, and in the morning I was up full an hour earlier than usual, workin' away with all my might, and singing like anything. Ay, and I was thinking, too—thinking how I should break it to Mary's father. Joe didn't come down till eight o'clock, and then he walked right up to the anvil where I was working, and looked me straight in the face. I felt as though I could ha' dropt, or asked his pardon for something. I s'pose he saw I looked foolish, for he stopped me as I was going to speak, held out his hand for mine, and, giving it a grip, "Harry," says he, "you've been a good lad as a servant, be an honest man as a son." He's dead now, bless him, but there's many a lad that was in the school besides me as'll keep him in memory.

So you won't wonder now why I don't like to hear the ragged school spoke against, though I shouldn't care to tell one as 'ud go and tell it agin, which I know you won't. I sometimes say to myself that if it hadn't been for Joe's going to that school, and feelin' for the poor boys there, he wouldn't have taken a fancy to me, and I mightn't have learnt what little I know, and I shouldn't have had a trade in my hands, and I'm quite certain I couldn't ha' got a wife as 'ud make me so happy, or as 'ud have her place so neat and tidy as makes me proud to ask a mate home and smoke a pipe over a bit o' gossip.

I s'pose I've pretty well tired you out with my talking, but you must stop now and take a bit o' supper. Mary always goes once a year and has tea with the teachers in Clerkenwell, and if this hadn't been the night, we shouldn't have been able to have such a spell alone together.

Ah! that's her; she's a'most as reg'lar as clockwork. Excuse me a minute. She's got the youngster with her, and I must carry him upstairs, for he's an awful weight, I can tell you.

A Working Man's Defence of Working Men.

The working classes of this country have seldom found among their own ranks advocates more eloquent, temperate, and able, than James Crowther, who, at a recent Reform meeting at Todmorden, said:—

"If I were to consult my own feelings, I should have been sitting to-night as a listener, instead of standing here to support the resolution which has just been read. But when it was represented to me that the co-operation of non-electors and electors was needful to make this truly a town's meeting—and when I remembered that the chief promoters of this meeting were persons already in possession of the elective franchise, and saw them give their time and care to secure for us the boon which they enjoy—I felt that it would be a thankless return for their self-denying labour if we left them to plead our cause alone, and that the working class would richly deserve the charge of apathy or indifference, which is sometimes brought against them, if we refused our co-operation when asked, except for some good reason. And then, so long as votes are denied us, it is only in meetings such as these that we can make our voices heard in matters political; and, to my thinking, this is the time when the class of workers should speak in language that gives a certain sound. It is proposed to enfranchise a number of working men; and though they may fairly claim it as a right, we are looked on as suppliants for favour, and treated very much like the way in which a purse-proud rich man treats his poor and dependent neighbour. I have often noticed if a man is poor, he is expected to be perfect; and when some flaw or infirmity is found in his character, it is regarded as a sufficient reason for allowing him to starve, because he has not been as good as he should be. And this is about the spirit which the enemies of reform are at this time manifesting. When it is proposed to give us votes, all at once it is discovered that we are a drunken, thriftless class of persons—ignorant as asses, and about as self-willed; that we have little morality, and less religion; and the country is warned in solemn tones of the danger of conceding to us one jot or tittle of political power. I grant that their description is partially true of but too many individuals among us; and if all the vices of the working class could be incarnated in some single person, he would almost realise the hideousness of the monster they love to paint; but I think we may fairly complain about having the worst vices of the worst men among us made typical of the class.

"It is bad enough for working men to be criticised and lectured at (as they have been of late by certain newspapers and certain politicians), without being misrepresented as well; for, no doubt, many of you know the kind of advice that is given us, and the sort of inferences which are drawn from our conduct. They tell us that if we wish to get a vote, we must show ourselves worthy of it, by acting the part of good citizens and obeying the laws. Well, sir, this advice we have acted on, and for these many years past the working men of England have shown themselves as loyal, as peaceful, and as orderly, as if they had had blue blood in their veins. It is true there have been exceptions—but not many more than are to be found in the higher classes of society—and these are to be accounted for by the disadvantages of their education and circumstances. Nor has this been shown merely in the regular course of ordinary times, when prosperity has made them tolerant of many wrongs, but in the recent cotton famine—which, considering its duration and its severity, we may fairly call unequalled—they have manifested those qualities of heroic, manly fortitude which have extorted the admiration of Europe, and have written a page in England's history which will shine bright when the deeds of Percy and Howard are all forgotten. But, lo and behold! after we have done the very things they advised us to do, these very men turn round, and tell the country that we do not care to have a vote, because we are not enthusiastic enough. If we wish to be received within the pale of the constitution in any other capacity than that of taxpayers, we must have no rows, no riots, no threatenings, such as forced the last Reform Bill into law; and then, because we take the hint, they point to our peaceable attitude as a proof that we are content with our present exclusion."

After criticising the nature of the objections urged against the Government Bill, he stated his reasons for believing it to be an honest measure. By that act the Ministry had established a claim to the support of reformers of every grade.

Mr. Crowther then alluded to the question of electoral corruption, the existence of which he deplored; after which he said: "Whether the working class possess the franchise or not, they are the thews and sinews of the State—the upholders of its influence, and the guardians of its honour; by their industry they have made England the hive of commerce, and by their endurance have extorted the admiration and envy of the world in the performance of the duties of citizenship; and by their loyalty and obedience to the laws of the land, they have given the best proofs possible of their fitness for a share in the government. And it behoves every lover of his country to ponder seriously the danger of continually resisting demands thus temperately urged, lest, through constant refusal, a sense of injustice should breed resentment and wrath, and force you to yield to fear what you refuse to justice. For, whether the present possessors of power will own it or not, we (the unenfranchised) are as truly Englishmen as they are, and have a stake in the country as dear to us as theirs. Their fortunes may lie in broad acres and splendid mansions, ours consist in the wealth of love that centres round the home we call our own, and is a treasure as preciously prized as theirs. The revolution that robs them of wealth will bring misery to our own hearth, and so is dreaded by us as much as they; and having given the nation these pledges of fidelity, why must we be continually suspected? and why refuse a generous confidence to men that breathe the same free English air, and speak the same English tongue, by not allowing us to add one more to the many links that bind us in allegiance to the throne we love, and to this country we call our own?"

Without declaring any opinion upon the particular political measures advocated by Mr. Crowther, we cannot forbear to express our admiration of the felicitous style of speaking in which he gave utterance to the sentiments of a large portion of his fellow working men. A speech delivered in such pure English, and in so manly and nervous a style by an artisan, is a very strong evidence of the latent power which exists in many individual working men, and which only requires earnest and judicious perseverance to be practically developed.

Paper Collar-making.

Paper collars are fast superseding those of linen. A machine, patented by Mr. D. M. Smyth, of New York, is one of the most singular and remarkable inventions of the day. Three peculiarities distinguish this machine above all others in use:—

1. *Simplicity.* What by all other processes requires to have a dozen separate operations is here accomplished by one. A single stroke of the die produces a perfect collar, button-holed, stamped, and moulded. The collar is turned by a single machine, and by another is, with nine of its companions, folded for the box. The latter process is in every other manufactory performed by hand. The small number of hands through which the collar passes also prevents it from becoming soiled.

2. *Its remarkable capacity.* This machine produces two collars per second; the eleven machines which are now in operation produce twenty-two collars per second, 1,320 per minute, 79,200 per hour, and 1,900,800 every twenty-four hours. Three hundred machines would supply every man, woman, and child in Great Britain with one collar per day.

3. *Its economy of labour and material.* The eleven machines in operation save the work of 396 hands. More than nineteen per cent. of the paper is saved, which in every other process is wasted. Seventeen distinct varieties of collars are manufactured by these machines.

THE WORKSHOPS OF THE WORLD.

INTERIOR OF MESSRS. BROWN AND POLSON'S PATENT CORN FLOUR MANUFACTORY, PAISLEY.

The Patent Corn Flour Manufacture.

We not unfrequently meet with persons who, with much self-complacency, affect a lofty disregard of what they eat, and who boast that in order to keep their appetites in subjection, they systematically, and on principle, eat whatever is set before them, quite irrespective of its character or fitness for the circumstances under which they live; endeavouring thus to carry out the recommendation of Solomon, to eat only for strength, not for pleasure. The gratification of the sense of taste, however, serves a much higher purpose than is commonly supposed; for, as a general rule, if the appetite be not blunted or perverted by excessive indulgence, our tastes and our requirements are very closely related; so that in man's natural state taste becomes, as it were, a sort of instinct, and takes rank as one of God's providences for the preservation of our health. In this way we may explain, what is matter of common observation, that a man's taste varies with his age, habits, and circumstances of life. At one time he wishes for, at another scarcely bears the sight of fat; sometimes he craves for animal, at other times for vegetable food. Indeed, the feelings of hunger and thirst, which have reference to quantity rather than quality, are not more evidently instinctive than is taste, which regards only the quality of food. As a guide, it may be safely trusted, both as to food and drink, if only we listen to its simple teaching, and do not abuse its confidence.

In no other way than the above can we explain the very remarkable varieties in the food consumed in different climates. Witness the Laplander with his mess of blubber, or the inhabitant of the tropics, with his refreshingly-cool and juicy fruit. In both these instances taste assumes the part of instinct, and guides the possessor to the selection of a diet which his circumstances render necessary. Hence taste becomes the handmaid of science, and points to a law in the dietary of individuals, telling them what they ought to eat, drink, and avoid. It suggests variation under varying conditions, and notably so in regard to temperature; for, from the two great divisions or types into which all foods are classified—namely, the nitrogenous, or tissue-forming, and the calorifacient, or heat-creating—it selects instinctively that one which science demonstrates to be most necessary.

A few words on these two types of food will serve to illustrate the dietetic value of the corn flour, one of the manufacturing processes of which forms the subject of our illustration.

By the term *nitrogenous* is meant all foods, whether derived from the animal or vegetable kingdom, which contain nitrogen as one of the elements of their composition, in addition to carbon, hydrogen, and oxygen. These foods are also called nutritious—that is, tissue-formers; and the measure of their nutritive value is the quantity of nitrogen they contain. The reason of this is found in the fact that all the tissues of the body, fat excepted, contain nitrogen; and those wherein the nutritive changes are most active, such as muscle and nerve, contain the largest amount of nitrogen. Examples of these foods are—meat of all kinds, eggs, milk, beans, peas, lentils, bran, and the inner coat of wheat, flour, or bread; though in the latter we approach nearer to the purely starchy or calorifacient group, and so get farther from the nitrogenous class.

The calorifacient or heat-producing group are foods which contain little or no nitrogen, but only carbon, hydrogen, and oxygen; starch and its varieties, rice, sago, arrowroot, potatoes, and flour; fatty and oily substances, such as butter, cream, and milk; and all the varieties of sugar. These make up the class of heat-sustaining foods, and though they do not directly nourish tissue, except where they also contain traces of nitrogen, they nevertheless perform scarcely less important functions in the human body, for, besides assisting in the process of respiration, they develop fat for the protection of the muscles, and, above all, they principally maintain the heat of the body which is essential for the due performance of all its functions. This they do by the union of their carbon with the oxygen of the air in the process of respiration, in the same way as in the combustion of coal—the residual oxygen and hydrogen being in the proportion to form water.

The required desideratum, it is believed, is now supplied in the case of flour made from maize, which, when boiled with milk, presents such a combination of animal and vegetable food as closely resembles ordinary beef and bread, while, at the same time, it is in so light and easily digestive a form as will keep the system fully nourished, when the stronger and more stimulating food would only weaken and depress by its indigestibility.

The maize plant, from which the corn flour is obtained, is said to attain, in favourable localities, a height of seven to eight feet, and bears two different kinds of flowers. When ripe, the grain produced by the plant forms a favourite article of food in tropical countries. In America it is dried before a fire and ground into meal, known as "hominy," which, mixed with wheaten flour, makes good and wholesome bread.

To Messrs. Brown and Polson belong the credit of being the first to introduce into this country the systematic manufacture of flour from the grain of the maize plant; but, although the article produced by them is so well known, few are acquainted with the details of the processes by which the corn is converted into flour. The grain, on its arrival into the Paisley establishment, is steeped in water, as shown in the illustration above, for the purpose of being cleaned from the various outward impurities which it may have gathered on being reaped, or during its transit from the shores of the Black Sea, where it is easily reared.

While yet in a moist condition, it is placed in large hoppers, and conducted to the grindstones, which are worked by steam power, and which rapidly reduce the grain to a mass of thick pulp, a kind of semi-liquid mass. After this process has been completed, the pulp is placed on a kind of inclined plane, arranged along the upper part of the building, and during its gradual descent, the liquid portion of the pulp, containing gluten, &c., is carried off through long pipes into cisterns below, while the remaining matter, consisting of pure farina, settles in a receptacle at the bottom of the inclined plane.

The pulp, by this time a somewhat hardened mass, is then subjected to a washing process, being placed for that purpose in large vats filled with pure water, after which it is carefully dried at a low temperature, and finally made up into neat and portable packages for the market.

The remaining portion of the maize, after the extraction of the amylaceous matter, is dried and ground, and sold as gluten.

*The Harmonium.**

The mechanical parts of the harmonium are very simple, consisting essentially of a clavier, or key-board, similar to that of the pianoforte and organ, and bellows to supply air to act upon the reeds. Ordinarily, the key-board has a compass of five octaves, the lowest note being "8 feet C," corresponding with the fourth open string of the violoncello. The keys, when pressed by the fingers, open valves, by which the wind from the bellows is allowed to act on the reeds. The bellows are of the ordinary double construction, with a reservoir, and two feeders worked by the feet of the performer. In the ordinary state of the instrument, the wind is supplied to the reeds from the reservoir of the bellows, at constant pressure, as in an organ, and the tone is then of uniform strength.

Like the organ, the harmonium is furnished with stops, usually four in number, divided into halves, and acted upon by eight draw-stops, placed immediately over the clavier, so as to be within convenient reach of the hands. They receive different names from different makers, but the following are those usually adopted:—

BASS.	TREBLE.		ORGAN-PIPE.
1. Cor Anglais . .	Flute (Percussion)	=	8 feet.
2. Bourdon . . .	Clarinette	=	16 feet.
3. Clarion . . .	Fifre	=	4 feet.
4. Bassoon . . .	Hautbois . . .	=	8 feet.

The two 8-feet stops are of different qualities, one of them being acted upon by the *percussion* movement—an invention intended to remedy the defect of want of promptness in the reed answering to the touch on the key. It consists of a small hammer, connected with the key, which gives a gentle blow to the reed at the moment of opening the valve; the effect of which is to make the note speak with remarkable rapidity and precision, and also to impart a peculiarly brilliant and agreeable quality to the tone.

There is a simple contrivance by which the power of *expression* is given. By drawing out the stop marked "expression," the wind communication to the reeds is cut off from the reservoir of the bellows, and opened to the feeders; by pressing the foot down, therefore, with different degrees of force, *piano* or *forte*, *crescendo* or *diminuendo*, may be obtained at pleasure.

Beside the stops named above, there are others of a mechanical nature: one called the *grand jeu*, which brings on the "full organ" at once; and another marked *forte*, which opens a sliding shutter to increase the volume of sound—something on the principle of the swell of an organ. The *sourdine* and *celeste* are also mechanical contrivances, by which the tone of certain of the

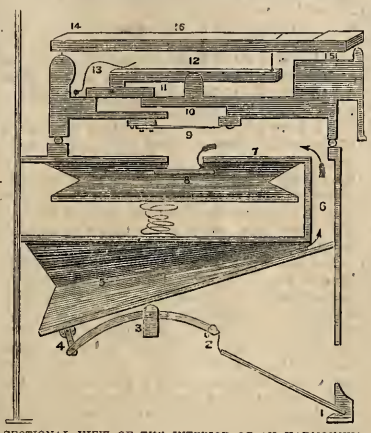
stops is modified, to produce variety. The quality of tone in all the stops depends, in some measure, on their positions, and on the arrangement of the wood cases in which they are enclosed, and which act, to some extent, as sound-boards.

The harmonium has been gradually brought to its present state of perfection, chiefly through the skill and ingenuity of Messrs. Alexandre and Dehain, of Paris. Considering its capabilities and power, the instrument is of small size, occupying less room than a cottage piano. Usually, it is about four feet wide by two feet deep, and three feet high, the size varying with the power of the instrument. For small rooms, the harmonium is very superior to the chamber organ, and



SECTIONAL VIEW OF THE INTERIOR OF AN HARMONIUM.

1. Pedal working on two hinges. 2. Catgut connecting pedal with lever. 3. Lever working on a pin. 4. Crank, working bellows. 5. Bellows. 6. Passage through which wind passes to wind-chest. 7. Wind-chest supplying air to reeds. 8. Reservoir to regulate the supply of wind to the reeds. 9. Reed. 10. Passage through which the air passes after setting the reed in motion. 11. Valve which prevents the wind from passing through the reeds until it is raised by the key. 12. Pin on which the valve works. 13. Metal spring holding down the valve, and regulated by a screw. 14 and 15. Pins on which the keys work. 16. Key opening valve.

far less expensive; and it is admirably adapted for use in small churches, chapels, schools, &c., for which purpose its clavier is expanded to seven octaves.

In the United States, this instrument is known as the *melodeon*, and has received important modifications and improvements at the hands of Mr. Jeremiah Carhart. He conceived the plan of acting on the reeds by suction instead of blowing, and reversed, to this end, the bellows and the reeds. He thus secured prompt sounding and a flute-like quality of tone; "voiced" the note by curving the reeds, with many other changes.

It may be necessary to explain why the stops are divided into *halves*: this is done because the sounds of each stop go through half the key-board only. Thus, if a stop be drawn on the right side of the instrument, it gives only *treble* sounds. If it be desired to continue the sounds in the *bass*, we must draw the stop bearing the same number on the left-hand side. Thus, although there are eight stops, there are, in fact, only four descriptions of sounds—the Flute being continued in the Cor Anglais; the Clarinette in the Bourdon; the Fifre in the Clarion; and the Hautbois in the Bassoon. It is not always desirable or necessary that the melody should be accompanied by a bass of exactly the same quality of tone, or *vice versa*. For instance, a melody may be played on the Hautbois (No. 4), and its bass, or accompaniment, on the Cor Anglais (No. 1); or a melody may be played in the bass on the Bassoon (No. 4), and a light accompaniment on the Flute (No. 1).

Character of the Stops.—Those on the right-hand, or treble side—1. *Flute.* This stop is very effective in melodies, and is employed for all music of a soft, tender character. In organ music, diapason movements are usually played in this stop: combined with the Hautbois, it imitates the human voice. Its proper bass is the Cor Anglais.

2. *Clarinette.*—This stop, when used for solos, imitates the instrument of that name: it sounds an octave lower than the actual note played; its natural bass is the Bourdon. Combined with the Flute or Hautbois, it gives the melody in octaves; or with the *Fifre*, two octaves apart.

3. *Fifre.*—This stop is an octave higher than the Flute: it is rarely used alone, except for echo effects. In combination with other stops, it sharpens the tones and imparts brilliancy: its natural bass is the Clarion.

4. *Hautbois.*—This stop imitates the instrument of the same name; its bass is the Bassoon: employed with the Flute-stop, it imitates the violin and human voice.

The stops on the left-hand, or bass side, of the clavier are—

1. *Cor Anglais.*—This stop forms the bass to the Flute. Melodies are very effective on this register, when accompanied lightly on the Flute.

2. *Bourdon.*—An imitation of the stop of the same name in the church organ: it is an octave lower than the Cor Anglais. It forms the bass to the Clarinette.

3. *Clarion.*—This stop is an octave higher than the Cor Anglais: it is of great utility, in combination with other stops, to strengthen a melody, and is sometimes used alone to produce particular effects: it is the bass to the Fifre.

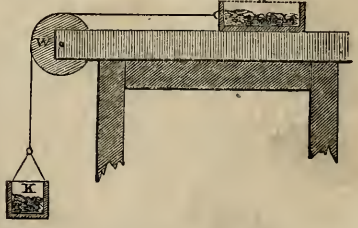
4. *Bassoon.*—A very pleasing stop. Employed with the Cor Anglais it imitates the baritone voice and the violoncello: it is the bass to the Hautbois.

* Continued from page 198.

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

It is recorded in the Memoirs of the incomparable Martinus Scriblerus how, in his eager pursuit of knowledge, he met with an extraordinary misadventure through the ignorance of his assistant, Crambe. Having secured the body of a malefactor, he hired a room for its dissection near the Pest Fields of St. Giles's, at a little distance from Tyburn Road. The body was carried by night, without much difficulty, on Crambe's back, who found it easy (being both young and lusty) to travel along the level road, carrying on his legs the double weight of the malefactor and his proper self. As soon, however, as he commenced to ascend the staircase, the increased exertion began to tell upon Crambe, and, as the accurate historian relates, upon the corpse also; in consequence of which, Crambe dropped his burden in disgust and fright, and allowed it to roll downstairs, while he ascended, breathless, into the upper room, where Martin, scalpel in hand, awaited the arrival of his expected subject. Crambe's failure in this important enterprise was caused by the sudden accession of Work, and consequent fatigue, the moment he commenced the ascent of the staircase. So long as he travelled on the level



road, with his burden on his back, he had to overcome the resistance of Friction or Traction, offered to horizontal motion; but as soon as he began to mount the stairs, he was obliged to overcome the resistance offered by a much greater force—viz., the united weights of himself and the corpse.

This resistance offered by weight to vertical ascent, I shall presently show to be about twenty-five times the resistance offered by Friction to horizontal movement. Under these unfavourable circumstances, it is not to be wondered at that poor Crambe's courage failed him; and that, finding himself unable to ascend with the alacrity required by the occasion, he quietly let go his hold, and rushed *breathless* into the presence of his master, being overcome completely by his unwonted exertions.†

* Continued from page 178.

† It is true that Mr. Pope gives a different account of the cause of this celebrated disaster, and one which absolves Crambe from the charge of having proved unable to carry the malefactor up a flight of stairs; but I have no hesitation in asserting that the explanation of the misadventure given by me is the true one.

If we attempt to drag a weight horizontally along a level road, we experience a resistance which is called *friction*, and are compelled to exert a force, in order to overcome it, which is called *traction*.

Let A (*see diagram*) represent a box containing a quantity of material, which, including the weight of the box itself, we may call *a*.

To this box we attach a string passing over a wheel, w, and having at its other extremity attached another box, K, whose weight is *k*, to which is gradually added sand or shot, until the weight *k* just commences to move the weight of the box A along the level table.

Let us now suppose that the box A has moved through any number of feet, say *x*: then it is evident that the weight *k* has also descended through the same number of feet, viz., *x*. Hence, the work done in transporting the box A through *x* feet is $k \times x$, and not $a \times x$, as might be supposed at first.

It has been found from many experiments that the proportion of *a* to *k* is different, according to the nature of the materials of which the box or wagon, and the road it is made to travel over, are composed. It differs, also, according to the kind of wheels or supports on which the box is lifted.

When the motion is one of simple *sliding* of one surface over another, the friction is greatest, and the proportion of *k* to *a* is also greatest; but if lubricating matter, as grease, be used, or if wheels be placed under the box, the friction or traction is greatly diminished.

Supposing the weight of the box A and of its contents to be one ton, the friction it exerts in sliding motion is given, from the best experiments, in the following table:—

TRACTION, EXPRESSED IN POUNDS PER TON, REQUISITE TO DRAW A LOAD ALONG A HORIZONTAL PLANE.

Combinations of Employers and Employed.†

LORD ST. LEONARDS' ARBITRATION BILL.

We have stated that workmen are now perfectly free under the law to enter into combinations for the purpose of raising wages or altering the conditions of labour; but any attempt to enforce the principles of such a combination upon other workmen, is an offence punishable by imprisonment, with or without hard labour, according to the circumstances. We will now adduce one or two instances of the application of this law, as it bears on the proceedings of Trades Unions.

The following instance may be taken as an example of a large class of cases:—One of the members of a Trade Union, whom we will call A, was working for a master who also employed other men, not members of the society, nor qualified by its rules, to do his work. A was censured by some of the members of his Union for working in the company of the others, and one of his fellow-members, B, threatened to use his influence with the society to turn A out if he did not leave. A disregarded the threat, and continued in his work. A meeting of the Union was called, and A was summoned to attend. The business of the meeting was to obtain a distinct answer from him as to whether he would leave his employment and remain a member of the Union, or abide in his service and be turned out.

At this meeting B took the chair. Another member of the society, C, who had been deputed to wait on A's employer, and endeavour to persuade him to conform his arrangements to the principles of the Union, reported the unfavourable result of the interview. A was then asked by B whether he intended to remain an honourable member of the Union, and leave his shop, or stay there, be despised by his club, have his name sent round all over the country in the society's report, and be subjected to other unpleasantness of a similar nature.

A remained firm in his determination to keep the employment, and an action was brought against B and C for infringing the Act 6 Geo. IV., which we have previously explained. The case was eventually argued in the Queen's Bench, and it was held that B might properly be convicted and punished for unlawfully, by threats and intimidation, endeavouring to force A to depart from his hiring. Against C, the evidence was not considered sufficient.

We have set forth this case as an illustration of the restrictions properly placed by the law against the inducing or compelling of any workman to act otherwise than he himself may see fit. Every man has the right to dispose of his labour, like any other property, according to his own choice, and the law will see that this right is uninfringed.

The rights of the employed being thus guarded by the law, it protects those of the employer in the same manner. A threat was made by D, a workman, in conjunction with others, that they would strike unless the master discharged certain other servants in his employ under particular terms. D was summoned for an offence against the Combination Act, and punished, as it was held that his threat was intimidation within the meaning of the statute, which makes it unlawful to endeavour to force a master to alter the conditions of his work.

While combinations of both employers and employed for trade purposes are permitted and recognised by the law, yet it will not enforce any agreement which may have been entered into, to carry out the principles of such a combination. All such agreements are held to be in restraint of trade, and prejudicial to the public interest. For this reason the law will not recognise nor enforce them. The following case is an illustration of this principle:—

Eighteen mill-owners had bound themselves together, by bond, not to open their mills until a certain strike among the operatives should have terminated. The penalty of £500 was attached, by common consent, to an infringement of the bond. One of the mill-owners at last opened his mill; and thereupon an action was brought against him on the part of the other mill-owners, to recover the £500 which was forfeited under the agreement. But the Court held that the bond was void, as being against public policy; and one of the judges expressed an opinion that the parties to it were indictable. The decision was appealed against in the higher Court, but there the judges were unanimous as to the illegality of the bond.

The principle here established of course applies to any understanding as to penalties and forfeitures among workmen in Trades Unions, &c.

In order to prevent the evils arising from strikes and combinations, the law has made provisions for the arbitration of disputes between masters and workmen. These provisions are contained in the Act 5 Geo. IV., c. 96, and subsequent statutes, and mainly consist of the following points:—

Any question in dispute as to wages to be paid for work done or being done, may be submitted, by consent of both master and workmen, to the arbitration of a magistrate, who is not himself a manufacturer or agent in the trade. All such matters as compensation for working a new pattern, or pieces of goods of unusual length, or the quantity to be contained in a piece, are expressly included within the scope of the Act. Or referees may be appointed to arbitrate on such questions, and in the event of their differing, a magistrate may decide. The decision of magistrates or referees may be enforced by penalties; and the parties who refuse to abide by the award or to pay the penalties, may be subjected to imprisonment or distress. At the same time, magistrates are not empowered to establish any rate of wages to be paid in future, without the mutual consent of both employer and workmen; and even in that case their award is only binding on the parties themselves who may agree to submit to the arbitration.

This law has rarely been put into operation, both masters and workmen having shown unwillingness to place themselves within its provisions. But the principle of arbitration is too important to be allowed to remain a dead letter in the law; and Lord St. Leonards has therefore introduced into Parliament a Bill designed to make arbitration between employers and employed more popular, and more generally resorted to in the settlement of their disputes. A brief outline of its provisions, on which the noble lord has earnestly invited the working men of the kingdom to express their opinions freely, will be appropriate here.

The Bill is entitled "An Act to Establish Equitable Councils of Conciliation, to adjust Differences between Masters and Operatives." It commences by referring to the Arbitration Acts to which we have just alluded, and does not design to repeal them, but to go *beyond* them in facilitating the settlement of disputes. It therefore enacts, in the first place, that if any number of masters and workmen shall, at a meeting convened for the purpose, agree to form a Council of Conciliation and Arbitration, and shall petition Her Majesty for a licence for such council, a licence may be issued, establishing a council of not less than two masters and two workmen, nor more than ten masters and ten workmen, who shall have all the powers of referees under the before-mentioned Acts. The masters petitioning for a council in any district must have resided and carried on their trade within that district for at least six months previously to the petition; and the men must have resided there for the like period, and worked at the trade, or calling, for seven years before signing the petition.

The council is to be elected by the persons who sign the petition, and to consist of an equal number of employers and employed. After election, the council is to appoint its own chairman, who must be some person unconnected with trade; and the chairman is to have a casting vote when the votes of the other members of the council are equal. The award of the council on any case in dispute is to be final, without review by any authority in the kingdom; and the penalties which attach, under the existing law, to failure to submit to an award, are to be equally enforced with regard to the council's decisions.

Not less than three persons—one a master, another a workman, and the third the chairman—may form the quorum of any council for the hearing of disputes and adjudication upon them.

A standing committee is to be appointed by each council, to consist of one master and one workman, and to be called the Committee of Conciliation. It is to be the business of this committee to endeavour to reconcile the parties and adjust their differences, before bringing the matter to the hearing of the council itself.

The council and chairman are to be elected in each district on the first Monday in November of every year; and every master who has resided and carried on business within the district for six months, and every workman who has so resided, and has worked at the trade for seven years, are to be entitled to vote in the election.

These are the chief provisions of Lord St. Leonards' Bill. It undoubtedly supplies a better framework for the adjustment of difficulties between employers and employed than is afforded by the existing law on the subject; and we trust that when its details and provisions have been fully discussed, both by the classes for whom it is designed and by Parliament, it will prove a means of healing many of the differences which we have so often to lament between those concerned in our national industry.

The Working Man, as described by the "Pall Mall Gazette."—"The artisan, as we should describe him, especially the Northern artisan, is a shrewd, dogmatic, thinking man, with much curiosity, and usually a rather prosaic appetite for scrappy facts of any sort, often excessively fond of the sciences of observation—botany and geology, for instance, rather than chemistry or mathematics (there are in Manchester many excellent botanists among the operatives); a man apt to be fond, like young men at college, of metaphysics and first principles generally; often with a taste for history, but if so, inclined to prefer authors who are at once dull and credulous of marvels, like Josephus, to better writers; crotchety and usually republican in politics; very sceptical in religion, or if not sceptical then a systematic Calvinist or Unitarian; quite the reverse of undomestic in family life, but apt to be arbitrary and hard; in a word, just what you might expect from men thrown early on their own resources, of very imperfect education, and with no harmonious culture, no developed sense of beauty, but still with vigorous, bold, and usually honest minds."

* The Limestone used was Portland stone.

THE METROPOLITAN AND PROVINCIAL WORKING CLASSES' INDUSTRIAL EXHIBITION.

On Monday, April 9th, a meeting of the honorary London agents and friends interested in the above undertaking was held at the Agricultural Hall, Islington, for the purpose of receiving a report from the Council, and discussing the various means which are being adopted to insure the success of the exhibition. From the report we learn that the scheme has been entered upon with considerable spirit, and will embrace sufficient novelty to give it a very distinctive character.

The exhibition is to take place at the Agricultural Hall, Islington, in September next, and to consist of contributions exclusively from workmen in London and the provinces. For the benefit of the latter the railway companies have liberally offered to return unsold goods free, so that the expense of carriage to exhibitors will be but half the usual charge. An attractive item in the programme is the fitting up of small workshops, supplied with steam power, where mechanical operations will be carried on in the presence of the visitors.

The professedly artistic element in these exhibitions has often been a source of pardonable ridicule; for although working men are evidently fond of occupying their leisure hours by drawing and painting, there are very few who do not betray a lamentable ignorance of the simplest rules of art. With the view of rendering some practical assistance in this direction, the "Lords of the Committee of Council on Education" will furnish a full illustration of the instruction afforded in the Government Schools of Art throughout the United Kingdom. These will, no doubt, be the best productions of the students, and may lead many to avail themselves of institutions of the existence of which they are probably at present ignorant.

The musical arrangements are of an extensive character, but will be chiefly confined to societies supported by the working classes. The Tonic Sol-fa Association are to organise six concerts of 1,000 voices each; and the Band of Hope Union, dividing their children into choirs of 1,500 strong, will also afford musical entertainment on several evenings. The instrumental music will be supplied by the volunteer, police, and other existing sources, and varied by occasional performances on the Great Exhibition organ.

The National Temperance League, the United Kingdom Alliance, and several other societies having for their aim the advocacy of the social interests of the industrial classes, will organise demonstrations for particular days, and in some cases receive a per-centage of the sum taken for admission; while the whole of the children connected with the parochial, Sunday, and ragged schools will be admitted to the exhibition, under the care of their teachers, without charge.

In addition to the above, lectures are to be delivered, and a flower show is to be held, while a large hall will be fitted up for the use of societies who may desire to hold meetings during the period the exhibition remains open. There are other matters referred to in the programme, including an Art and Industrial Union, to encourage the sale of the articles exhibited; but sufficient is here stated to show the character of the undertaking.

The report concluded by a statement that the honorary agents throughout the provinces had evinced a desire that their several districts should be well represented, and that the Council had received on all hands the most encouraging indications of success. It was also stated that Messrs. Houlder Brothers, the shipping agents, had offered to construct a full-sized emigrants' ship-cabin, thirty feet long, fitted with every requirement for a voyage to New Zealand, showing the accommodation afforded to workmen emigrants; also to collect a number of native implements and specimens of produce, illustrative of emigrant life in the colonies. That James McEwan, Esq., of Melbourne, who had started for Australia in January last, would present an address from the Council to the working men of the colony on his arrival, with the view of obtaining contributions from Melbourne. That an ode, written for the occasion by Mr. John Plummer, formerly a factory operative, was being set to music, under the direction of the Tonic Sol-fa Association, and would be sung at the opening ceremony by 1,000 voices. That Messrs. Ray, Mead, and Co., had offered to supply seats for 2,500 persons, free of cost, together with the use of a steam-engine for working a fountain. That a proposal had been made to purchase a lifeboat, by subscription, to be exhibited, and presented to the National Lifeboat Association in the name of the working men of Great Britain, and that Messrs. Cassell, Petter, and Galpin had kindly consented to act as treasurers, and receive subscriptions to the lifeboat fund.

After the reading of the report, the local representatives gave some account of what had been done in their various districts, and promised the undertaking their energetic support. An acknowledgment having been made to the agents, on the part of the council, for the spirit in which they had taken up the matter, it was proposed by Mr. Burgess, of Lambeth, seconded, and carried unanimously, "That this meeting has heard with satisfaction the arrangements already made for carrying out the proposed exhibition, and desires to express its entire confidence in the members of council who have undertaken its management."

Letters from Lancashire, by a Lancashire Lad.

VII.—OPERATIVE NATURALISTS, ETC.

One of the most notable characteristics of these humble students of natural science is the absence of all jealousy. Each one has at all times been ready to contribute what special information he may have had for the edification of those of his own class, or to the more widely known men who are recognised all over the world as authorities in scientific matters. It is worth observing, too, that frequently these men were first led to the study which proved the delight of their after life by a feebleness of bodily health, which made the ordinary rough sports of childhood impossible to them. By means of the societies which I described in my last letter, they could meet one another and compare notes, exhibit and exchange specimens, and in other ways give or obtain that mutual assistance, without which their energy and persistence in observation and study would have produced less noteworthy results.

It would be an easy matter to obtain sufficient information respecting these men, their lives and their works, to fill a volume; but I can only attempt a few brief notes, such as shall suffice to give to working men in other parts of the country some notion of their Lancashire compeers. John Mellor, James Crowther, John Horsefield, Edward Hobson, Richard Buxton, George Cayley, and David Dyson are the names of some of these men, each of whom deserves to have his life separately chronicled, and who all achieved great eminence in their peculiar studies.

John Mellor was born of poor parents, living near Royton, in 1767, and lived to be eighty-two years of age. His first occupation was handloom weaving, which he forsook for spinning on the jenny. When he was about thirty years old, he took the more congenial situation of a working gardener. He was indefatigable in his studies. Having exhausted the district in which he lived, he is said to have made annual excursions to Yorkshire and the northern counties, and afterwards to Scotland. Whilst on one of his Yorkshire rambles, the gardener at Wentworth introduced him to Earl Fitzwilliam, and he was always treated well, the earl frequently purchasing rare plants from him. Such was his ardent pursuit of his special science, that he is said to have traversed the Highlands of Scotland six times, ascending Ben Nevis, Ben Lawers, Ben Lomond, the Bredalbane, the Clova, and several other mountains. The plants collected by him in these rambles he took to Edinburgh, and amongst other botanists who were indebted to him for specimens, was the late Sir W. Hooker. These Scotch rambles were not free from danger. Having visited Edinburgh and Glasgow with specimens for which he obtained some £13, he left the latter place, and, fancying one of his pockets was likely to have a hole in it soon, he tied three of the sovereigns in a knot in the corner of it. It was fortunate that he did so, for on approaching Kilmarnock he was knocked down by two highwaymen and robbed of the ten loose sovereigns; but the three tied in the corner escaped notice, and he was able with them to reach home. Such had been the temperate conduct and the healthful occupation of this man, that up to a week of his death he could work in his garden. The respect with which he was regarded was evinced by the number of botanists of his own rank in life who came from various parts of Lancashire and Yorkshire to attend his funeral.

James Crowther was born in a cellar in Deansgate, Manchester, in 1768. His father was very poor, and, after such schooling as could be given to him, James went to work as a draw-lad at petticoat-weaving, when he was nine years old. He commenced his study of botany when he was very young, and soon joined a botanic society, consisting entirely of working men, who met together once a week during the spring and summer months. It was not an uncommon thing to have over forty of these men at one meeting. Frequently, after finishing his day's work, Crowther would start on a journey of fifteen or twenty miles, to some place where he expected to find some plant of which he had been informed. Sometimes he would reach the place by dawn, and manage to return in time for work next morning. Sometimes he was encountered by gamekeepers, and was treated as a poacher. He often escaped them by means of his fleetness as a runner. He discovered many plants and insects new to his neighbourhood. He was frequently accompanied in his rambles by one or other of the working men, who, like him, were addicted to these botanical studies. Sometimes Edward Hobson or Richard Buxton would be with him, and they frequently got into scrapes, or played bits of practical jokes with each other.

The perseverance and energy of these men in their quest for rare specimens was such as to give them all the excitement which others find in seeking the tail of a fox. Once Crowther and John Dewhurst were out—at Mere, in Cheshire—and suddenly the former gave a great shout, and threw his hat high in air. When Dewhurst turned round, Crowther told him he had found a new plant—a perfect gem. It was the *limonella aquatica*. Great excitement prevailed amongst their friends respecting this plant. Hobson said he would not believe them, unless he saw it growing. Crowther took him to the mere where he had first seen it, but, unfortunately, frequent rains had so swollen the lake, that the plant was a considerable distance under water. Feeling for his friend's disappointment, Hobson commenced botanising in the fields about, and, whilst doing so, he heard a plunge in the water. Turning round, he found that Crowther had disappeared. Rushing to the bank in alarm, he was in time to see his old and drenched friend emerge from the water with the precious specimen in his hand. Many writers upon botany were indebted to him. His steadiness may be assumed from the fact, that he was employed as a porter by one master for twenty-five years, and by another for sixteen years. In his first place he had 16s. per week, in the other £1. So long as his wife lived, he gave his wages to her for the support of herself and his children; and after he had done his regular work, he would go down to meet the Duke of Bridgewater's packet, hoping to earn a little money by carrying a parcel for one or other of the passengers. The money he earned this way was devoted to his scientific pursuits. The story of his acquaintance with Sir James Edward Smith has been told before, but it is worth repeating. When Sir James was at work upon one of his books, he was staying with his friend, Roscoe, the historian, at Liverpool. By chance, he mentioned to Mr. Roscoe that his book was being delayed from the want of information respecting mosses and lichens, and his friend at once recommended him to see some of the Manchester weavers. Sir James is said to have ridiculed the notion at first, but afterwards he acted upon it. He came to Manchester by canal, and asking for a porter to carry his carpet-bag, old Crowther himself was engaged. As they walked towards the hotel, Sir James asked his porter if he knew a man whose name he mentioned. "Oh, yes," said Crowther, "he's a bit in my way." Sir James asked what way that was, and obtained for reply that he was fond of collecting mosses and lichens. They went on to the hotel, and in the conversation which they had there, Sir James obtained all the information he wanted. In his old age, Crowther was very poor. His children were married, had families of their own, and could not do much for the support of their father. In this extremity he had to part with almost all his plants and insects. He suffered at once from mental and physical debility. Some few gentlemen subscribed to contribute a small sum weekly—about 5s.—which kept him just outside the workhouse. This was done for about eight months, and then it was discontinued, because the "Society for the Relief and Encouragement of Scientific Men in Humble Life" had commenced operations. Unfortunately, the society only allowed him 3s. per week. It is rather sad to have to record the fact, that, whilst he was supported so meagrely when living, so soon as his death became known, a subscription was started, and very rapidly £7 was obtained to bury him, and to place a stone above his grave. I don't like to comment upon this conduct; it reminds me of the epigram written upon the monument of the author of "Hudibras"—

> "While Butler, needy wretch, was yet alive,
> No generous patron would a dinner give.
> See him, when starved to death and turned to dust,
> Presented with a monumental bust.
> The poet's fate is here in emblem shown—
> He asked for bread, and he received a stone."

Crowther died in 1847, aged seventy-eight.

MONEY PRIZES,
TO BE COMPETED FOR BY
WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

The People and the Picture Galleries.

Organisation is a great thing. It is a triumph of progress in itself. Union implies sense, self-denial, and clearness of purpose; and the working class are to be congratulated on the possession of it which they display. It only requires to be put to great uses to accomplish results of the most advantageous description.

In every form, and in almost every town, artisans are coming to the front, by the agency of Co-operation. It is a strange fact that no Trades' Union has hitherto attempted it. Co-operation is now known to be a power which makes workmen rich, while strikes frequently make them poor. Last year the Co-operatives of Rochdale made £25,000 in profits. When did the Trades' Unionists of any town ever make that sum by strikes, clear of all expenses, having the money well saved up and invested? We have heard of them losing it; we never heard of them gaining it. We do not now intend to discuss the losses or gains of strikes. There is a principle in strikes which must not be confounded with mere loss or gain; but since gain is, without doubt, the main object of a strike, it is fair to ask, "How is it, then, that gain by Co-operation has never occupied the attention of any Union?" Since, however, artisan societies now see their way to improvement by Co-operation, it is, we repeat, curious that a Trade's Union, usually in advance of its compeers in sagacity and intrepidity, should not. There are reasons for this, but we should feel inclined to put them down among unreasonable reasons, if such a classification exists. We heard a member of Parliament—one of the foremost friends of the people—express, on the fact being mentioned to him a few days ago, the greatest astonishment at such a state of things.

The point, however, we have in view to suggest is, that Trades' Unions should raise themselves to a level with schools, colleges, and general social institutions, and arrange to visit in bodies public exhibitions of interest. For instance, there is the Hildebrandt Gallery of Drawings lately opened in Piccadilly. It is closed at present, but will be re-opened in May. It contains upwards of 200 drawings, made by the greatest German water-colour painter who has appeared—Herr Hildebrandt. Carl Werner is a distinguished German painter in water-colours, but inferior in individuality of treatment and mastery of tone, to Hildebrandt. But this is an artistic, rather than a public point. The interest of this exhibition to the public is, that Herr Hildebrandt has travelled over the hitherto unknown worlds of China, Japan, and Manilla, and brought home transcripts of scenes, of which few travellers who had reached them had returned to tell the particulars, and certainly no painter ever beheld them who had the intrepidity and skill to depict them as this artist has done. Mandarin and jolly-boat, junk and pagoda, river and street, land, and sea, and sky, the golden sunset and the dread typhoon, the bright light without heat, and the heat without air, the objects and aspects of Nature, are caught and fixed by Hildebrandt's educated eye and wonderful hand. There is the Street of the Pirates, the Coast of Pokofooloon, Cowloo and the dreamy Pearl River, the Chinese Wall at Bonatigris, the wonderful City of Pekin, looking as though built at the bottom of the sea; the blue porcelain-domed Temple of the Heavens, Silk Streets and Circular Streets, resplendent with colours unknown to us; the Coast of Japan, Nagasaki, Jakohama, the Sacred Mountains of Fusi Jama, all painted with matchless reality, giving the splendour of Nature without its poetry; presenting not what an inspired artist saw, or thought he saw, in some exceptional moment which will never occur again, and which no other eye save his would see if it did—but what the observer will be sure to see if he should visit these wondrous and remote places.

This exhibition is lighted with gas at night. There are other exhibitions—such as the Dudley Gallery, and the collection of Water-Colour Paintings, of purely English interest, at the Egyptian Hall—also lighted up in the evening. Why should not Trades' Councils call the attention of their members to these places, and arrange that they and their wives and grown-up children should visit them? If they went in large numbers, four, or even six persons, could obtain admission at the price of one. Artists, foreign and British, would be proud that working men should take an interest in their works. It would be in the power of Trades' Unions thus really to encourage art, and cheer very often the spirit of the artist.

One effect of the people going to see works of art would be, that the character of works of art would improve. Now our great exhibitions, amid many pictures of beauty and memorable worth, have great spaces occupied with vapid, conventional, purposeless subjects, which it can do no human being good to see. Now and then a Maddox Brown, a Holman Hunt, or some similar-minded artist, ventures to paint what ought to be painted. Mr. Millais has done so occasionally, giving us some tragic or instructive incident of real life. How many more would do this if the public went to see the works of artists. If *Punch* once had its "million moralities," how much more ought our canvases and panels to have them. Some of our greatest animal painters have given us cowardly and painful pictures. Indeed, pictures are generally painted for those who come to see and buy them. You may know who mainly frequent our exhibitions by the fashionable and meaningless compositions which hang upon the walls. We are quite aware that art is art, apart from any lesson it conveys. But some great painters have, in all ages, painted great lessons as well as great pictures, and this would be, and might be, more the case than it now is, with every advantage to art as well as social progress. The daily life of the people furnishes instances of interest which few painters care to delineate. They ransack imagination and books for subjects, and leave the vast stage of social life, on which countless dramas are being played, unnoticed before them. If our working men would go in the way we suggest to picture exhibitions, this deficiency of taste would be rectified; and, apart from the pleasure and instruction they and their families received, they would assist in exalting the character of their order, and really promote the interests of art, by bringing to bear upon it an influence which, in no age or country of the world, has ever yet been attempted.

The Co-operators of Rochdale buy the best optical instruments, the best books of travels, the best maps, the best dictionaries and books of reference, and are among the ready patrons of our best literature. Working men who were helpless a few years ago, now send their agents into the money markets. Trades' Unions invest in the funds, and have a place among the little millionaires. This was incredible when the present generation was yet young. Co-operators are building public halls, as they have done in Brighouse, Burnley, Salford, and elsewhere. They have newsrooms and libraries; one day they will want pictures to adorn them. They will go to galleries to select paintings; they will one day give commissions; they will become picture-buyers. Mr. Lowe, Mr. Horsman, Lord Elcho (who is himself a distinguished connoisseur in art), and others of the same class, know not all that is in the heart, and near the realisation of the people. When the day comes, artists will learn to paint for the people. There was a time when authors wrote for the few, just as painters now paint for the few. Now authors write for the many, and literature is all the better for its million patrons, who render the author independent of all other patrons, and call out all his whole genius. So it will be with art one day, when the people turn their attention to it.

Social Meetings for the People.—The promotion of friendly social intercourse between working men and persons in other ranks, of greater culture, has always been one great benefit which the promoters of Working Men's Clubs and Institutes have desired to see them accomplish. To exemplify the value of such interchange of thought and sympathy, and to stimulate its development throughout those societies, the Council of the Working Men's Club and Institute Union propose holding three social meetings, in the Lower Hall, Exeter Hall, on the plan of those which were found so profitable and agreeable last year. The dates of these meetings, and the subjects discussed, will be as follows:—April 18: How far are the Disadvantages under which the Working Classes labour attributable to Causes within or beyond their own control? First speaker, Mr. John Bainbridge; chairman, the Right Hon. the Earl of Lichfield.—April 25: Would a Large Extension of the Franchise promote the well-being of all Classes of the Community? First speaker, Mr. Cyrus Symons; chairman, the Right Hon. Lord Lyttelton.—May 2: Is it the Duty and Province of the Government and Local Authorities to assist the Industrial Classes in providing themselves with Better Dwellings? First speaker, Hodgson Pratt, Esq.; chairman, A. H. Layard, Esq., M.P. The rooms will be open each evening at seven p.m. for general conversation. The chair will be taken at eight p.m., when the subject for the evening will be introduced; after which free discussion will be invited. Each person sending up his name to the chairman will be called on in turn, ten minutes being allowed to each speaker. No resolutions to be moved, nor votes taken.

The Artist Workman.

THE VALUE OF ART EDUCATION AS A MEANS OF INCREASING WAGES.

"It has been discovered," said Mr. Stewart, at one of the annual meetings of the Social Science Association, "that a public able to appreciate is as essential as are designers able to produce; but it is not yet felt that ignorance of art diminishes wages, and injures every woman's household. It is admitted that for decorators, pattern-drawers, lithographers, engravers, carvers, mould-makers, sign-painters, and the like, art education is valuable; but it is not yet believed that the basis of all art—a knowledge of form—is as valuable to the chair-maker, the tailor, the boot-maker, the glover, the hatter, the turner, the coach-maker, the baker, and the pastrycook. The man who can letter sign-boards earns better wages than he who can only white-wash ceilings; and the principal difference between the two is, that the one has cultivated his sense of form till it yields him so many shillings a week more than his neighbour, who has allowed his faculty to lie fallow. If it be admitted that forming the letter G upon a sign-board and forging a horse-shoe—that the forming of a vase-backed chair and drawing a 'pine' for a shawl-pattern—are precisely similar acts in different materials—that is, different developments of the same elements of form; if it can be demonstrated that what is called neat-handedness in artisans is only a clearer perception of that, little more or less, which constitutes the difference between clumsiness and elegance, and that these neat-handed tradesmen everywhere receive higher wages for their work; then it can be proved that this alphabet of the art—the knowledge of form—has a most important bearing on the wages, the comfort, independence, self-respect, social position, and public worth of the working classes."

Compare the position of the working man capable of producing, or even simply imitating the graceful and suggestive design which forms our illustration with that of the common labourer. It means not merely a difference of wages and comfort, but a difference of resources. The unskilled labourer will always be a labourer; but the skilled workman, possessing a knowledge of art, will gradually be enabled to procure the highest rate of wages obtainable in his trade, or to work his way into some other and more profitable occupation, in which there existed a demand for his services. His course would often be upward, seldom downward.

Dry Subjects.

Beauty itself is still in dispute. Nobody has defined it. The line of grace is, as yet, undetermined. Gibson's tinted Venus divides the opinions of all the art-critics. Who, then, shall tell us what is interesting? People are sensational to arrive at it; they plunge into melodrama to attain it. Political economy is a very great subject: it has changed the destinies of modern nations; but no writer, from Adam Smith to John Stuart Mill, ever made any fragment of political economy as interesting as Punch and Judy. What Englishman is there who does not or has not enjoyed the sight of the active hunchback scolding, chattering at, or banging his comical and vivacious companion? Poor Toby, too, touches the heart of all children. Yet there is as much interest in science as in comedy, when people are thoughtful enough or cultivated enough to see it. One may easily believe in Newton weeping for joy, when he saw some abstruse calculation come out which proved the truth of an unknown law. The dreary-looking columns of figures were as full of poetry as the verse of Homer. A mathematical figure, or a series of algebraical symbols, are, to those who understand them, as beautiful as a song. It all depends upon the bent of the mind. The step of Elssler, or the notes of Lind, charm only the cultivated. Political economy will one day be generally interesting, as the working class come to see and understand its applications. James Mill infused into it a bolder tone than Adam Smith; John Stuart Mill imparted to it a human element it never had before he wrote. Much depends upon the way of putting it. As Heine humorously exclaims:—

"When first my afflictions you heard me rehearse,
You gaped and you stared—God be praised 'twas no worse!
But when I repeated them smoothly in rhyme,
You thought it was 'wonderful!' 'glorious!' 'sublime!'"

This kind of change will come over the popular judgment of social science as general intelligence is diffused.

In Professor Fawcett's work on the "Economic Position of the British Labourer" are a series of ideas and principles, of the utmost importance and interest, now capable of being quoted by working men. The possibility of the labourer ceasing to work for hire is allnded to. This is almost the first admission of its possibility which we have seen. What a new horizon of industry is here opened! What utterly changed relations of society does this imply! Then poverty and serfdom will terminate. This change lies in the immediate future. We are rapidly moving towards it. Labouring for hire is coming to an end. Mr. Mill has foreshadowed it; Mr. Fawcett has admitted it; all Co-operation tends to it. Every week we are enabled to record the conversion of private manufacturing firms into Co-operative companies, and the rise of Co-operative manufactories, in which the workmen are their own employers. The change is coming even faster than workmen are prepared for it. At the present time the Society of Amalgamated Engineers might become possessed of great iron works, but their rules prevent them using their capital in this way. The workmen have not yet made the rules which will permit them to advance.

The aggregate land of the country is rapidly passing into the hands of a few proprietors. Only a century ago there were three times as many landholders in England as there are now. The British freeholder is dying out. The territorial aristocracy, which was once the mainstay of England, as it now is the mainstay of America, is ceasing. Property itself has changed character, as far as the people are concerned.

Primogeniture is beginning to be considered a national evil. At any rate, it is extremely questionable whether a man ought to be allowed to entail his landed property so that it cannot be sold, or divided equally among his children. If a landowner dies without a will—that is, intestate—the law acts on the principle of intestacy, and apportions the land to his eldest son. This locks up land. It prevents it coming into cultivation in the most efficient way. It tends to prevent the existence of a class of small proprietors, and keeps up a class of more dependent and less public-spirited tenant farmers. Nowhere is there so much thrift, prudence, industry, and self-respect to be found as among the small proprietors of European countries. It seems absurd to devote constant homilies to the inculcation of industrial virtues among the people, and withhold conditions which will produce those virtues without homilies. The principle of public economy is becoming a ruling principle. Changes in the law to promote it are inevitable. Waste, improvidence, inequality, social injustice, social neglect, privileges of rank, indefensible usages, however immemorial or time-honoured, all have to give way before public economy. If, for instance, Government can do nothing, or are unwilling to do anything towards creating peasant proprietorships, Professor Fawcett shows that it is bound to do nothing to obstruct their creation.

England is a rich country. It has enormous wealth. Every country on the face of the earth is in receipt of English capital. England supplied £13,500,000 to the Grand Trunk Railway of Canada, while the United States altogether scarcely subscribed £500,000. Thirteen millions from England to £500,000 from America is an amazing instance of commercial affluence. Since 1853 we have invested £43,000,000 in Indian Railways. Out of all this profusion of surplus wealth comes the moral impression that there

only wants a little more industrial sagacity and social science to place the "British Labourer" in a position of secure competence. These and many more lessons, not wanting in popular breadth and interest, are furnished in Professor Fawcett's small book on "Economic" Science.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

As the discussion at the last monthly tea-meeting of the Secretaries of London Clubs turned entirely on the subject I dwelt on in my last paper, viz., *How to deal with the Youths*, I cannot do better than mention some of the useful remarks and experience then afforded to the meeting, before resuming the notice of various Clubs more or less unsuccessful, commenced in a former number.

The chairman having inquired the views of each person present, in turn, as to the age at which they thought persons might be admitted as members without prejudice to the club, six representatives mentioned "eighteen," but four of them, admitting that applicants for admission constantly falsified their age, urged that measures should be taken to prevent any coming in who had not actually attained that age, either by requiring older persons to certify the fact, or by making the nominal age twenty-one. One secretary considered none should be admitted unless they had actually attained the age of twenty-one; another named twenty-two, and another urged twenty-three. Several maintained that none under twenty-five or thirty, even though admitted to the club, should be allowed to use the bagatelle-room, as, independently of the noise younger men made when playing, it had too often happened that youths came to a club, learned to play at bagatelle, became passionately fond of it, and then got into the habit of playing at public-houses, for money or beer. It was also recommended by most of those present that no persons under twenty-one should be admitted, if at all, without a recommendation, or (as at the Southwark Club) unless two adult members agreed to be answerable for his good behaviour. (This last suggestion carries us back to the admirable institutions of Alfred the Great, and has great virtue in it.) One speaker ably contended that it was really a question of good management, saying that men do not object to the company of *well-behaved* youths, but quite concurred in the exclusion of the latter from the bagatelle-room until their characters were comparatively formed—say, twenty-five years. In judicious management, wisely blending firmness and kindness, would be found, he thought, the solution of all these and similar difficulties. Most, however, agreed that men would not keep company with the youths; but the representatives from Camden Town and St. Bride's considered that grown men did not object to the company of youths as young as sixteen or eighteen. One speaker urged the great importance of not allowing any member under the age of twenty-five to be on the committee; otherwise, as was the case at one time in the club he belonged to, the youths might get completely the upper hand, and do great mischief. The representative from Chelsea (Mr. Taylor) said they admitted them at the age of eighteen, provided, as long as they were under twenty, some members of the committee took them under their special charge. At that club they had twenty-four on their committee, and four of them took it in turn to be there every night; hence such a thing as disorder and noise was quite unknown among them. He maintained that, unless youths are admitted as young as eighteen, they go to the bad before they are admitted to the club. Many youths who used to play bagatelle at beer-shops in the neighbourhood of this club never go there now, but play at the club instead, and without betting or noise. None, however, are allowed to play twice until all who wish it have a chance of playing once. The representative of another club urged that there was no possibility of keeping youths out of the bagatelle-room till they had reached a given age. The great point was to let them amuse themselves as they liked; but to be continually taking opportunities of leading them on to care occasionally for something higher and more improving.

I then dwelt on the original and fundamental idea of a Working Men's Club, viz., that of a society of grown men for promoting that social intercourse and pleasant fellowship among themselves which the wealthier classes get at each others' homes, or at their clubs, but which working men are driven to seek at the public-house. I urged that husbands and fathers of families, men of ripe years and experience, often wished for chat with one another on many subjects of interest, in discussing which they certainly did not desire the company of lads and youths as listeners. Of course, I fully recognised the vast importance of providing a place of resort for the latter, but suggested the various expedients mentioned in my last paper; and contended that where youths were admitted indiscriminately to a club, without any of those precautions, it might be doing a great deal of good in some other way, but it certainly was not answering the purpose for which Working Men's Clubs were and ought to be established. The secretary of the Southwark Club (Mr. Symons), in a very able speech, then summed up the discussion. He believed that if clubs could be formed and maintained such as I had described, to which none should be admitted under the age of twenty-five, they would be a very great success, and would meet an extremely urgent want. Perhaps they might be best supported in large towns if each trade had its own club. At all events, he much wished to see clubs that would really belong to, and be used by, grown men exclusively. He strongly confirmed, by various illustrations from his own experience, the statements made as to the absurdity of expecting grown-up men to talk familiarly with one another in the presence of youths. What they said would be sure to be misunderstood, or be repeated, perhaps misrepresented. Very likely it would be all over their workshop the next day, or they would hear of it in their families, perhaps in the streets. In every point of view, it was most unpleasant and objectionable to have lads listening to their talk. For these reasons he would like to see in every club at least one room where men could be by themselves. But he could not consent to exclude youths altogether. And in the present state of the movement, and of his own club in particular, he felt that he would rather labour to save those whose characters were not yet formed—who were under the age of twenty-five—than older men; for he had seen the wonderful good done to these young fellows by admitting them to that club. He would employ, however, various safeguards. He had got power from the committee to suspend any member guilty of disorderly conduct until the next committee meeting, and the youths knowing he had this power, now behaved much better.

(It was mentioned, by-the-bye, in the course of the evening, that the steward of the Holloway Club had the power entrusted to him of turning out any offender for the night, but had never had occasion to exercise it—partly, perhaps, *because* he had the power—partly, no doubt, because of his firm, yet genial, manner with the members.)

Mr. Symons farther mentioned that they had passed a rule making youths only "*associates*" until they attain the age of eighteen, so that they would have no power in managing the club, or rather mis-managing it, as had formerly been the case. He also suggested that, where there was a great demand for admission on the part of youths, the committee might require them to show a certificate from the secretary that they were in the habit of attending some class or lecture, and of conducting themselves respectably, before giving them a ticket of admission to the bagatelle-room. This, however, would require a great deal of tact and good management, but in some clubs he thought it would work well. He wished they were as fortunate as the members of the Chelsea Club in having so many staunch and competent members of committee to take it in turn to attend every evening, and so many popular gentlemen to help work the club and make it both pleasant and useful. They had only one of this class, their president, Mr. Seaward Tayler, to whom they were under the greatest obligations; but he lived a long way off, and of course could not be very often there.

Commending the above remarks, and those offered in the last number of the Working Man, to the thoughtful consideration of all the managers and friends of Working Men's Clubs and Institutes in dealing with one of the gravest subjects that can engage their attention, I propose resuming the notice of various failures in different parts of the country.

* Continued from page 227.

The New Artificial Stone.

In an age when large public buildings are either being, or in contemplation of being, constructed, not only in the British metropolis, but throughout these kingdoms, it is of the greatest importance to have at our command a material possessing, in high combination, the properties of beauty, strength, and durability. This is the case with the new patent concrete stone invented, after many years of study, toil, and experiment, by Mr. Frederick Ransome. Architectural taste has proclaimed its beauty; practical experience has pronounced its strength to be superior to that of the best product of our Portland quarries; chemistry has declared that it will rival in endurance the old unchanging mortar of the Romans; whilst natural philosophy has pronounced it the *ne plus ultra* of artificial stones. An invention thus spoken of, in connection with one of the most important of the constructive arts of civilisation, can hardly be too widely made known.

The various compositions which have, from time to time, been invented to take the place of natural stone, by substances which should possess the advantages of either being less expensive, more convenient, stronger, or more durable, than any material that can readily be obtained in the locality where stone is required, represent a considerable numerical amount; but the artificial stones hitherto used may, with sufficient clearness, be comprehended under one of these three heads—Terra-cotta, Cements, and Siliceous Stone. The *first* consists of certain manufactures of plastic clay, burned in a kiln; the *second* consists of various manufactures of limestone containing foreign ingredients of such a description that, when converted into lime by burning, the lime thus operated upon possesses, when wetted, the property of setting gradually and firmly; the *third* until recently has been obtained by burning in a kiln sand and other substances, moulded with a solution of silicate of soda, which is converted into a kind of glass, firmly connecting the particles with each other.

Besides these there are the different *plasters*, which, however, being little exposed to the trying effects of weather, may here safely be left out of consideration.

Terra-cotta, like many other of the inventions of man, has its advantages and its disadvantages. The former are its cheapness, abundance, and the universal distribution of the clays of which it can be made; the facility with which it can be moulded to any required form; and its usually agreeable colour when uninjured by long exposure to the variations of the atmosphere. These may be regarded as the sum of its advantages. Its disadvantages are, the uncertainty which attends its use, owing to the great and unequal contraction of all clays in burning; its want of resistive power in repelling damp and frost whenever there is the slightest flaw, whether produced before or after burning; its brittleness and want of strength, and its liability to be covered with a disagreeable green vegetation in damp air after a few years' exposure to the weather. For dry climates it is better adapted than for wet.

Cements, no matter of what description and how called, when intended for building purposes, are all similar in their nature. The advantages of this material, when used as an artificial stone, are—its cheapness where made, and its facility of transport; its not requiring the kiln, but setting at once without contraction; the case with which it can be moulded, and its great strength when well made. These are its advantages. Its disadvantages are, that it cracks and peels off when subjected to the influence of frost and damp air; the uncertainty of its manufacture, some specimens yielding a much harder, better, and more lasting stone than others, without any apparent reason; and its sharing in the offensive green vegetation of the terra-cotta. Notwithstanding these drawbacks, however, it is well adapted for making concrete.

Siliceous stone, or patent concrete stone, as now manufactured by Mr. Ransome, has the advantages of being extremely uniform in its texture; of being made of material abounding in Nature, and almost in every locality; of being capable of being imme-

diately manufactured on the spot where it is required to be used, and of the exact forms desired; of being alike applicable to solid constructive masonry, and to the most elaborate and beautiful embellishments; of resembling, both in texture and appearance, the best qualities of our natural stone; of having the capacity of being produced to any shade of colour; of there being no waste incurred in its manufacture; of giving the power of being formed into stones hollow as well as solid; of being totally unaffected by the acid vapours of manufacturing towns, or the changes of the atmosphere; of increasing in hardness, and consequent durability, with the lapse of time; and of having great strength, which has been proved to be superior to that of Portland stone, or, in fact, to any of the natural stones with which it has been tested. These are the advantages of Ransome's patent concrete stone, and its disadvantages must now be spoken of as things *of the past*. These *were*—its cost, which was greater than for either of the other kinds of artificial stone, but which, considering its overwhelming advantages, could hardly be estimated against it; and its being subject to a white efflorescence of salt, which has now been successfully obviated.

As this stone has already been extensively employed in the several stations of the Metropolitan Railway, in the London, Chatham, and Dover Railway Extensions, and elsewhere, we may be excused for any curiosity we might exhibit in desiring to be made acquainted with the nature of the ingredients of which it is composed. It was in 1856, whilst pursuing other experiments, which had reference to the *preserving*, and not to the *making*, of stone, that Mr. Ransome hit upon his discovery. Like Palissy, the potter, he had laboured long, and was at length successful. After this he was very soon able to satisfy himself that two solutions—namely, silicate of soda or potash, and chloride of calcium, common sand, chalk, clay, and other almost valueless earthy or mineral matter—could readily be converted into a useful and durable material; and accordingly, in 1861, he obtained his patent for the manufacture of stone by such means. The process of his manufacture has been thus described by himself to us:—

"The sand, chalk, or other mineral substance, is intimately mixed with its proper proportion of a solution of silicate of soda. This is effected in an ordinary pug-mill, and the mixture, which is thus rendered of a plastic consistence, is either pressed into blocks or moulds, or can be rolled into slabs, or forms as may be desired, and is afterwards either saturated with, or immersed in, a solution of chloride of calcium, when a double decomposition of the two solutions employed (the silicate of soda and the chloride of calcium) immediately takes place. The silica combines with the calcium, and at once forms an insoluble silicate of lime, firmly enveloping and cementing together all the particles of sand, chalk, or other mineral of which the stone is composed; whilst, at the same time, the chlorine combines with the soda, and forms chloride of sodium, or common salt, which is easily removed by subsequent washing."

Such is the simple process by which this now celebrated material is produced, and such are the simple ingredients of which so much artificial beauty, strength, and durability are composed. The cost of its production in plain blocks or slabs, in most cases, is *less* than that at which natural stone can be obtained; whilst for mouldings, or any kind of ornamental masonry, the additional labour in working the material is so trifling as scarcely to be worthy of notice. The principal item of expense in such work is the preparation of the necessary moulds; but as these may be made either of wood or of plaster of Paris, they need by no means be costly; and where a repetition of the same article to any considerable extent is required, the proportionate cost of the mould chargeable upon each article would scarcely be appreciable.

Here, then, is a most useful composition, which bids fair to rival or supersede to some extent the uses of both stone and bricks for building purposes. It has neither to be dug nor quarried from the bowels of the earth, but is made upon its surface, of what may be almost deemed as the refuse of Nature; and, by the practical application of a little chemical knowledge, that which has hitherto been held as valueless is at once converted into the means of supplementing both clay and stone in the construction of our towns and cities. For such purposes timber may be said to have failed to supply us long, long ago; superficial clays may, in the course of time, be worked out; and stone has, in some parts, never been abundant. In London this has especially been the case, and hence the vast conglomeration of bricks and mortar which the walls of that city present to an eye unused to such exteriors. This, however, need no longer be the case. The inventive and applicative genius of man seems to be limited only by the term of his existence. Even the powers of the natural world would almost seem to have ceased to contend with him. In the locomotive he has beaten the speed and the endurance of the swiftest and the strongest of animals; in the flash of the telegraph he has become the co-equal of the lightning; and in the invention of this new "concrete" he has surpassed the beauty, the strength, and the durability of the natural stone. In it he has set the influences of time and weather alike at defiance, and can now erect monuments equally vast, solid, grand, strong, and enduring as those Pyramids, which, for 3,000 years, have flung their silent shadows over the desert sands of the Egyptian land.

THE SONS OF LABOUR.

Apollo's lyre hath oft been strung
To kings' and princes' glory;
The poet's voice hath pæans rung,
To warriors grim and gory.
The god of love, the god of wine,
The world for aye is praising;
To woman—more than half divine—
The goblet ever raising.
But I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour:

Our hero be the working man,
No matter age or station,
Who ever stands among the van,
To help himself and nation;
Whose hand, or brain, or both combined,
From duty never falters—
The man of heart, and soul, and mind,
Who never shirks or palters.
Yes, I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour.

Who raised our empire to its height?
Earth's rarest Queen—who made her?
Those men, who fought no bloody fight—
The toiler and the trader.
The field of commerce is the sphere
Where most she stands the winner—
Thanks to her miner, engineer,
Her weaver, and her spinner.
Yes, I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour.

The nations that by conquest rose,
By conquest oft were humbled;
On ill-got gains they dared repose,
Till native vigour crumbled.
But Britain's greatness, surer laid,
Hath stood the shocks of ages,
And everlasting record made
On History's golden pages.
Yes, I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour.

In darker days 'twas thought unwise
To give the people learning,
Lest they their rulers should despise,
And honest toil be spurning.
But mental light new worth infused,
And, in his better hour,
The working man has fairly used,
And not abused his power.
Yes, I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour.

The working man hath done his part
Both honestly and boldly;
He hath a loyal, loving heart,
Then never treat him coldly.
Ay, trust him still, and trust him more,
And you shall see him growing
Still sounder, better than before,
With highest impulse glowing.
Yes, I another strain would wake—
Join with me, friend and neighbour—
For truth and for old England's sake,
Let's sing the Sons of Labour.

John Geo. Watts.

Government Life Insurance.

Of the many services which Mr. Gladstone has rendered to the working men of England, probably none will hereafter be more honourably associated with his name than the two measures, one of which constituted the Government the Bankers of the People, and the other which placed within the reach of the provident the advantages of Life Insurance based on the absolute security of the national credit.

We do not propose to speak of the first of those measures now, further than to congratulate those for whose benefit the Savings Bank Act was devised on the splendid success which has been achieved. Since the Act has been in operation, an aggregate sum of £13,000,000 has been lodged at the various Money Order Offices throughout the kingdom. Of that amount, about £6,000,000 have been withdrawn, leaving at the present time on the books of the Postmaster-General, £7,000,000 of money, bearing interest to some 650,000 depositors, each of whom is thus constituted a small capitalist whose ten guineas will represent no unimportant addition to the collective wealth of the nation.

These facts conclusively establish the truth of Mr. Gladstone's belief, that an intelligent artisan or labourer is only improvident when he is uncertain of the safety of such of his hard-won earnings as he might be able to set aside.

Having, as it were, paved the way for the introduction of his second measure, Mr. Gladstone then invited the whole working population of England—a vast majority—to make further provision for themselves and those who were dependent upon them. With earnest eloquence he warned them that the operations of Friendly Societies, although legitimate enough in their proper sphere of providing sick-pay in illness—that is, *if honestly managed*—are not generally conducted on principles which render them safe investments for provision in case of death.

The advantages of life insurance only need to be thoroughly comprehended to make every prudent man determine to participate in them. No other mode of providing for the future can be half so efficacious; for, let a man be ever so frugal in order to put by something regularly in a savings bank, the transaction ends with his death, when all that he has saved, with the interest thereon, represents exactly the sum to which his survivors will be entitled. If he is blessed with long years of life, he will have done well for himself; and if everybody could reckon upon living the full term of threescore and ten, savings banks would answer every purpose. But, inasmuch as a thousand unforeseen contingencies may arise to break the thread of existence, savings bank investments of themselves involve considerable elements of chance. Now, by life insurance this risk is avoided, or rather it is distributed over so large a number of lives that, practically, in an individual it is exchanged for absolute certainty.

Take for example the case of, say a compositor, thirty years of age, who out of his weekly earnings is able to save one shilling a week, which he puts into a savings bank. At the end of ten years his deposits, with interest, will amount to about £30, and, at the end of thirty years, he will have saved altogether something like £100. This is supposing he lives so long; but if he should die sooner—and the probabilities are greatly against him—the sum will, of course, be diminished proportionately. Now, it requires little demonstration to prove that, if by paying his weekly shilling in the shape of a premium for an insurance he could secure the *right* to £100 for his family, let his death happen as soon or as late as it might, there would be clearly a substitution of *certainty* for *chance*.

Of course, to those who may possibly have no object in view in making provision for others after their death, but who may desire to put something by for a rainy day of ill-health, or want of employment, or for temporary investment only, the savings bank is advantageous in every respect; and it is useful, moreover, in connection with life insurance in the way we shall hereafter advert to. The two things are not antagonistic, but are perfectly harmonious in their several operations.

Life insurance enables the man whose earnings will cease on his death to give some of the benefits of those earnings to his family after his

death; and, moreover, it gives to the family of the man who dies early some of the advantages which are enjoyed by the families of those who live for many years.

To the multitudes of strong, active, and intelligent young men—the bone, sinew, and muscle of England—life insurance offers particular attractions, inasmuch as the premium rises with every added year of life. The man who insures his life at twenty years of age, pays about 10s. a year less to secure £100 than is payable by the man who begins to insure in his thirtieth year. The benefits of an early insurance are very great, because, in the first place, as the payments of premium are prospectively distributed over a great many years, the annual payment is thus made smaller during early life, when the cost and care of a family are heaviest; and, secondly, because every man should endeavour to have his life insured whilst his health is good, and before the influence of his occupation, or any other cause, has had time to weaken his constitution, and lessen his chances of acceptance. Many men, who might easily have insured their lives at twenty years of age, have found, at thirty, that they have lost their opportunity.

Every insurance office bases its transactions upon what is called a "Life Table"—that is, a kind of scale showing the rate of mortality and the duration of life at each year of age; and the safety of the office as much depends upon the reliability of its Life Table as that of a ship upon the accuracy of its compass.

Most opportunely for his purpose, Mr. Gladstone was provided with the most perfect instrument wherewith to direct the progress of a life insurance office that had ever been constructed. The English Life Table, based upon the observations of the recorded deaths of 6,470,720 persons, during seventeen years, and of the results of the two census enumerations of the living in 1841 and 1851, was published by the Registrar-General of England in November, 1864; and thus supplied the most accurate estimate of the probabilities of life amongst all classes of the English population that could be obtained.

After due consultation with those who were qualified to advise in such a matter, Mr. Gladstone adopted the English Life Table as the basis of his new adaptation of life insurance to circumstances of a somewhat novel character. With a unanimity which ought not to be forgotten, the Bill for setting the machinery in operation was passed into law, and to the Post Office department, which had so well fulfilled the duties imposed on it by the Savings Bank Act, was confided the charge of the Government Life Insurance business.

Thanks to the administrative talent and ability of Mr. Scudamore, the assistant secretary of the Post Office, the necessary forms requisite for proposals and acceptances, together with lucid explanatory statements of the proposed objects and their mode of accomplishment, and tables of the various rates of premium, were all prepared without delay. The Post Office announced that proposals would be received in April of last year, and forthwith published a list of those Money Order Offices in such towns as were first selected for the receipt of proposals. In the twelve months which have since elapsed the list of Money Order Offices where life insurance may be entered upon has been extended to almost every town in England, and the different postmasters have been supplied with the means of disseminating to the utmost degree information on all points connected with the subject.

Confidence is notoriously a plant of exceeding slowness of growth amongst all classes of our countrymen; and, bearing in mind the difficulty always attendant upon the establishment of any new system of things, it affords strong testimony to the general soundness of the principle which underlies Mr. Gladstone's plan, that there have been nearly 800 policies of insurance issued by the Post Office since April last.

The granting of annuities forms also part of the Government measure, and about 200 of such annuities have already been contracted for.

There is little doubt that as soon as the working classes become thoroughly acquainted with the advantages which are now brought to their very doors, the business of the Post Office Insurance Department will grow with increasing rapidity.

And we are so entirely convinced of the boon which Mr. Gladstone's measure offers to the less wealthy portion of the community generally, that we shall endeavour, in a subsequent article, to particularise some of the many forms in which the thrifty man may avail himself of the opportunity to provide "for his own, and specially for those of his own house."

"The habit of economy once formed,
'Tis easy to attain to prosperous things.
And though a sudden sickness dam the stream,
And cut off thy supplies, thou shalt lie down
And view thy morrows with a tranquil eye;
Even benumbing age shall scare thee not,
But find thee unembarrassed, and secure
From all the penury and wretchedness
That dog the footsteps of improvidence."

Facts and Memoranda.

New Boring Machine. — The important mining district of Low Furness has just had introduced into its works a steam boring machine, that will entirely supersede the old and laborious system of hand boring.

Society of Arts Prizes.—The Society of Arts, not deterred by the apathy of the working classes to its art-workmanship competitions, has determined to increase the temptations to those whom it is intended to benefit, both as affects the arrangement of classes and the apportionment of prizes. Publication of successful works is to be on a greater scale than before, and to include the probability of transmission to Paris on the forthcoming grand occasion.

A beautiful variety of ornamental glass is composed as follows:—Sand, 250 parts; carbonate of soda, 100 parts; carbonate of lime, 50 parts; bichromate of potassa, 40 parts. This glass melts with perceptibly greater difficulty than that without the bichromate; it is of a deep green colour, and full of small spangles, crystals of oxide of chrome, which sparkle with a brilliancy inferior only to the diamond.

The mean of the results of different experimentalists shows that the quantity of carbon evolved by respiration from an adult during twenty-four hours is 5,963 grains, whereas the weight of carbon contained in the food consumed during the same period varies from 3,000 to 4,800 grains. It has been deduced from this fact that carbon is actually formed or secreted by animals. Experiments were tried with a mouse, and the same inference was drawn from the results.

Glass Mould Boards for Ploughs.—A novel idea has been started in America. Some enterprising inventors are making mould boards for ploughs of glass. It is stated that they have been tested on the prairies with practical success. We have glass rollers for mangles in England, and, considering the peculiar characteristics of the material, the only wonder is that it has not been more generally utilised. It is well adapted for many constructive purposes.

Prize for Mechanical Cultivation.—A noteworthy effort is being made in the arrondissement of Compiègne, in France, to induce the application of the highest mechanical skill to the cultivation of the soil. A number of proprietors and farmers have subscribed to offer a grand prize of 100,000f. (£4,000) to the inventor of a system of mechanical cultivation much more economical than those at present in operation.

New Mordant for the Aniline Dyes.—It has been found that a permanent and beautiful colour may be imparted to fabrics of flax or cotton, by means of an aniline dye, if they are previously impregnated with a solution of tannin in alcohol. A most brilliant appearance is given to paper if, before applying the solution of tannin, it has been coated with albumen. As vegetable parchment comports itself with regard to the aniline dyes like silk or wool, it does not require to be treated with the solution of tannin.—*Scientific Review.*

Brush Trade. Bristles.—The demand for bristles is daily increasing, while the supply remains stationary. Any new material which will take the place of them would be a great boon to the trade. It is true that many fibres have been, from time to time, introduced into the trade; but only one is used in any large quantities, and that only for very common work. Nothing has hitherto been discovered which can be made use of as really taking the place of bristles in the manufacture of painting brushes, which require the peculiar soft termination of the bristle (technically called the "flag"), causing the brush to lay on the paint evenly.

Premium for a Water-Meter.—A premium has been offered by the Industrial Society of Amiens, in the following terms:—The proprietors of steam-engines are in want of a water-meter which will indicate exactly the quantity of water injected into the boiler, whatever be the pressure. This apparatus must be one easily set up, not subject to get out of order, and capable of registering the quantity of water to within two per cent. of the actual volume. It is not a description that the society wishes for, but an apparatus in working order, on which experiments can be made; and, if a water-meter be presented appearing to be of practical utility, the society will use every effort in its power to promulgate the use of the contrivance. The meters to be experimented on should be sent to the office of the society before March 1st, 1867.

Things Talked About.

Mr. Peabody has replied with modest dignity to the Queen's letter. The correspondence is historical, and we should do the great American an injustice did we not quote his letter in full:—"Madame,—I feel sensibly my inability to express in adequate terms the gratification with which I have read the letter which your Majesty has done me the high honour of transmitting by the hands of Earl Russell. On the occasion which has attracted your Majesty's attention of setting apart a portion of my property to ameliorate the condition and augment the comforts of the poor of London, I have been actuated by a deep sense of gratitude to God, who has blessed me with prosperity, and of attachment to this great country, where, under your Majesty's benign rule, I have received so much personal kindness, and enjoyed so many years of happiness. Next to the approval of my own conscience, I shall always prize the assurance which your Majesty's letter conveys to me of the approbation of the Queen of England, whose whole life has attested that her exalted station has in no degree diminished her sympathy with the humblest of her subjects. The portrait which your Majesty is graciously pleased to bestow on me I shall value as the most precious heirloom that I can leave in the land of my birth, where, together with the letter which your Majesty has addressed to me, it will ever be regarded as an evidence of the kindly feeling of the Queen of the United Kingdom towards a citizen of the United States. I have the honour to be your Majesty's most obedient servant, George Peabody." A movement is on foot among the merchants of the City to invite Mr. Peabody to a public dinner, before his departure for America.

The "partnership of industry," instituted by Mr. Greening, of Manchester, among his workmen, is extending its field of operation. Co-operative collieries and brickworks at South Buckley, Flintshire, are to be conducted on the same principle. Mr. Greening has issued a circular, in which he gives the following results of some of the industrial partnerships:—"Messrs. John Crossley, Sons, and Co. (Limited), carpet manufacturers, of Halifax, are paying 15 per cent., and their shares, with £10 paid, are selling for £17 each. Messrs. Henry Briggs, Sons, and Co. (Limited), of the Whitwood and Methley Collieries, Yorkshire, have worked six months on the new system, paid an *ad interim* dividend of 10 per cent., and their new shares are being issued at £1 premium. They show an increased production, and other good results. Messrs. Greening and Company (Limited), manufacturers of iron gates, fences, &c., of Manchester, I have already reported upon, and need only add, that shares in that company cannot now be had."

Stimulated, we suppose, by the savings bank clause of the Franchise Bill, and unable to see why any other evidence of provident habits should not establish a similar claim, some of the members of Co-operative societies have originated a movement, having for its object the enfranchisement of holders of £50 capital in Co-operative Societies, which was inaugurated at a meeting of delegates, held at Halifax last week. Twenty-nine societies, having a capital of £400,000, were represented.

Last week we illustrated the manufacture of tin plates. Some interesting statistics on the subject have since been made public. In the last seven years the annual average value of tin plates manufactured in the United Kingdom, and shipped for exportation, amounted to more than 1¼ million sterling. In 1864, which is the latest yearly account completed, the total declared value was £1,263,246, represented by 1,002,947 cwt. of that description of merchandise. Considerably more than a moiety of the total was sent to the United States. France took 49,468 cwt., of the value of £59,411, and Italy 47,305 cwt., representing a value of £59,402. More than 36,000 cwt. were sent to China, and over 17,000 cwt. to Japan. Our own British North American colonies took 36,346 cwt., valued at £49,516. The shipments in 1865 were of the value of £1,482,766, being an increase on those in 1864 of £219,520, the greater portion of such advance being due to renewed demands from the United States.

The members of the Sheffield Filesmiths' Union have decided on submitting the question of the use of machinery in file-making to the arbitration of an equal number of employers and workmen. If we may judge from the temper of some letters which have appeared in the local journals, the filesmiths are beginning to find out that, if the introduction of machinery is too determinately opposed, the result may be that the file trade will altogether desert the town. One writer, who signs himself "A Filesmith," says: "With machinery, Sheffield and Rotherham would be united, and neither forger, grinder, cutter, nor hardener, would be worse off. More shopkeepers would be wanted and consumers benefited, and men would be paid for superintending machines; and it does not matter what dust may be thrown in the eyes of the public, every *experienced, practical* man, who has seen file-forging and grinding in Manchester, *knows* that it is perfectly successful."

The Executive Committee of the Operative Bricklayers' Society have published the result of their operations since the institution of the society eight years since. An increase of wages and an actual reduction of time in

thirty-two English and two Scotch towns are claimed. In those towns the number of resident bricklayers is 2,517; and the whole of these men have received and enjoyed an average advance of 3s. 6d. per week, and a reduction of two hours per week in their working time, for an average of no less than forty-four weeks one day to each town. Another, and a very striking way of putting the matter is, that these 2,517 men have gained in actual money, in forty-four weeks, no less than £19,836 14s. The committee says: "This total will go to benefit the entire trade of the whole of the towns, as a diffusion of capital in the poorer districts is sure to do; adding comforts to homes most needing them, and diffusing general prosperity to the extent of the increased pay of the more necessitous of the toiling population."

The Yorkshire Penny Savings Bank has opened seventeen new branches during the past year, and 192,841 deposits were made in the same period. These are interesting facts.

The Kidderminster weavers differ in opinion from the operative bricklayers respecting strikes. The power-loom and other carpet weavers have held a meeting of their association. The chairman said, and the meeting concurred, that "their object was to have an absolute control over the funds, not to fritter them away in strikes, but to wield them in sending any surplus labour that might arise out of the country. He trusted they were all convinced that any reasonable object could be gained without resorting to strikes; and also that everything might be lost by striking."

Several interesting presentations have lately been made. The valuable services of Mr. James Smith, as secretary to the Manchester and Salford District Provident Society during the prevalence of the cotton famine, has been signally acknowledged by the presentation of a testimonial (consisting of a purse of gold and a silver ink-stand), which took place in the Council Chamber at the Town Hall, Manchester. Other presentations were those of a testimonial by the Northumberland Miners' Association, to Mr. and Mrs. Herdman, of the Stickley Farm, near Shankhouse Pit; also to Mrs. Herdman, of Horton Farm, for their great kindness to the miners of Cramlington during the late strike at that colliery. The gift to Mr. and Mrs. Herdman consisted of an electro-plated coffee and tea service, and that to Mrs. Herdman, Sen., of a silver cup. It was also agreed, by the late workmen of Cramlington Colliery, to present a similar coffee and tea service to Mr. and Mrs. Jamieson, of the "Astley Arms" Inn, Seaton Delaval, for their great liberality and kindness during the many years that the workmen had held their meetings at the "Astley Arms." We record these presentations as pleasing instances of a kindly and friendly spirit.

We have noticed more than once the enterprise of foreign engineers, and how briskly the manufacturers of machinery are competing with English firms. And now we get from Mulhausen, in Prussia, an interesting account of an industrial festival given by the great iron and cotton firm of Kœchlin Brothers, to their multitudinous operatives, *apropos* of the thousandth locomotive launched from the forges of that establishment. A gold cup was presented by the artisans to their employers, and the number "1,000" was emblazoned in every shape around the festive Walhalla.

Mr. Ablett, of Wood Street, who several years since suggested the establishment of a museum of patterns for the encouragement and improvement of Coventry manufactures, is about to make a beginning by taking premises, with the intention of forming a Co-operative company, for the carrying out the idea on a large scale. The proposed museum promises to be of great value to the town.

A little pamphlet, "Local Museum Notes," edited by the Treasurer of the Wimbledon Local Museum, gives some useful instructions, derived from experience, as to the formation of similar societies. Collectors of natural objects are to be found everywhere; and their labours would be facilitated and their pleasure enhanced if they were enabled to write the result of their researches, and communicate their experience to others similarly engaged. The Wimbledon Museum contains the results of researches within a radius of five miles of the parish church, and a similar area is recommended for others; but of course that must depend, in a great measure, upon the character of the locality.

A Manchester scavenger and remover of manure has been sent to prison for a month for assaulting another man, who was willing to work when the majority of the men similarly employed were on strike. Mr. Flowers, the magistrate, threatens a much severer punishment should other cases be brought before him.

Co-operative Intelligence.

Hurst Brook.—The nineteenth quarterly report of the Hurst Brook Industrial Co-operative Society (Limited) shows that the sales during the quarter amounted to £466 6s. 2½d., being an increase of more than £100 over last quarter's receipts, and £78 6s. 9½d. more than any preceding quarter, whilst thirty-two persons had been enrolled as members of the society. At the usual quarterly meeting it was decided to pay a dividend of 1s. 4d. in the pound on members' purchases, and 8d. on non-members'.

Accrington and Church.—The twenty-third quarterly report of the Accrington and Church Industrial Co-operative Society (Limited) shows that the receipts for goods amount to £9,700 12s. 6½d., being upwards of £400 more than the receipts for the previous quarter, and a net profit realised amounting to £873 8s. 0½d., which, after allowing the usual amount for depreciation and educational purposes, enables the committee to declare a dividend of 1s. 11d. in the pound on members' purchases, and remain undivided £4 15s. 4½d. The branch shop in Birch Street is now opened, and is expected to be of great benefit to members.

Dumfermline.—The following is extracted from the nineteenth quarterly report of the Dumfermline Co-operative Society:—"At the beginning of the quarter the number of members was 612, and the amount of paid-up capital £1,750 17s. 5½d. The number of members is now 654, and the amount of paid-up capital £2,051 14s. 5½d., which is an increase of 53 members, and an addition of £300 17s. 5¾d. of capital. £3,689 10s. 4½d. has been drawn for goods during the quarter, which is £117 3s. 10d. more than was drawn last quarter. The amount to divide, after paying or providing for everything required by the rules, and setting aside ten per cent. to the building fund, is £238 3s. 6½d., which gives a dividend of 1s. 4d. per pound to members, and 10¾d. to non-members."

Wigan. Hindley Friendly Co-operative Society (Limited).—The thirty-second quarterly report of this association shows that during the past quarter the sales amounted to £2,582 0s. 2d.; the deposits, to £480 17s. 3d.; and the amount withdrawn, including interest and dividend, to £206 10s. 2½d., thus leaving the net amount to credit of members £5,574 2s. 5½d. The profits disposable amounted to £222 4s. 3½d., the dividend to members being 1s. 4d. in the pound, and to non-members 10d. in the pound. Forty-nine members have joined during the quarter, and eight have withdrawn, thus leaving an increase of forty-one upon the previous quarter. The New Springs Branch Store has fairly commenced business, and the sales up to the close of the quarter amount to £222 13s. 9d.

Rochdale. The Equitable Pioneers' Society (Limited).—The eighty-fifth quarterly report shows continued progress on the part of the society. The total amount of cash received for goods sold during the quarter is £57,317 4s. 11d., being an increase of £12,266 11s. 6½d. when compared with the corresponding quarter last year. The profit to divide is £7,734 14s. 10d., which, after allowing £255 14s. 2½d. for depreciation of fixed stock, and £163 14s. 7d. for educational fund, will allow a dividend of 2s. 6d. in the pound to members. During the quarter the new branch store at Buersill has been opened nine weeks, and the total cash received is £2,373 1s. 1d., being an average over £263 per week.

Upper Mill, Manchester.—The twenty-second quarterly meeting of the Upper Mill Industrial Co-operative Society (Limited) was held in the upper room of the store on Tuesday evening, the 3rd inst., John Challoner in the chair. The report stated that the building and fixed stock capital was £1,022 15s. 1d.; number of members, 189; members' claims, £983; receipts from sales, £1,133 2s. 10d.; profits, £131 10s. 7½d., which allowed a dividend to members of 2s. 2d. in the pound, leaving a surplus of £12 6s. 11½d. for depreciation fund.

General Information.

CLUBS AND INSTITUTES.

St. Andrew's Working Men's Association, Plymouth.—From the fifth annual report of this association, we learn that the number of members at present in the association is very satisfactory, and the tone of the association generally is such as to lead the committee to indulge in anticipations of even greater success in the coming year than has yet attended it since its formation. The average monthly attendance during the past year was about sixty-three, and the number of men who, during that time, have taken a share in the benefits of the association, was over 250. The number at present on the register is 100, and this number is steadily increasing. The committee perceive, with peculiar pleasure, that the class of men who are now forming the association are of maturer years and larger experience than that of some former sessions.

Southwark Working Men's Club and Institute.—With respect to the admission of youths as "associates," the honorary secretary of this institution writes:—"We take them at eighteen; but they have first to obtain the signature of two members. If such members continue to support them, they remain until twenty-one, when they take the full privilege of the club. It is understood they are admitted, on sufferance, to attend general meetings, but cannot vote, but may speak, by consent of the chairman. They sit away from members by themselves."

Hanley.—At a recent tea-meeting here for promoting the interests of the Working Men's Reading-room, the chairman read over the list of the newspapers and periodicals taken, observing that the members also had the advantages of the library, which contained 4,200 volumes, and reminding them that the room was their own, and that all they had to pay was one penny a week. The room had been provided entirely for the working men, and there was no town in the Potteries in so good a position in that respect.

The West London Working Men's Club Company has just been established for purchasing the lease of the premises, No. 73, Great Titchfield Street, and the hall at the rear, together with the furniture and fixtures belong to the All Souls' (St. Marylebone) Working Men's Club and Institute, and for letting on hire the same hall and premises, together with the furniture and fixtures therein, for gain; and also for promoting the objects of the All Souls' (St. Marylebone) Working Men's Club and Institute. The premises proposed to be purchased are well adapted for a working men's club, there being ample room and accommodation; and there is no doubt that, by judicious management, the club would be highly successful, as proved by the fact, that during the time it has been opened—about two years—upwards of 2,000 working men have been enrolled as members. Certain privileges will be conceded by the All Souls' Club to shareholders, and priority will be given to applications for shares from members of the club, and from working men generally. Nearly 200 shares have already been applied for by members of the All Souls' Club.

Westminster Working Men's Club.—On Friday, the 13th inst., the members of this club took possession of their newly-erected premises in Old Pye Street, the Duck Lane building having been required for the Westminster improvements. The new building consists of a club and lecture-rooms, and of a model dwelling-house. The reading-room is provided nightly with six copies of the evening papers, in addition to seven weekly papers, twelve monthly magazines, and a library of 500 volumes. There are educational and other classes three times a week, fortnightly lectures, &c. There are also four benefit societies in connection with the institution. The club affairs are managed by a committee and secretary chosen from the members themselves, Miss Adeline Cooper merely acting as treasurer. The subscription is one halfpenny per week.

Volunteer Club at Redditch.—On the 3rd and 4th inst. two conversazioni were held at the National School-rooms at Redditch, for the purpose of aiding the funds of the Club and Reading-room established by the volunteer rifle corps of that locality. During the whole of Wednesday there was an exhibition of valuable works of art and specimens of natural history, generously lent by the inhabitants of the neighbourhood. On the evenings of both days crowded audiences were instructed and entertained by the delivery of addresses, excellent music by amateurs, and scientific experiments of the highest interest. The inaugural address was delivered by the Rev. H. Solly, of the London Working Men's Club and Institute Union, the chair being filled by Victor Milward, Esq. We understand that the volunteers are desirous of extending the advantages of this valuable institution to the working classes of the neighbourhood generally, and we hope soon to learn that this desirable object has been carried out.

STRIKES AND WAGES.

Effect of Irish Emigration on Wages.—The rapid increase of emigration from the southern counties of Ireland is producing a result at which the labouring population cannot complain. The wages for farm labourers during the past ten days attained the highest figure ever known in Kerry—12s. to 15s. a week with board. In many parts of the county of Cork the rate is 10s., and as emigration continues as brisk as ever, labour is likely to command this price very generally during the ensuing month. For twenty years there has not been such an emigration from the port of Drogheda as at present.

Strikes for advanced wages or reduction of hours of labour, or both combined, have taken place among the carpenters and joiners of Inverness, Leek, Rugby, Grimsby, Darlington, and other places; also among the bricklayers of Middlesbro', the Huddersfield plasterers, and the colliers at Tenby Grange, Thorncliffe, and other pits.

The strike amongst the millmen at Consett, at Messrs. Bolckow, Vaughan, and Co., Middlesboro', and Messrs. W. Whitwell and Co., South Stackton, which has now continued for several weeks, has not yet been brought to a close. The same may be said of the strike of puddlers at Elscar Ironworks.

An increase of wages has been obtained by the joiners of Bishop Auckland, the London deal furniture makers, the furnace-men at Cargo Fleet, and the bricklayers and labourers of Burton.

Movements in favour of an increase of wages have been commenced by the iron ship-building trades on the Tees, the painters of Newcastle, the London carpenters and joiners, and the Birmingham tailors.

INDUSTRIAL EXHIBITIONS.

Devon and Cornwall Working Classes' Industrial Exhibition.—The recently published report of this exhibition states that the proceeds have enabled the committee to pay all demands on their funds, give a large amount of money in prizes, and divide a small balance among the Plymouth and Devonport hospitals,

and the working men's associations at St. Andrews, Shaftesbury, and Devonport.

City of London Working Classes' Industrial Exhibition.—Upwards of 1,500 articles have been adjudicated upon. Of these 510 were sent in by amateurs, 883 by workmen engaged in various trades, 69 by employers who conformed to the rule 3, which required that the names of the actual workmen should be affixed to the articles, and 32 by employers who did not conform to this rule, and by persons who had lent articles on loan, both of which are ineligible for prizes. The total number of exhibitors is 827. Among these 95 medals (of bronze) have been awarded, and 94 certificates of honourable mention.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

INVENTIVENESS OF WORKING MEN.

To the Editor of the Working Man.

Sir,—Your correspondent, "Overlooker," is quite correct in his idea as to the want of invention amongst working men, and has made a valuable suggestion as to the means of improving them in that respect—viz., by using your valuable Journal as a medium for suggestions of articles of utility required. However, in reference to his idea of a "crust-grinder," he has made a mistake. There ought not to be any crusts—I never saw any of the kind mentioned in our house all my life. I am a working man, and have a large family, and find by experience that "prevention is better than cure" in every instance, and that, in our house, a crust can never be found left in the bread-basket after a meal; nor do our children ever go away from the table with a crust in their hands.

The cost of the various domestic machines of the kind suggested precludes their use in the families of working men, as I have noticed frequently. A very profitable one is the sausage-machine; but I do not think one working man in a thousand has found it convenient to buy one, although the invention has long been in existence.

I, however, admire the suggestion of "Overlooker," and would like him, or any one else, to satisfactorily settle one point—viz., the way to get an adequate reward for any invention.

I should like every inventor to profit by his invention; but he cannot do so in the present state of the laws.

If he exhibits without first protecting, he loses it for ever, unless he is a manufacturer, or circumstances have placed him in a position to sell the article to the trade without incurring the expense and difficulties attendant upon its introduction. If a working man, it is almost certain he will not be able to patent it; and if he can, he then requires capital to introduce it, and even protect himself against piratical manufacturers, who, I regret to say, are very numerous.

A silver, nay, even a gold medal, alone, would not repay a man for producing an article of universal utility. The merit would be the inventor's, but the profit would be the manufacturer's, who would make it a sort of monopoly.

To ask a manufacturer to buy it as a model or an idea would be useless, for two reasons—one is, that he can make it without; and the other, that he would give so little for it in proportion to its utility or value.

This point settled, I would with pleasure suggest several useful articles and improvements wanted, and would assist in promoting the object in every way I could. I feel an interest in this subject, and will, if agreeable, write again.—I am, Sir, yours truly, Rowland Thomas.

A NEW RULE FOR INDUSTRIAL EXHIBITIONS.

To the Editor of the Working Man.

Sir,—It was impossible not to feel gratified at the communication from Mr. W. J. Watts, the Secretary of the Metropolitan and Provincial Working Classes' Industrial Exhibition, which appeared in your thirteenth number, stating that a prize medal for the best working model of an inexpensive crust-grinder, suggested by me in a previous number, would be given by that Exhibition. In thus encouraging inventiveness and originality of design and workmanship, these exhibitions will acquire new uses and a higher character than they have hitherto attained.

I am very glad to observe that the Society of Arts have introduced into their programme of prizes for art workmanship a clause, which deserves the notice of the conductors of the Working Class Exhibition. They propose to permit "any producer to exhibit, in connection with their society, either in his own name or through his workmen, any work or works, as specimens of good workmanship, provided that the work or works be accompanied with a statement of the name or names of the artisans who have executed their respective portions; and if the work or works be sufficiently meritorious to deserve them, extra prizes will be given to the artisans who have executed them." This arrangement is a very wise one, and working men may be grateful to the Society of Arts for having devised it. At present, Working Men's Exhibitions cannot be made attractive wholly by their own workmanship. They have not capital nor ideas sufficient at present to fill a great exhibition with their exclusive handiwork. The committees, therefore, are obliged to have recourse to masters and shopkeepers, to lend them attractive objects. Objections have been made to the present exhibition in the Guildhall, London, that it is more a shopkeeper's and manufacturer's exhibition than one of workmen. But this rule of the Society of Arts will, if acted upon, make it possible to combine the capital of the master and the skill of the artisan in the same exhibition. The skill of the workman and the design of the employer will both have recognition and awards. This seems to me, Mr. Editor, a step so necessary and important, that I shall be obliged by your permitting me to draw the attention of your readers to it, who may be connected with devising and conducting Working Men's Exhibitions.—I am, Sir, yours respectfully, An Overlooker.

PRIZE ESSAYS BY WORKING MEN.

To the Editor of the Working Man.

Sir,—I see that prizes are offered, through the medium of your publication, for Essays on various subjects by working men. Allow me to suggest that there is, perhaps, not a more important question for that class of people to solve than that of the "Working Woman at Home"—whether it is better for the wife and mother to be employed in her family, or in occupations which take her from her home? I do hope this subject may be added to the list which I see published in Nos. 10 and 11 of the Working Man.—I am, Sir, yours truly, M. A. B.

THE "WORKING MAN" LIFEBOAT.

To the Editor of the Working Man.

Sir,—Having noticed the valuable suggestion of Mr. Watts in your Working Man, that working men should raise a subscription for the purpose of presenting to the National Lifeboat Institution a lifeboat, to be called the "Working Man," I think many working men would approve of Mr. Watts's suggestion being carried into practice, and heartily give their mite to assist in saving human lives from a watery grave. And I should think no better plan could be adopted for collecting contributions than that used for the *Quiver* Lifeboat Fund.—I am, Sir, yours truly, A Working Miller.

To the Editor of the Working Man.

Sir,—I am very happy to see that the suggestion thrown out in your columns a few weeks since is likely to be carried out, and to good effect. I refer to the Lifeboat, and to the letter of my friend Mr. Watts in your last issue. The suggestion he makes is valuable, and I believe only wants to be made in a practical form to meet with great success. A lifeboat would, indeed, be a most interesting feature of the forthcoming Industrial Exhibition to be held in the Agricultural Hall, presented to the nation by the working men, and called by their name, and I feel bound to say that no more honourable name could be given to it. The National Lifeboat Institution is a blessing to our favoured country, and has done, and is still willing to do, a vast amount of good; but its power is necessarily limited in extent, and I feel certain that the working classes would aid with the greatest pleasure the objects of such a noble institution, which has for its aim one of the greatest and most important of duties, the saving of human life from the power of the elements. The experience of the last few months has taught us that many more lifeboats are required, and the sooner every dangerous point of our coast is supplied, the happier and more contented shall we feel.

Remembering the fearful violence of the late storms, which raged with such power on this coast, and the great number of lives which were lost but a few weeks since all around this neighbourhood, I should feel a peculiar pleasure in being allowed to assist in such a noble work. There are many perilous parts of the coast of Devon and Cornwall where a lifeboat would often be of great service, and where there is no lack of hardy, bold, and noble men, who would gladly put to sea in the fiercest gale to endeavour to rescue their drowning brothers, were they provided with a safe and sure means of rescue.

I am very pleased to see that the celebrated firm which you represent are willing to take this matter in hand, and trust that I shall have the pleasure of seeing the "Working Man" in reality, if I am privileged to visit the Agricultural Hall in the ensuing autumn. There is no difficulty in the matter. Many schemes may be brought forward, and may be met by numerous obstacles, but I feel sure that none exist in this case. I shall only be too happy to use my best endeavours for the good of the cause in this locality, and believe that the suggestion will call forth a response from the heart of every right-thinking working man.

I would suggest that a circular be printed and circulated, and that each subscriber to the Working Man—I mean the Journal—be solicited to give his support to the scheme and become collector. I have no doubt Mr. Watts would assist greatly in the matter. The influence he has in various parts of the country, as connected with the Industrial Exhibition, will, I am sure, go far towards ensuring the success of the undertaking. I would, therefore, further suggest (of course, subject to your own decision), that Mr. Watts be requested to ask his agents in various parts of the country to become also agents for this matter; that collecting cards or papers be prepared at once and circulated, your own firm, as stated, to be the treasurers, to whom all remittances should be sent. A well-organised plan would, I am sure, be the means of adding, not only one, but several lifeboats, to the number at present doing such noble duty.

Trusting that you may find a corner for these few remarks, and, further, hoping that by next winter the lifeboat may be at its post, but, happily, not required, I remain, Sir, yours very truly,

Plymouth, April 5th, 1866. W. H. K. Wright.

To the Editor of the Working Man.

Sir,—I have seen with great pleasure that you have given Mr. Watts's letter a prominent place in your columns, of which, as an effort in the cause of humanity, nothing could be more deserving. I am sure my fellow working men will not be deaf to an appeal in such a noble cause, but will come forward willingly and assist.

I beg to propose that you issue printed forms with the Working Man, to be filled up with subscriptions and returned with the amount collected; and I also suggest that our clubs take a part in the movement, for if they do so to the extent that I imagine they are capable of, we shall be able to have two lifeboats, instead of one. One might be named the "Working Man," and the other, in memory of one of his best friends, "John Cassell."

Pledging myself to do the most that small means will permit, I remain, yours truly, D. H.

April 9th, 1866.

BREAKFAST TIME.

To the Editor of the Working Man.

Sir,—I have long thought it would be a step in the right direction for Trades' Unionists and agitators for the moral and physical welfare of the working classes, if, in connection with the shortening of the hours of labour, they would give their attention to what seems to me a way whereby they would gain a step, at least, toward their end—namely, instead of a half-hour for breakfast, as is the custom in all large towns in England, this was changed to one hour, as is the custom everywhere in Scotland, where it works with beneficial effect—especially in the case of the building trades in Edinburgh, where, principally through having the hour for breakfast, they only work fifty-one hours per week. By that means, they would not only shorten the working day, but would also be enabled to go home to a comfortable and cheaper breakfast.

Trusting you will oblige by inserting this in your truly valuable paper, I am, Sir, yours respectfully,

A Working Man.

Newcastle-on-Tyne, April 3rd, 1866.

THE PERMISSIVE BILL.

To the Editor of the Working Man.

Sir,—Two important subjects—Temperance and Co-operation—to which you have given prominence in the Working Man, have caused me to feel an especial interest in this unique publication. May I claim a few lines amidst your voluminous and interesting correspondence for a notice of one branch of the temperance question which has not received adequate attention; I refer to the movement for obtaining permissive prohibition of the liquor traffic. I fear that thousands of temperate and well-meaning working men in the metropolis are prejudiced against the proposed Permissive Bill, promoted by the United Kingdom Alliance. What does that Bill propose? Here is the preamble:—"Whereas the common sale of intoxicating liquors is the fruitful source of crime, immorality, pauperism, disease, insanity, and premature death; whereby not only the individuals who give way to drinking habits are plunged into misery, but grievous wrong is done to the persons and property of Her Majesty's subjects at large, and the public rates and taxes are greatly augmented; and whereas it is right and expedient to confer upon the ratepayers of cities, boroughs, parishes, and townships, the power to prohibit such common sale as aforesaid: be it therefore enacted," &c. A clause provides that when two-thirds of the ratepayers of any parish object to the sale of intoxicating drink, they shall have power to veto the issuing of licences. This is fair, I think, and I am sure the matter at issue is of vital importance to working men and their families. I content myself with simply introducing the subject of the Permissive Bill. I hope, sir, you will permit the measure to be discussed. Let both sides have a fair hearing.—Yours truly,

Manchester. Henry Pitman.

TO CORRESPONDENTS.

A Subscriber (Thurso).—We know of nothing better than soap and water. If the dye be good, the flannel will not fade; but some portion of colour generally washes out. To restore it, a dip into a red aniline dye will be found effectual. Handwriting pretty good.

Hopeful.—The punches you require for modelling flowers are sold at the tool shops of London and other large cities; the prices vary with the size, &c.

Searcher.—Sealing-wax is made by melting slowly over a gentle, clear fire 4 lb. of shellac, and, when melted, adding 3 lb. of vermillion if for *superfine* wax, or red lead or Venetian red for bottle wax, and 1 lb. of turpentine, first removing the pot from the fire. When the whole is well stirred and mixed thoroughly, weigh out portions of half a pound each, and roll them on a marble slab, kept warm by a stove beneath. They are then removed to a cold marble slab, and rounded and polished by being rolled under a smooth block of wood furnished with handles. The polish is increased by holding the sticks of wax before a clear fire for a few moments. Black wax is obtained by substituting lamp-black for vermillion. Making fulminating silver is a very dangerous operation, which you do well to avoid.

Ainslie.—Fustic is not a permanent dye, and is never applied to a stuff alone. It is employed in conjunction with permanent dyes to produce various hues of orange, scarlet, chamois, and various orange greys.

Y. C. W.—Canada is preferable to the United States for emigrating to: the cost of living in the latter is a serious difficulty for a person to encounter while seeking employment.

Alfred C.—Your chisels break because they are too hard. Let the temper down slightly, and you will succeed better.

W. A. S.—No feed-pump is required when Gifford's injector is employed.

Vulcan.—See the article in the previous number, entitled, "The Art of Writing Prize Essays."

H. B.—Thanks for the extracts, but they are scarcely suitable for our columns.

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength. Sold by Chemists, Confectioners, &c., in most Towns. [18

By Royal Command, Metallic PEN MAKER TO THE QUEEN. JOSEPH GILLOTT Respectfully directs the attention of the Commercial Public, and of all who use STEEL PENS, to the incomparable excellence of his productions, which for Quality of Material, Easy Action, and Great Durability, will ensure universal preference. The Original Chlorodyne, Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c. EARL RUSSELL communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chloro-DYNE.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chloro-DYNE engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ¼ oz., 1s. 1½d.; 1½ oz., 2s. 9d.; 10 oz., 11s.; 20 oz., 20s. Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [16

Hall's "Lung Restorer" gives instant relief in Coughs, Asthma, Hoarseness, Sore Throat, &c. Mr. E. Brooke, Mirfield, near Leeds, writes, after suffering over ten years with an asthmatic cough, "Three 1s. 1½d. bottles cured me." Prepared by THOMAS HALL, Chemist, 6, Commercial Street (City side Great Eastern Terminus), London, and sold by all Chemists, in bottles, at 1s. 1½d., 2s. 9d., &c. [17

The Planet Permanent Building and Investment Society, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary

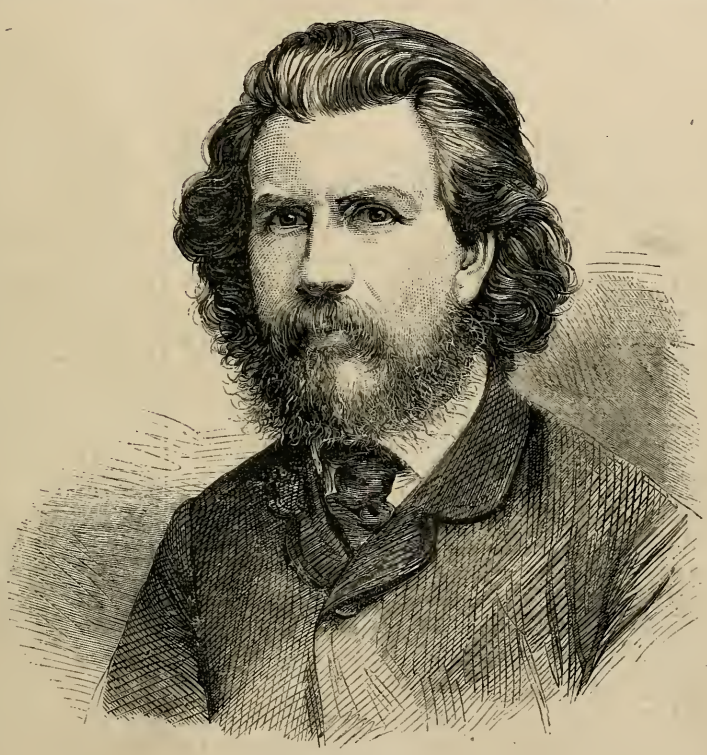
Gerald Massey.

THE ranks of Labour have produced many noble-hearted singers, men of stern purpose and heroic nature, in whose ringing, impassioned outbursts of song, the most superficial of observers can scarcely fail to detect something of the history of the poet: of his slow and painful march from darkness into light, and of his fierce struggle—hand to hand and face to face—with the gloomy cares, agonising trials, and bitter sorrow, which so frequently beset the pathway of those born to a life of poverty and toil. Such men seldom forget the order from which they have sprung. Their greatest glory is to become the chosen interpreters of the people; to chant the glorious aspirations of the children of toil, and to become the welcome messengers of the happy days yet in store for those whose lot is generally one of pain and hardship.

So it was with Gerald Massey, who, to use the words of a critic in the *Times*, has fought his way to the temple-gate sword in hand. When he had emancipated himself from the burdens which had pressed so heavily upon his earlier life, and gained for himself a reputation envied by many, he said, with simple, yet touching pathos—"I retain my verses as memorials of my past, as one might keep some worn-out garment, because he has passed through the furnace in it; nothing doubting that, in the future, they will often prove my passports to the hearts and homes of thousands of the poor. . . . They will know that I have suffered their sufferings, wept their tears, thought their thoughts, and felt their feelings, and they will trust me."

None but one who had experienced the saddest trials of a toiler's life could have spoken thus, and Gerald Massey was no exception to the rule. Born in 1828, the son of a canal boatman, residing at Tring, Gerald Massey, while yet a boy, had to learn to work for his living. At an age when other children were at school, or gathering buttercups in the fields, young Massey was toiling in a silk mill. He was only eight years old, yet he had to rise at five in the morning and work until half-past six in the evening. No matter whether it was summer's heat or winter's cold, sunshine or rain, the poor child had to be at his post; and woe to him if he was belated—if he was not within the gate by the time that the factory bell had ceased ringing! A fine, however little, had a sensible effect upon the 9d., 1s., or 1s. 3d., which formed the respective amounts received by the child for his labour. Can we wonder that, in after years, the thoughts of his child-life should have nerved his muse into some of those bold, fiery utterances, which sank so deeply into the hearts of those who heard them? At last, the mill was burnt down, and young Massey stood for twelve hours in the cold wind and sleet, rejoicing at the destruction of what, to him, had seemed little better than a prison.



GERALD MASSEY.
(From a Photograph by J. and C. Watkins, Parliament Street.)

After this, he went to straw-plaiting. The Reports of the Childrens' Employment Commissioners have told us a few of the evils of child-labour in this trade, but Gerald Massey tells us more. The nature of the work, and the unhealthy character of the district in which it was followed, led to the workers in young Massey's neighbourhood constantly having severe attacks of ague. For three years, the future poet suffered from this complaint, which ended at last in tertian ague. Sometimes four of the family and the mother lay ill at one time, all crying with thirst, with no one to give them drink, and each too ill to help the other. Is it surprising that, when the iron had sunk thus deeply into the poet's nature, his first utterances should issue in the shape of fierce, passionate denunciations of the various disparities of our social life? But, Chartist and Republican as the boy afterwards became, there was something in him which led him to gaze above the jarring creeds of political life, and to sing of the eternal brotherhood of man.

Poor as his mother was, she had a kind and good heart. The cares of the harshest poverty had failed to deaden her maternal instincts, and—as in the case of many others who have gained for themselves a reputation—it was to his mother that Gerald Massey owed much of all that was great and noble in him. She sent him, whenever possible, to the penny school, where he learned to read, and where the desire to read became awakened. The Bible and Bunyan's "Pilgrim's Progress" were the principal books to which the boy had access. Afterwards, "Robinson Crusoe" was added to the list. Henceforth the life of Gerald Massey was divided between his work and his attempts to gratify the intellectual yearnings which had been awakened within him. Then came the moment when the first inspiration of the poet flashed within his mind. He had become an errand-boy, and while acting as such in 1848, the news of the French Revolution came to the town in which he worked. The effect upon the mind of Massey was electrical. To use his own words, it was scarred and blood-burnt into the very core of his being. He could no longer restrain himself. He must either sing or die. He must breathe aloud to the world what he believed to be the wrongs of his order, and denounce, in burning language, the acts of those whom he regarded as wrong-doers. Led away by the enthusiasm of his nature, he started, in April, 1849, a small, coarsely-printed periodical, entitled the *Spirit of Freedom*. The extreme opinions advocated by it prevented it from attaining a considerable circulation, and even cost Gerald Massey three situations in eleven months; but there were not wanting those who detected in the wild and almost extravagant utterances of Massey the signs of a genius that was capable of better things. Nor were they mistaken. In the *Christian Socialist*, and afterwards in the *Leader*, there appeared from his pen several poems of exquisite beauty, and strangely at variance with the almost savage wildness of his political lyrics. Gerald Massey was indeed a poet.

Friends now gathered around him, and he was encouraged to prepare a small volume of verse for the press. It consisted chiefly of his earlier pieces, and was published by the late Mr. Bogue. Its success was immediate and decided, and before many weeks had elapsed the whole country was ringing with the fame of its new poet,

the humble man who had so energetically fought his upward way from the ranks of toil to the gate of the golden temple. Preserved by his intense love of the Beautiful, his soul-worship of Nature, from the effects of those degrading influences which have so often proved the bane of our workmen-poets, Gerald Massey has lived to free himself from the erroneous impressions which led him, in some of his earlier pieces, to sing of the rich as if they were the natural enemies of the poor. He has learnt that amid all the faults and vices of modern society, the glorious work of bridging over the broad chasm which separates the two great divisions of the community is being steadily proceeded with. As Massey himself says:—

> "There's no dearth of kindness
> In this world of ours;
> Only, in our blindness,
> We gather thorns for flowers."

And so, with the fresh light afforded him, Gerald Massey has steadily worked on in the course which he has chosen, striving with the voice of poetry to cheer the hearts of his fellow-workers, and to soothe the sufferings of those over whose fortunes Poverty has cast her disheartening spell.

As a writer for the press, he has found a congenial sphere for the exercise of his abilities, and the bestowal of a pension by the late Lord Palmerston has to some extent rendered him less dependent upon his pen for a livelihood; but recently a dark shadow has fallen over his hearth. The gentle wife, whose smile of encouragement in the moments of despondency inspired him to renewed exertions, and who had shared with him the long and weary struggle of his life, has been taken from him. It is a terrible affliction; but the "Poet of the Poor" has one consolation: his sorrow is shared by many of those whose cause he has advocated, and whose aspirations he has so boldly and so powerfully interpreted.

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

We owe our knowledge of the laws of friction to the experiments of Ximenes and Coulomb, made with an instrument similar to that described in our previous article, and which was called by them a *Tribometer*, or Friction-measurer. The following laws of friction on a horizontal surface were fully established by these distinguished observers:—

1.—*The friction is proportional to the weight.*
2.—*The friction varies with the substances in contact.*
3.—*The friction depends but little (if at all) upon the area of the surfaces in contact.*

These laws of friction were published by Coulomb, in 1781, in the French Academy of Sciences. The celebrated philosopher, Amontons, had previously published in the Academy some experiments on friction, in 1699, by which he showed that friction was independent of the surfaces in contact; but, with this exception, it was reserved for Coulomb to make known the laws of friction. Further experiments were made at Metz by Col. Morin, in 1831—34, by direction of the French military authorities, the result of which was to confirm, with trifling exceptions, all the previous results of Coulomb, and to determine, with considerable precision, the numerical values of the co-efficients of friction for all the substances usually employed in the construction of machines.

When a man or quadruped is required to travel along a horizontal road, the force that he has to overcome is that of friction, including the resistance of the air. His forward motion is produced by the propulsion of his legs, which may be regarded as bent levers capable of extension and flexion by the action of suitable muscles. When each foot is placed upon the ground, the different joints are bent, and, as the step forward is made, the muscles extend each joint, and so propel the body forward, in the same manner as a boat or wagon might be propelled by persons placed within, pushing, by means of poles, against the solid ground. The details of progressive locomotion are very complicated; but, fortunately, the results are easily computed in *Work done*, which, as I have already shown, constitutes the basis on which mechanical philosophy must be permanently established.

I have already proved that the work done in an average day by the muscles of the human body is equivalent to lifting 350 tons through one foot. Let us compare with this amount of work, that which is done in walking unloaded, or carrying weights along a level road.

1. If a pedestrian be employed in walking only, without load, it is found that twenty miles a day, with rest on Sundays, give full employment to his strength, and that this amount cannot be exceeded with prudence. From this assumption, if we suppose the man's weight, including clothes, to be 160 lb., we find—

$$\text{The work done in horizontal transport} = \frac{160 \times 20 \times 5280}{2240} = 7543 \text{ ft.-tons.}$$

2. Coulomb observed the work done by porters employed to carry goods 2,000 mètres, returning unloaded, and found that each carried, in the course of the day, 348 kilos. in six journeys, loaded with 58 kilos. at a time. If we suppose each porter to weigh 70 kilos., we shall easily obtain the following result for the horizontal transport:—

Useful work	$= 2{,}000 \times 348$	$= 696{,}000$ kil.-mètres.
Work wasted	$= 2{,}000 \times 2 \times 70 \times 6 = 1{,}680{,}000$	,,
	Total,	2,376,000 kil.-mètres.

Dividing this result by 311, in order to reduce it to foot-tons, we find—

$$\text{Work done by porters in horizontal transport,} \frac{2{,}376{,}000}{311} = 7{,}640 \text{ ft.-tons.}$$

3. On questioning a number of pedlars, who travelled always loaded with their packs, Coulomb found that they were able, with a load of 44 kilos., to travel 19,000 mètres per day.

Assuming their weight at 70 kilos., as before, we find—

Useful work of pedlars,	$19{,}000 \times 44 =$	836,000 kil.-mèt.
Work wasted.	$19{,}000 \times 70 = 1{,}330{,}000$	,,
	Total,	2,166,000 kil.-mèt.

Converting this, as before, into foot-tons, we find—

$$\text{Work done by pedlars in horizontal transport} \frac{2{,}166{,}000}{311} = 6{,}964 \text{ ft.-tons.}$$

Collecting together the preceding estimates of human labour employed in the horizontal transport of weights, we find—

1. Man unloaded . . .	7,543 ft.-tons.
2. Porters loaded and unloaded .	7,640 ,,
3. Pedlars loaded . . .	6,964 ,,
Mean . . .	7,382 ft.-tons.

By dividing this number, which represents the weight transported horizontally in a day by the labour of one man, by the number of tons which a man can lift vertically in a day, we obtain the proportion of weight to friction, or, as it is generally called, the coefficient of friction.

$$\text{Coefficient of friction} = \frac{7{,}382}{350} = 21{\cdot}1.$$

If, instead of 350 ft.-tons, we take the mean of all the results given in the table on page 178, we find—

$$\text{Coefficient of friction} = \frac{7{,}382}{279} = 26{\cdot}4.$$

The coefficient thus obtained coincides in a remarkable manner with that found from a careful study of the mechanism of walking. In walking, the leg which rests upon the ground supports the centre of gravity, which is first raised by the thrust of the other leg against the ground, and afterwards falls, while the suspended leg swings forward as a pendulum, and becomes in its turn the support of the centre of gravity, which is made to ascend and descend, as before, by the thrust and subsequent fall of the other leg. The forward movement of the body, or its horizontal transport, is effected by the pendulum-like movement of the leg, caused by the raising of the centre of gravity, and the work done in walking one step is simply the weight of the man multiplied by the height to which his body is raised at the commencement of the step.

It has been found, by an apparatus invented for the purpose by M. Weber, that in ordinary walking, when the length of the step taken was 2·39 feet, the mean elevation and depression of the centre of gravity was 1·1 inch; and this proportion of elevation of centre of gravity to length of step remained the same, whatever rate the walking was effected at.

From this experiment we find—

$$\frac{\text{Vertical elevation}}{\text{Horizontal transport}} = \frac{110}{239 \times 12} = \frac{1}{26}$$

From all the preceding considerations, it follows that we are entitled to convert horizontal work done in the transport of burdens by man into work done by lifting weights, in the proportion of from twenty-six to twenty-one to unity.

Similar considerations entitle us to apply the same rule to the work done by other animals.

* Continued from page 246.

*Window Plants and their Culture.**

The appearance of insects on plants frequently results from bad treatment; the plant gets weak and unhealthy from want of room and air, and as soon as from these and other causes it becomes fitted for these little pests, they come in thousands. The best way is to remove the plant to some separate place, so as to prevent the insects spreading to the other pots, and by fumigating them with tobacco smoke, they will be stupefied (not killed), and can be washed off. There is a powder which is very useful in removing the green fly; it is sold in little gutta-percha balls, under the name of "Dumont's Insect Powder." When dusted on the spots affected, it kills the little insects.

In growing cuttings it is very easy to apply a little heat, which will greatly help the young plants in forming roots. If a common tea-chest has a plate of glass fitted to the top for a cover, the pots when placed in it can be heated by putting among them a jar, renewed morning and evening with fresh hot water, until the slips have taken root. In a little book written by Miss Maling, full of useful hints to those who love flowers—"Indoor Plants, and How to Grow Them"—there is a description of a useful contrivance for growing slips, and forcing bulbs and plants. It consists of an adaptation of a drawer, or false bottom, to the usual Wardian case, which is so well known: this drawer is filled morning and evening with hot water, so that in the interior of the case a constant hot-house heat is most easily kept up, and the most delicate plants can be successfully grown.

The common Wardian case is very well adapted to growing rare and beautiful ferns, and I have seen in an old "Florists' Magazine," a list of gloxinias and other hot-house plants which are suitable for culture in one; but nothing looks prettier than such a collection of ferns and mosses as can be grown in a Wardian case, with only a northern aspect, and even in the confined and unwholesome air of the city. It consists of a box of wood, about nine inches in depth, and three feet long by two feet or one foot and a half broad; in this is placed the earth in which the plants are to grow, or the plants are placed in pots and sunk in sand. This box has then a covering of glass from a foot and a half to two feet high, and, when the plants get a good watering, and this case is fitted over them, they keep the air pure, and the moisture which rises by day from the damp earth or sand, and falls by night, makes them flourish, and grow green and beautiful.

By keeping the pots in which window plants are grown sunk in sand or in a second pot, five or six inches will be a suitable size to have them. Plants flower sooner in small pots, and there is room for a larger number. It is a good plan to keep constantly growing young plants, for, in most cases, they produce the largest flowers, and they make nicer looking plants; of course, there are exceptions to this as to every other rule which I have laid down, and what these exceptions are experience will quickly show.

One of the most interesting branches of gardening is the raising of new plants from seed; and, though "window gardening" implies want of space to carry on experiments on a large scale, yet the beauty of the window will depend greatly on the annuals that can only be grown from seed.

Such plants as nemophila insignis (bright blue), mignonette, asters, schizanthus, and German ten-week stocks, can be most easily grown in a window without the aid of heat. Half-hardy flowers, among which are some of the choicest window flowers,

* Continued from page 231.

will require some contrivance or other to raise heat and start the tender seeds. It will be easy to do this: place the pots on the chimney-piece, if there is no other convenience; but a box, with a drawer beneath for hot water, and a glass covering, or a jar of hot water placed among the pots, and filled afresh morning and evening, will be better. The proverb "Where there's a will there's a way" applies to nothing better than to some expedient of this kind. The beautiful lobelia gracilis, which droops over the sides of the pot, covered with numberless blue flowers; the erect large flowering lobelia formosa, Chinese primroses, balsams, and those lovely climbers, the thunbergias and maurandyas, can all be raised from seeds, with a very little heat; and, whether they are suspended aloft, and allowed to droop gracefully over the sides of the pot or basket, or are trained over a trellis of wire or wicker-work, nothing adds so much grace or gaiety to a window as a few climbing or trailing plants.

For sowing seeds in pots, there must be about one-third of the pot filled with drainage, and the soil must be sandy. When the pots are filled with earth, put them down into a pan of water until the earth is thoroughly soaked; then take them out and let them stand for about twenty-four hours. Smoothen the surface without hardening it, and then sow the seeds; a good rule, as to the covering the seeds, is to put over each kind of seeds *its own thickness* of sandy earth. Such fine seeds as lobelia, calceolaria, &c., must only be laid on the top of the earth, as almost any depth of covering would prevent a great many of the seeds from ever growing. Over every pot place a square of glass, which will prevent evaporation; when the young plants appear, thin them out, so that those left may have room to grow in. Chinese primroses must, as soon as they are large enough to handle, be put into separate pots, and, if sown in March or April, they will begin to flower about Christmas.

Geranium seeds must have the little awn, or feather, which is at the end, cut off close to the seed, and when the plants are up give to each a separate small pot. As they grow, let them be shifted into four or five-inch pots, in which they will most probably flower the following year.

Fuchsias may be treated in the same manner. The seeds are in large fleshy pods or berries, which, when ripe, are just like red gooseberries; these berries must be carefully bruised in water, and the seeds taken out. The best plan is to wrap them up in paper, keeping them dry until spring, when they can be easily grown, by aid of a little heat.

The Thunbergia seeds will grow very quickly, if they are soaked in water five or six hours previous to sowing. They begin to flower when three or four inches high, and maintain a constant succession of blossoms until winter. The shoots must have the points pinched off as soon as they reach the top of the trellis, or are about two feet long, when hanging down. The blossoms are large, with an intensely dark spot in the centre of each white, yellow, or orange flower.

Balsams are easily raised from seed; they require to be shifted into larger pots as soon as the one they are in gets full of roots. They will live on as much manure and manure-water as would kill other plants. By constantly shifting them into larger pots as they require it, they will grow strong and high, and when well-grown, look very beautiful.

The best way in which to apply liquid manure is to make a pretty strong solution of guano or nitrate of soda, in a small bottle, which keep corked, and add a very few drops of this solution to the water with which the flowering plants are being watered. It is advisable to be very cautious in applying liquid manure to pot-plants; too little suits them better than too much; and it ought generally to be given only to plants which are just going to blossom, otherwise the leaves and stalks will grow too rich and luxuriant at the expense of the flowers.

The cineraria is a favourite pot plant, and it is most easily cultivated from seeds. Indeed, it is much the best plan, in growing this pretty flower, to treat it as a half-hardy annual, unless some very handsome variety is thought worth preserving. The seeds are sown in spring, to flower in winter, and by sowing them at intervals a succession may be kept up for a long period. The cineraria is very subject to the green fly; but a proper attention to watering, and plenty of light and air, will prevent them from attacking the plants. When the plants have done flowering, and sufficient seed has been saved, the flower-stems are to be cut down to the ground; in a short time young suckers will start up all round the pot, and, when large enough, they must be detached and planted out separately.

CITY OF LONDON WORKING CLASSES' INDUSTRIAL EXHIBITION.

The closing ceremony of this exhibition took place in the Guildhall on the 17th inst., when Mr. Ramsay, the honorary secretary, read the official report, in which it was stated that the aggregate admissions on payment during the thirty-five days have been 41,576. Upwards of 2,500 children of the different ward and day schools have visited the exhibition free. The number of prizes awarded by adjudicators chosen by the exhibitors is 193, of which 99 are medals, and 94 are honorary mentions. The total number of exhibitors is 827, exhibiting 1,521 articles, 32 of which were ineligible for prizes. No prizes have been given or awards made but to the actual producers of the articles exhibited, in conformity with Rule 4.

The prizes were distributed by Mr. Peabody, who, in the course of his preliminary address, observed:—"On my part I am bound to say, that whilst I have been constrained to decline many invitations recently addressed to me, I have reserved to myself with peculiar satisfaction the opportunity of meeting the working men of London, whose representatives you are, in the midst of the scene of their honourable rivalry and the display of their most meritorious achievements. Such successful competition as that which meets its due reward this day must be productive of the highest advantage to the people at large, and all classes of the community derive a benefit from the elevating tendency of the persistent industry and skill displayed in the construction of these works of art, which are now about to receive the token of public commendation. Springing as I do from the people, and owning with you the Anglo-Saxon stock, I unfeignedly rejoice in this fresh evidence of the advancement of the industrial classes in the dignity of labour, and in those habits of self-reliance and honest independence which ennoble any people, and afford the surest guarantee of the true prosperity and moral greatness of any country. It is true that these prizes which I am about to distribute are the just reward of your own personal efforts, but I hope you will allow me to remind you, that in receiving your certificate of undoubted merit, you will accept it also as an acknowledgment made by you in this century which will be reproductive of good and redound to the advantage of future generations, who must profit by your laudable exertions in the field of scientific research and in the open workshop of a nation's constructive skill. Should the Great Disposer of all events give to me the happiness of returning to this country, I hope to see the complete success of projects designed by me for the permanent welfare of the deserving poor of this metropolis, and I may then enjoy further opportunities of intercourse with those in whose welfare and happiness I have so great an interest."

In acknowledging the vote of thanks to him for honouring the ceremony with his presence, Mr. Peabody said:—"I feel that instead of proposing a vote of thanks to me for my services, some one should propose a vote of thanks on my behalf for the manner in which I have been received, and the great delight I have experienced to-day in meeting you here, and seeing the great efforts which have been successfully accomplished by so many of the artisans and working people of this country. I trust they will go on and progress in this good work until every working man in London shall feel that he is a man, and has the dignity of a man as much as any individual in the country, however exalted his station. It only rests with themselves to do so. Let them feel that they are in the position to do those things which they have the power to do, and take my word for it they will not only accomplish what they intend to do, but that which will benefit in a great degree this great country, and the whole world. I feel delighted at the manner in which I have been received to-day, and especially delighted to see around me so many of that class of people who have accomplished such results. I say to you, Go on with the work which you have begun, and you will find that in a few years this hall will not hold one-half of the working people that will probably obtain medals at some future exhibition, in acknowledgment of the results of their industrial and scientific excellence."

The closing speech was made by the Lord Mayor, who, referring to the complaints which had been made respecting the alleged exclusion of working-class productions from the exhibition, remarked:—"We have been told to-day that some 50,000 persons have visited this exhibition. I have had frequent opportunities of judging of its character and its conduct. Many of us have been interested, many amused, many instructed, and some few, perhaps—I hope very few—have been disappointed. But we know that there is no human institution, no human work that can be perfect, and this, amongst others, has no doubt had certain defects. If, however, there have been defects, they have arisen not from any want of high-mindedness or honesty of purpose on the part of those who undertook the management, but rather from a want of knowledge and practical experience in the working of such an undertaking. It has been said that the class of persons for whom this exhibition was contemplated was not the working class. But if there was any doubt on any man's mind on that point he should have been here to-day, and have witnessed the honest faces, the rude hands, the intelligent countenances, and above all the independent bearing of those who have come up to this table to receive the reward of their skill and industry—and who are the blood and sinew of the country, which have made us what we are. I am not here to flatter working men; working men, like all other men, have their faults. It is the fashion of the day to talk patronisingly of 'working men' and of 'working classes.' I hold it to be a rule, and a rule I have derived from practical experience, that the working man who lives by the sweat of his brow is amongst the most independent members of society, and my advice to him is not to be patronised, but to go shoulder to shoulder with those of his own order, and, above all, to maintain his independence. He has but to be what my generous friend Mr. Peabody has told him, true to his cause, true to himself, and true to his principles—to be honest, steady, and industrious; and if he have these ingredients in his character, then, I repeat, that no one in this great country is a more noble, a more worthy, or a more independent member of society than the working man."

The proceedings then terminated.

The French Councils of Prud'hommes.

We have recently explained the provisions of the English law with regard to arbitration in the disputes between employers and employed; and the endeavour of Lord St. Leonards to remedy their incomplete and unsatisfactory nature, by a new enactment on the subject. It will be of interest to many of our readers to learn what is done in this direction in France, where Councils of Conciliation and Arbitration have long been in existence, and are still working most effectively.

These Councils are termed Conseils de Prud'hommes—of Wise or Prudent Men—and their origin dates from the Middle Ages. As far back as 1452, one of these councils was established by royal authority, to adjust difficulties between fishermen and their employers. The principle of the council was that an equal number of masters and men should be assembled together, to adjudicate upon all disputes arising in the trade. From time to time, similar councils were established in other callings; but at the close of the last century, owing to various causes—among them, the want of authoritative countenance and support—they had in great measure fallen into disuse.

The First Napoleon, whose wisdom as a lawgiver was often as strikingly displayed as his genius in war, was not slow to perceive the advantages arising from such tribunals, in promoting the peace and prosperity of the commonwealth. He established a law for the formation of trade councils, and their exercise, in certain cases, of the powers belonging to judicial courts. But these councils were not to be constituted in any district otherwise than by the voluntary action of masters and workmen. They were to bear the old title of Councils of Prud'hommes.

The first council under this law was instituted at Lyons in 1806. It was in immediate connection with the silk trade and its attendant callings. The silk weavers of Lyons are a very numerous body, and have not always displayed moderation in pursuit of their objects. On the contrary, in times when labour was ill-paid or but partially employed, they have frequently indulged in lamentable excesses, and disturbed the town by riot and bloodshed. But the Lyonese Council of Prud'hommes has exercised a considerable influence in the majority of disputes between manufacturers and their workmen, and continues to exist at the present day, in greater repute than ever.

The first Council of Prud'hommes in Paris was established in 1844, to adjudicate on questions arising in the metal trades. This was followed, in 1847, by three others—one for the manufactures of textile fabrics, a second for the chemical trades, and the third for all trades not included in the preceding. These four trade councils meet in one building, which is situated in the Rue de la Douane. Other councils have sprung into existence in several of the towns and cities of France.

The Councils of Prud'hommes are elected by the workmen and employers in each district, and consist of an equal number of both masters and men. The president of each council is appointed by the Government. Two courts for the hearing of cases sit in connection with each council. The first is a Court of Conciliation, formed by one master and one workman, whose business it is to see if any case in dispute may not be adjusted by private and pacific arrangement. Here, therefore, all cases are heard in the first instance. The second is the General Court, or Court of Appeal, consisting of three employers and three workmen, presided over by the Government official. Any dispute not settled in the Court of Conciliation is carried to this court of appeal. Matters in which sums up to the amount of 200 francs are involved are settled finally by this court; but in more important cases an appeal lies from the Council of Prud'hommes to the Chamber of Commerce.

The Council of Prud'hommes has other functions besides those of arbitration and jurisdiction between capital and labour. The inspection of workshops, the pronouncing of an opinion to the authorities on matters of labour, and adjudication in apprenticeship cases, with powers even of annulling the apprenticeship, are among these functions. The workmen who sit on the council receive a small payment for loss of time; the masters act gratuitously.

The practical working of these Courts of Labour is simple enough. Any workman who may have a dispute with his employer, or *vice versâ*, may summon the latter to attend before the Council of Prud'hommes on a certain day for the hearing of the case. The cost of the summons is about 3d. On the appointed day both master and workman are bound to appear in person before the council, and each is examined on oath. No counsel is allowed; the Prud'hommes themselves examine and cross-examine, and after deliberating among themselves, announce the decision. Their decision has all the effect of an adjudication by magistrates; they are, in fact, magistrates as far as the matters in dispute are concerned.

The large majority of cases are settled in the Courts of Conciliation—as many as four out of five of the entire number. Something like 50,000 cases are heard in the course of a year by the various councils in France. The tribunals are both respected and popular for the settlement of disputes, and are increasing in number year by year.

The features of these councils are not all in conformity with English views and institutions, but our readers will perceive that the most valuable of them are embodied in the Equitable Councils Bill of Lord St. Leonards. The Councils of Prud'hommes have proved of the highest utility among our neighbours, healing differences and adjusting disputes innumerable, that might have led in many cases to serious consequences both to employer and employed. Why should we not have a similar institution among ourselves?

Electrotyping.

The object sought to be attained by Electrotyping is, by means of the action of the electricity generated by a galvanic pile or battery, to precipitate a metal from its solution upon a given object, in a continuous uniform coating, so that this coating is an exact copy of all the details on the surface of the object. This coating may be adherent, when it is desired to protect an inferior metal by a superior, as when copper is plated with silver; or the coating may be non-adherent, when deposited in a mould, as in the reproduction of antique bronzes, &c.

The electric current employed is usually supplied by the "constant battery," known as Daniell's, or by a Bunsen's battery. The apparatus is either simple or compound. In a simple apparatus, the mould, the object upon which the precipitated metal must be deposited, forms an essential portion of the electric current. In a compound apparatus, the battery is outside the bath to be decomposed; and the mould is connected with the zinc pole; the copper or carbon pole is connected with the bath. The advantage derived from employing a compound apparatus consists in its enabling the operator to attach to the copper pole a soluble electrode, or *anode**—that is, a plate of the same metal as is held in solution in the bath, which plate becomes dissolved in nearly the same ratio as the metal is deposited upon the mould.

Simple Apparatus.—The electrotype apparatus is termed *simple* when the galvanic current is produced in the same vessel as that in which the metallic deposit is effected. It is most frequently employed to obtain deposits of copper, but when deposits of the precious metals are required the compound apparatus is preferred.

Into any suitable vessel (Fig. 1), which may be of glass, earthenware, stoneware, or wood, put the solution of the metal to be deposited—sulphate of copper, *s* (blue vitriol), for example—with which to cover the moulds with copper. Another vessel, P, of much smaller diameter, is placed in the centre of the first vessel; it must be of porous material—unglazed porcelain, for instance. Sulphuric acid, diluted with from twelve to fifteen times its weight of water, is poured into the vessel P, and a plate or cylinder of amalgamated zinc, Z, suspended in it. The moulds, *m m*, are put in communication with the zinc, Z, by means of a copper wire. The solution becomes exhausted of its copper in proportion as it is deposited on the moulds, and must be renewed by suspending a bag of crystals of sulphate of copper in the bath.

Fig. 1.

When operations are carried on upon a large scale, the apparatus may be constructed in the following manner:—A box of any required dimensions, constructed of elm, oak, or any hard wood, is coated inside with pitch, marine glue, or gutta-percha. The box is divided into two compartments by a porous partition, or diaphragm, which may be made of plaster of Paris, or of parchment. If of plaster, it must not be more than half an inch in thickness, so that the intensity of the current may be diminished as little as possible.

The first compartment is nearly filled with a cold saturated solution of sulphate of copper, or of any other salt which it is intended to decompose. Into this solution the moulds are suspended near the diaphragm. The second compartment is filled with water, slightly acidulated, in which a plate of zinc, presenting a surface nearly equal to that of the mould, is suspended, at about half an inch from the diaphragm. When matters are thus arranged, connection is established by means of a copper wire between the moulds and the zinc. As soon as the circuit is closed, an electric current results, in consequence of which the zinc becomes the positive pole, and the mould the negative pole; the sulphate of copper is decomposed, the sulphuric acid and the oxygen go to the zinc, which is dissolved; the hydrogen of the decomposed water then reduces the copper, which is deposited at the negative pole. The solution is kept in a state of saturation, as in the preceding case. The temperature should be maintained between 104° and 107° Fahr., to avoid crystallisation; and as saturation is always more complete at the bottom of the vessel than at the top, the mould must be turned from time to time, quickly, to prevent oxidation.

Another inconvenience is the unequal thickness of the deposit, always more abundant at the extremity opposite to the point of connection

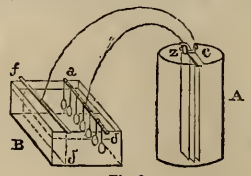


Fig. 2.

than at the point itself. This inconvenience is remedied by placing several conducting wires along both ends of the mould, taking care to turn back those which are fixed to the lower edge.

Compound Apparatus.—The apparatus is *compound* when the galvanic current is produced outside the bath containing the solution to be decomposed. In this arrangement a current of any degree of strength may be employed, according to the size and number of cells forming the battery (Fig. 2). A is the battery, B the vessel into which the solution of the metal to be deposited is placed; the moulds are suspended to a metal rod, *a b*, opposite to which the metal plate, *f d*, is hung—copper, if the solution is a salt of that metal, will serve as the *anode*. The battery being charged, *f d* is put in communication with the copper pole, C, by a copper wire, and *a b* is put in communication with the zinc pole, Z.

Batteries.—The batteries generally employed are those of Daniell and Bunsen. The Daniell battery, as improved, (Figs. 3 and 4), consists of a copper vessel, A B D, about 7 in. in height, 5½ in. in width, and ½ of an inch in thickness, furnished with two appendages, A and B, forming a bevelled pocket, communicating with the interior of the vessel by numerous apertures, and filled with crystals of

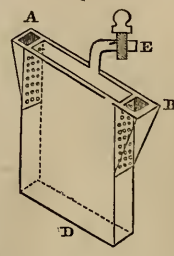

Fig. 3.

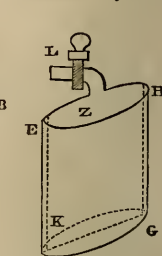

Fig. 4.

sulphate of copper. A saturated solution of sulphate of copper is poured into the vessel, into which a linen bag is immersed, containing a plate of zinc, Z K, 4½ inches wide. By means of two screws, L and E, the conducting wires may be adjusted to the poles, or the zinc element may be attached to the succeeding copper element.

* The *anode* is the electrode placed at the positive pole of the battery, which in the electro-chemical decomposition can be dissolved, or which, if it be insoluble, attracts oxygen and acids.—The *cathode* is the electrode which, placed at the positive pole, receives the metallic deposit, or attracts hydrogen and alkalies.

Coining Dies.

A few weeks back, we gave a description of the various and interesting processes connected with the production of coin at the Royal Mint. It is now intended to supplement the series of papers in question with a description of the mode of manufacturing coining dies, as practised in the same establishment. It is not generally known that dies for stamping money, though made of the finest steel which this country can furnish, are very short-lived, and that the best of them do not last more than a single day. The severe ordeal of the coining press, indeed, very soon defaces the beautiful impressions which ornament them, or else causes their fracture, and thus renders them useless. Hence it is that a continual reproduction of dies is necessary for the successful carrying on of the coinage of the realm; and, at the Mint, one department is devoted solely to the performance of the important work.

The prevalent belief is, that each individual die used for the coining of money or the striking of medals must first be engraved by the hand of a skilful artist; and that, therefore, at the Mint, where both operations are carried on most extensively, a staff of engravers must be constantly engaged in the preparation of new dies. This is by no means an unreasonable supposition—so far as the uninitiated are concerned—but, since it is also an erroneous one, it is intended to remove it, and to substitute in the public mind an accurate knowledge of the system of die manufacturing as actually performed in the great national money factory. Unless we are much mistaken, it will be found that the processes employed in the conversion of bars of Sheffield steel into coining dies are as full of interest as those exercised in any other branch of industrial art.

Undoubtedly, the ancient mode of preparing dies was identical with that which is generally imagined to be in existence now—namely, that of cutting in the various designs and devices upon softened steel blocks, by means of etching tools and gravers, and afterwards hardening and tempering the engraved blocks by the application of fire and water. By such laborious and tedious agencies it was, for example, that the renowned engraver of the days of Cromwell and Charles II.—Thomas Simon—produced the very beautiful

dies used for coining the moneys of those potentates. The same system prevailed until a recent period, when the demand for coin increased a thousand-fold, and when a large staff of engravers would have been required to keep up the necessary supply of dies. As usual in this country, mechanical ingenuity did not long linger behind public necessity, and machinery was devised as a potent auxiliary to the skill and labour of the artist. All that was wanted subsequently was, the guidance of one master mind to devote the new contrivances to profitable purpose, and this has never since been absent from the die department of the Mint, as witness the names of its successive chief engravers, Pistrucci, and the Wyons.

It would not be just to the memory of an individual long since deceased, to proceed with our proposed description of die manufacturing without mentioning his name, because the die manufacturer is largely indebted to his skill and perseverance. We refer to Richard Huntsman, of Sheffield, who invented the very best material for coining dies—cast steel. After many years of patient investigation, and innumerable experiments, made under disadvantageous circumstances, he succeeded in producing this invaluable metal. Briefly, his process of making cast steel may here be referred to, as an acquaintance with it will render what follows more intelligible, and as his plan of operations has not been materially deviated from to this hour.

The melting of bar, or wrought, steel is effected in small crucibles, formed of clay and plumbago, and which are each capable of holding about thirty pounds weight of metal. Ten or twelve of these are placed in furnaces similar to those used in ordinary brass foundries. They are charged with pieces of steel, reduced to a particular degree of softness by annealing, and which weigh about a pound each. Lids of clay are next placed upon the crucibles, and the intense heat to which they are exposed reduces their contents to a fluid state. In about three hours, the molten mass is ready for "teeming." The subsidence of all ebullition, and the dazzling brilliancy of the metal, are proofs of its fitness to pass into the moulds, and into these it is forthwith poured. When cold, the resulting ingots are ready for the market and the workshop. Those which are intended for dies are elongated by rolling into bars, and a batch of these we will suppose to be transferred to the Royal Mint. They are of rectangular form, and of various sizes, in accordance with those of the respective denominations of coin in the British series.

Let it now be imagined that a coinage of florins is required to be struck, and that the entire duties of engraving, sinking, and multiplying a large number of dies of that description have to be performed. The engraver will then first test a bar of cast steel, by observing its grain and texture when fractured, and its appearance when polished. If the results are satisfactory to his practised eye and judgment, this bar will be sent, in the first instance, to the forge, to be dealt with by the smith. One end of the bar will be heated next to redness, and two pieces will be cut off it of the required dimensions for an obverse and reverse die. These are speedily swaged into round form, the hammering serving to increase their density and tensile strength. The two rounded blocks are now annealed, and this is effected by placing them in a wrought-iron pot, surrounding them with animal charcoal, and depositing the whole for some twenty-four hours in a well-heated oven. They are then withdrawn, and allowed to cool gradually. Afterwards the lathe is brought into requisition, and one end of each block is turned flat and smooth. The engraver now takes them in hand, and upon the polished surfaces etches and engraves in intaglio the respective obverse and reverse devices. This is a work which demands close attention and great patience, and many impressions are taken in wax or in soft metal ere the ornamentation is deemed complete and satisfactory. At length this latter consummation is obtained, the letters of the legends and the date are stamped in, and the *matrices*, as they are termed, are, so far as the engraving is concerned, finished.

DESIGN FOR A MIRROR FRAME.

The Artist Workman.

In the production of frames for pictures or mirrors, the taste and ability of the artist workman has the widest possible scope. There is scarcely a limit to the exercise of his ingenuity or power of design. In the choice of materials, too, he has a large field of selection. He can have recourse to the various metals, and display his skill in casting and chasing; he may show his aptitude as a wood-carver; or he may employ *papier-maché*, or composition, as the vehicle for realising his artistic conceptions. Yet our art-workmen, excepting those actually engaged in the manufacture, have seldom employed their abilities in this direction, although it is one peculiarly adapted for the development of their real powers. Flowers, figures, and ornament can be employed singly or in combination with each other, as in the design given above; but care should be taken not to overload the design. The extremes of too much and too little ornament should be carefully avoided, and attention be directed to the attainment of a graceful and picturesque design.

The Mechanical Part of a Prize Essay.

It is proverbial upon what slender things great events sometimes turn. There is some reason for this impression, since no one can tell what link in the chain of causes and effects is the most important; and where each is necessary, every one should be perfect. It is said that the destinies of the world would have been changed had Cleopatra's nose been a quarter of an inch shorter. We have, as yet, whatever we may do in the future, no means of controlling the length of a lady's nose; but the minor events which make up the daily course of duty are more or less within our power, and are worthy our attention. It is true that a person may be led to pay too much attention to details, and be so absorbed by them as to be incapable of taking those larger views of questions and influences which mark the difference between a narrow and a liberal mind. Still it remains true that minor things have their due importance. It is a maxim in mechanics that no machine is stronger than in its weakest part. The powerful engines in the *Great Eastern* will be brought to a standstill if a single pin starts, or the tooth of a cog-wheel breaks. Every piece of the machinery must be equal to the strain it is appointed to bear, or the movements of the whole will be arrested. This is as true in morals as in mechanics. A celebrated French writer has said that the continuity of small duties well discharged is of more importance to society than the striving after the execution of sublime duties. We are not quoting, but paraphrasing the idea of the French writer. Only a very few persons ever have the opportunity of acting conspicuously on the great theatre of events. But everybody is daily engaged in the discharge of those humbler duties which make up the happiness of mankind.

So small a matter as the caligraphy—that is, the actual writing or penmanship—of a prize essay has much to do with its effect and success. We do not mean that nonsense written in an elegant hand would pass, where good sense badly written would fail; but if the good sense were so written that nobody could make it out, what is to become of it?

By good writing, we do not mean fine writing, but plain writing. Elegant writing, as it is called, is often more troublesome to read than what is called a bad hand, if it be at the same time a plain hand. Some persons indulge in so many scrolls and flourishes, that their handwriting is far too elegant to be understood. Good writing—by which we always mean perfectly legible writing—is as scarce as good speaking—by which we again mean plain and distinct speaking. Some time ago, a gentleman advertised for a young man who could write a good plain hand. Out of fifty applicants there was only one who could fulfil the required condition. Though we are making these remarks for the instruction of working men, who have lately been invited, in these columns, to engage in writing prize essays, we are not bringing charges against working men as the only persons whose handwriting is open to improvement. Bad writing is as much the defect of gentlemen as it is of working men. Many distinguished authors write so badly that it sometimes requires an entire printing office to make out their manuscript. Lord Brougham, when at the bar, wrote a hand which puzzled

many a client. During the current debates in the House of Commons there was, as there always is at interesting times, great competition to get names put down upon the Speaker's list. When this is done, the Member of Parliament through whom it has been done will write a letter to his friend, and inform him of it. This gives—that is, the name of the persons on the Speaker's list—the right to be present to hear the debates. At such a time this privilege, to those who must be present, is a priceless one. We, however, saw two instances, a short time since, in which this advantage was lost through the inability of reading the name of the night for which the name was down. Whether it was a Monday or a Thursday in the note of information, nobody could tell, and the nights were lost in consequence.

Perhaps the easiest way to explain the matter we have in hand, will be to take the case of a young workman whom the present writer once knew, who succeeded in winning several prizes at one time. It happened that a series of essays were wanted upon different subjects, yet with one connected purpose. But we may dismiss this part of the subject and the manner and method of thought adopted, it not being our purpose to enter upon that. Our concern just now is with the writing portion of the work. The young man said to himself, "I will take plenty of paper to begin with. It will not make sixpence difference in the cost. I will write only on one side of the paper, so that there shall be no trouble in turning over to follow the reading. I will use a broad margin, so that the writing will not look crowded, and leave space at the top and the bottom for the same purpose, and repeat at the bottom of every page the first word with which the next page begins, as the lawyers do; so that the reading, assisted by the catch-word, may easily follow on in the mind of the reader. My writing must be plain, that it may be as readily read as print. But to have this quality, all the letters must be made uniformly. There are two or three ways of making *r*'s, *s*'s, *y*'s, and other letters. The tops of *d*'s may be square or looped, and so of *h*'s and *l*'s. *T*'s may be crossed at the top or in the middle, according to the patterns adopted. My business, therefore, is, to write out my alphabet, and choose my letters, and always make every letter in the same way, since every variation increases the mystery of the meaning, when the word in which it occurs happens to be obscurely written. There are as many ways of making capital letters as of making small letters. I will, therefore, make an alphabet of capitals, and choose the patterns of those which I intend always to use. Everybody knows that printed letters, capitals or small letters, are always the same pattern, according to the style of the 'fount' used, and from this there is no variation. It is this which helps to make the reading of print so plain and easy. By putting a clear space between every sentence, the composition will be made still more intelligible to the reader. Knowing that every person, however plainly he may write, will write still more plainly if he uses ruled paper, I will therefore buy ruled paper. When my essay is done, I will stitch it in a cover which will open easily, and show all the writing at once, without trouble; taking care, of course, that I use black ink—the blackest I can get—and have white paper to write upon. The importance of black ink is considerable. Probably the intelligibility and the ease of the perusal of a written paper will very much depend upon it. To use a broad-nibbed pen increases, by its bold strokes, the print-like look of the writing. Of course, straw paper is the best to use, as erasures can be more easily made upon that, than upon the hard glazed paper."

New Form of Stay-bars.—The stay-bars or rods which bind together the sides of locomotive and other boilers, are of the utmost importance; numerous explosions having their origin in the weakness or destruction of these, brought on by gradual corrosion. To render their fracture or serious deterioration perceptible externally, the French Northern Railway Company have, for some time past, used tubular rods, the escape of water or steam through which shows at once that they have given way, or are seriously injured. The rods are bored out; but as the diameter of the bore is very trifling compared with its length, this was at first a matter of some difficulty, which has, however, been overcome. These hollow bars have not proved in any way inferior to the solid previously in use. The openings are slightly closed whenever ashes, &c., would be likely to enter them.—*Scientific Review.*

*The Temperance Question in its Industrial Aspects.**

The temperance advocate steadfastly contends that all the evil described by us would be avoided by the general adoption of his principle of abstinence from intoxicating drinks of all kinds; and he is right in insisting that it is not to downright sottish inebriation that these results are chiefly due, but to a love of drink, which finds ubiquitous external facilities to its gratification and daily growth. It is contended, on the other hand, that strict moderation in the use of such liquors would obviate these results; but it is again rejoined (1) that the effort to discover the bounds of this moderation is a task of no small difficulty and danger; (2) that the custom of social drinking is a great hindrance to setting about such a task; (3) that previous habit renders its attainment physically impossible to many; and (4) that, if accomplished, it would be less easy to sustain and less fruitful of good than total abstinence from such intoxicating articles. It is a startling consideration that abstinence, if universal among working men, would bring with it an increase of industrial effort, production, and remuneration equal to the addition of two months to the year. Those who adopt the practice are justified in asserting that, till it becomes the rule, they are deprived of much of the benefit to which they are entitled by their abstinent conduct.

It has sometimes been objected to the Temperance movement that it would only secure its triumph by the annihilation of the lucrative and extensive branches of industry engaged in the manufacture and sale of intoxicating liquors, together with serious detriment to other trades that are subsidiary to them. This objection, however, is entirely irrelevant to the inquiry opened up in this paper, which has respect, not to the liquor traffic as a branch of industry, but to the influence of drinking on the general industry of the country. At the same time, the objection, when proposed, ought not to pass without an answer, which is afforded by the fact, that as the drink-traffic does not create the wealth that supports it, and as the £70,000,000 which do support it would remain to be expended, if not expended in drink, the community, as a whole, would derive equal, if not greater, benefit from another application of the same amount. It is clear that the classes who now live out of this expenditure would be deprived of it; but the same expenditure on other products of industry would be of no less value, perhaps of augmented value, to the labour market in general. The golden current would not be dried up, but, taking another direction, would fructify a larger area of the industrial soil.

Two observations remain. Capital, which is one of the fountain-heads of industrial productiveness, would unquestionably accumulate much faster than it does now, were the Temperance movement to be nationally successful. The working classes cannot become capitalists individually, but co-operatively they may; and we may predict that they would then co-operate to a very much greater extent than they have yet done, were they to save all that is now spent by them in the purchase of intoxicating liquors. Labour and capital would also be on more friendly terms. What is viewed with envy and hatred when in the power of another, may be regarded with delight when in our own possession; and so it would happen, in numerous instances, that English operatives, when capitalists themselves, would change their opinions concerning the nature of that capital on which they had before looked with aversion and dread.

Industry, we may further remark, ought to lead to social advancement. Daily honourable toil ought to raise the toiler in the world. His industry should not resemble the round of a horse in a mill, or the unprogressive movement of a biped on a treadmill. It is true that industry does bring its reward, but if violence is offered to industry by the influence of strong drink, we must expect a corresponding failure in the life career of those to whom this violence has been offered in their own persons. To shut our eyes to facts is foolish and useless; and we cannot be blind to the evidence of all ages that the chief hindrance to the social elevation of working men by their industry has been the degradation attendant on their drinking habits. The old chroniclers tell the same old story, and writers like Defoe and Franklin, whom none can accuse of contempt for labour, or want of sympathy with the manual worker, have repeated the story while they have deplored its truth. Defoe, in his "True-born Englishman," remarks of the workmen of his day—

"In English ale their dear enjoyment lies;
For which they'll starve themselves and families.
Good drinkers' company is their delight;
And what they get by day they spend by night."

Grateful we truly are for numerous proofs of amendment on every side, yet the satire of a century and a half ago is not out of date; and the temperance reformer may boast, whatever some may say concerning the extreme character of his principle, that it would put upon the head of honest industry a crown of dignity, and into its hand a sceptre of dominion, of which the witcheries of the bottle have hitherto deprived it.

* Concluded from page 230.

"A WORKING MAN."

What is this creature, wild or tame,
To keen philosophers a puzzle?
Which scarcely seems two days the same—
Which some would coax, and some would muzzle?
"He'll bite!" cries one. "Not he!" another
In scorn replies. "His features scan;
He's drunk, or sleeps—more one than t'other."
What is it, then, this "Working Man?"

Like that chameleon of old,
Of which we've heard in fabled story,
This creature's coat may lines unfold,
May please a Whig or shock a Tory.
"I'm sure he's blue." "I'll swear he's yellow."
"I see the red all down his back."
"Look, now, he's grey—the dirty fellow!"
"You fool! from head to tail he's black!"

Is he a Christian or a Jew?
You'll hardly tell him by his bearing,
Or know if one 'mong all his crew
Is "fish, or flesh, or good red-herring."
We'll ask, with Shylock, "If he's tickled,
Will he not laugh? Or if he's pricked,
Will he not bleed?" Turn salt, if pickled?
Or stand quite tamely to be kicked?

Ah me! This twaddle makes one sick!
That men should class a fellow-being
As if he were a stone or stick,
Devoid of sense of hearing, seeing!
As if a soul-inspired brother
Were spawn of some unholy brood,
And not—you, I, or any other—
Just simply common flesh and blood!

One might suppose, in this old land,
This England, men had learned to reason
That not to work by head or hand,
Against God's will was simply treason.
And more! That 'twixt the simplest moiler
The difference, vague, undefined,
And him, the loftiest mental toiler,
Was in degree and not in kind.

There are some things man dares to be:
A slave to craving, brutal passion
Of meat, or drink, or ribaldry,
A foppish driveller to fashion;
For worldly gain a blushless liar;
A coward 'neath a falsehood's ban.
Let him dare this, nor fear decryer—
Dare be simply "Working Man!"

W. D.

Warrington People's College.—From the report lately issued by the committee, we find that during the past year the offices in both the boys' and girls' playgrounds have been rebuilt on a greatly improved plan, at a cost of £102 10s.; the buildings have also been thoroughly painted and coloured, and are now in every way in excellent condition. The day schools are in a flourishing and prosperous state. The average attendance during the year has been 217 boys and 97 girls: they have made 108,375 attendances, 4 having been present the whole of the 440 times the school has been opened. We also find that the education now afforded at the college is of a much superior character to what it was when Mr. Brewtnall came to it, in 1848. At that time, when, according to the inspector's report, it was "bordering on extinction," only the three "R's" were taught; now, in addition to these, the pupils receive instruction in the higher rules of arithmetic, algebra, geometry, singing, drawing (314 pupils), and French. These improvements have been made, notwithstanding the fact that 17 new competing schools have sprung up. The number of children educated in the schools since 1848 is 4,744. In 1848 the schools were some £300 in debt, a deficit having been annually accumulating for some years; now they are free from debt, notwithstanding the largely increased expenditure, and of large and successive improvements in the school buildings and appliances.

The Value of Knowledge to Working Women.

Half the human race are certainly entitled to consideration; yet it is only of late years that this now obvious truth has been admitted. Women have been altogether left out of the calculations of those who dispensed public information. We propose in these pages to create a new feature, in which we shall give information which, we hope, will prove interesting and useful to the wives of the working men, and the female members of their families.

It will be in no way necessary to enter upon the peculiar question of the equality of social or other rights of the fairer portion of the human race. That equality, as far as it is well founded in theory, will in due time make its way into practice. It will arrive as general intelligence proceeds. Without increased knowledge it will never be practicable. With knowledge a variety of excellence will spring up; the best qualities of the human family will assert themselves so universally that people will wonder that a question of equality was ever formally disputed. The painter and the poet equally challenge the admiration of mankind, although their arts are so different. The literalness of men and the imagination of women are equally admirable; and, when equally directed, instructed, and refined by cultivation, it is difficult to say which is the more attractive.

Our object, however, in this department will be to furnish useful, and we hope it may also prove entertaining information to working women, many of whom we have reason to know look into our pages. The uses of information are incalculable to the quick intelligence and in the dexterous hands of women. In the humblest ranks of life, few can estimate all its necessity and importance. Mr. James Hole, in his new and valuable work on the "Dwellings and Habits of the Labouring Classes," remarks upon the common complaint of the deficiency of good servants. There is no doubt that young people who go out into families might win for themselves positions of confidence and competence, and come to be counted as valuable members of the family in which they reside, if they had more general and appropriate information. There is no doubt that many women who have risen to the position of mistresses of establishments, and the possession of considerable means, would make far better managers of households, and know better how to consult the welfare of young people in their service, had they themselves, in early life, become familiar with that variety of womanly information which ought to be generally diffused. Ladies of cultivation themselves become conscious of the great difficulty they experience in the management of those they engage, owing to their want of information. Weariness, disappointment, and even worse evils, continually arise in a family through the ignorance and want of common information on the part of servants. A nursemaid without knowledge and good sense is often a calamitous inmate of a house. The little ones must be entrusted to her. The greatest part of their earliest years are spent in her company. Day and night they are under her care. Her language, her manners, her habits come under their notice, and form or infect their minds for good or ill. Her ignorant tales, her superstitious impressions, influence their imagination and live through life in their remembrance, beyond the power of the utmost solicitude of the mother to check, or of the governess, subsequently, to remove. How priceless would be the possession of young persons in these capacities, whose language was simple and correct, whose imaginations were tempered by intelligence, and whose knowledge of the ordinary and simple conditions of health enabled them to influence for good their young charges, and to regulate their exercise and their habits by safe and wholesome knowledge. Such servants would be prized. Instead of changing their situations, as is now the case, continually, they would frequently find a home in grateful families; and, when they had settled themselves in life, live in the honoured remembrance of those whom they had had the pleasure to serve.

The necessity of knowledge is now admitted in every circle of society. People who used to trust in ignorance for security and comfort, have now found out their mistake and their danger. Intelligence is the only thing that can be trusted, and everybody who is intelligent knows it. To the wives of working men it is no less important. The humblest knowledge is not only power, it is also property. It is economy as well as pleasure. What years of sickness, pain and crying, are experienced among the children of the ignorant through a want of the knowledge of the ordinary conditions of fresh air, suitable clothing, and a diet adapted by its quality, quantity, and times of taking it, to the various constitutions of the little people who have to be reared! What waste in the expenditure of the limited means of poor families occurs through want of knowledge of what to buy and how to buy it—through co-operation or otherwise—and how to cook it when bought! An intelligent wife, who gives her mind to household duties, and takes a pride in them, will better feed her family, and give more pleasure at table, upon twenty shillings a week, than an ignorant woman will upon two pounds. In these days the laws of health are so well understood that the doctor need hardly ever enter the household of the poor; whereas in unclean neighbourhoods, unclean houses, and ill-ventilated rooms, his services are constantly required. No professional man gives such honest advice as the doctor. If a tenth part of it was taken he would seldom have to be called in; but it is not taken, because those to whom it is given have not intelligence enough to see its value, nor self-control enough, nor strength of will enough, to act upon it, if they do discern its importance. We say nothing here of the advantage of personal knowledge, veracity, simple directness of speech, expressions of good taste, habits of order, and merciful strength of will: habits of self-trust, of self-reliance, of fortitude and independence of character, of moderation of speech, evenness of temper; all these are qualities which insensibly communicate themselves throughout the little household, in which they are silently exercised. The benefits which thus result to young people in the future of their lives, can never be over-estimated. In a thousand ways we might show, if we went into particulars, that it is quite time systematic attention was given to questions likely to inform and interest women. It is quite as important to the working man that his wife should have information as well as himself; and if we should succeed in supplying information, from time to time, which should prove attractive to the wives and daughters of our readers, it will certainly increase the usefulness of this publication

The Working Women's College, London.

This useful institution was founded with the view of affording working women an opportunity of supplementing the education they have received, more or less satisfactorily, as school children. The term "working women" is used to represent all the various classes of women who are obliged to work for their living, and who therefore, for that reason alone, cannot obtain teaching during the day. The various classes of bread-winners, teachers, shopwomen, workers in all kinds of trades, domestic servants, have enjoyed, very probably, widely different opportunities of education; and coming to a conviction that schooling "should not cease," to use some words of Mr. Maurice, "but that the lessons of life and the lessons of books should always go on together, illustrating and interpreting each other," they will commence self-improvement from different starting points; some will desire quite elementary teaching in reading and writing, while others wish instruction in physiology, Latin, &c. In the arrangements of classes the promoters have studied to supply these varying needs, while in the social life of the coffee-room the students, whether from the preparatory classes or from the advanced college classes, possess the opportunity of meeting on equal grounds, all seeking self-improvement, all helping to create around them an atmosphere of happy interest and friendly intercourse.

The founders of the institution took, as a model of their mode of working, the Working Men's College in Great Ormond Street, in which teachers who have enjoyed large opportunities of acquiring knowledge and culture give instruction and companionship to those who have less leisure, and have had less happy advantages of learning, as a matter of simple duty belonging to their larger powers of usefulness. The name "college" was adopted because, as in the case of the Working Men's College, it was felt to express, better than any other title, the fact of a number of persons forming themselves into a society, for the purpose of carrying out a common work.

Classes have been formed for instruction in the following subjects:—Arithmetic (elementary), arithmetic (advanced), with the elements of algebra, geometry, grammar (elementary), grammar and logic, English composition, English literature (reading aloud), history (English), history (general), social economy, physiology and the laws of health, geography (elementary), geography (advanced), structural botany, drawing, drawing with colour, vocal music, Latin, and French. The college fees are one shilling each class per term, with the exception of the French class, in which the fee is three shillings, and the drawing class, in which the fee is two shillings.

The teachers are Miss Louisa Drewry, Miss Ellen Drewry, Mr. A. Grugeon (certificated teacher of botany, Science and Art Department of Privy Council), Miss Harrison, Miss A. J. Harrison, Miss Hill, Miss O. Hill, W. B. Hodgson, Esq., LL.D., R. B. Litchfield, Esq., B.A., Trinity College, Cambridge, Miss Malleson, Miss A. Malleson, W. T. Malleson, Esq., A. J. Munby, Esq., M.A., Trinity College, Cambridge, Miss C. Scott, A. Sonnenschein, Esq., Mr. G. Tansley (Fellow of the Working Men's College), and Mrs. G. Tansley. There are also several preparatory classes, for preparing pupils to enter the elementary classes of the college. These are conducted by Miss Croyden, with the assistance of some ladies and gentlemen. Among the occasional lecturers are to be found the names of J. E. Cairnes, Esq., Professor of Political Economy in Queen's College, Galway; John Chapman, Esq., M.D., Miss Frances Power Cobbe, M. D. Conway, Esq., Rev. J. Ll. Davies, M.A., F. Harrison, Esq., M.A., J. Hinton, Esq., M.R.C.S., T. Hughes, Esq., M.P., Gottfried Kinkel, Esq., Ph.D., Rev. F. D. Maurice, M.A., and J. R. Seeley, Esq., Professor of Latin in University College, London.

The college is situate at 29, Queen Square, Bloomsbury, London, and no students are admitted under the age of fifteen. The institution is governed by the Council of Teachers, to which students are gradually to be admitted. There is a coffee-room, which is provided with periodicals, newspapers, &c.

Mr. John Stuart Mill, M.P., Miss Harriet Martineau, Vernon Lushington, Esq., Frederick Harrison, Esq., Lady Lyell, Mrs. P. A. Taylor, Mrs. Frederick Hill, and many other ladies and gentlemen, take a deep interest in the progress of the college, and have placed themselves on the list of subscribers to its funds.

Respecting the objects of the Working Women's College, the honorary secretary, Mrs. F. R. Malleson, said, in her address at the opening of the institution, October 26th, 1864:—"We hope to attract to the college those who are in our sense 'ambitious' for themselves—those who feel that they have powers of intelligence and emotion which they have hitherto not cultivated enough—those who would humbly learn to perceive a little more of the wonders and beauty which lie hidden around them in this wonderful world—those who feel that uncultivated and thoughtless women cannot be the real companions and helpmates of cultivated and thoughtful men—those who see that by endeavouring to make themselves nobler human creatures they not only make themselves more fit to fulfil the larger duties of life, but the smaller—I would even say the smallest. For what are called the 'special duties' of women—the administration of home, the management of children—I may be permitted to say no culture can be too wide or too deep, and I think it would not be difficult to show that a girl who trains herself by the learning of a language, or the study of physiology, or history, or drawing, in habits of close attention to small things, in persistency of work and reverent patience, would make a better shopwoman, a better servant, a more valuable worker in any and every department of labour."

True and earnest words these. They breathe the real spirit of self-help and progress, and open to our working women—the co-workers of man in the great world of labour—a prospect of a far wider range of usefulness than was ever before dreamed of.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

We have much pleasure in announcing that the following gentlemen have kindly undertaken the adjudication of the Prizes:—The Right Hon. Lord Houghton; Right Hon. Lord Lyttelton; Right Hon. Lord Talbot de Malahide; Lord Milton, M.P.; Charles Buxton, Esq., M.P.; Rev. Charles Kingsley, M.A.; Rev. F. D. Maurice, M.A.; Rev. J. Begg, D.D.

Working Class Character in Parliament.

The Parliament and the country have been engaged in an unusual way, and with an unusual subject. Our first orators and most influential papers, dailies, weeklies, and even quarterlies, have been discussing the character of the working class. The new feature, however, of the case is, that the charges supposed to be made against them, and which certainly had a suspicious appearance, have been mostly explained away or denied. The disposition of the "governing classes," as they have been politically termed, is unquestionably one of good feeling; and we believe they are little disposed either to speak ill or mean ill; and that if they have, in some individual cases, been betrayed into the use of words of wholesale imputation, their language has been in excess of their deliberate intention.

This theory of their language has corroboration in the course of explanation pursued by the most important person of the whole—namely, Mr. Lowe; who declares that he had in view only constituencies in which are found a lees of the venal, violent, and inebriate. We see no reason to refuse this amended statement. If the inclusive character of the imputation is denied, why should not the denial be accepted? It is no part of good policy to persist in maintaining an accusation. The withdrawal of it is an advantage. The character of the accused then stands clear. The moment the author of a charge restricts it to a portion of a class, he acquits the whole. No class is perfect. The highest have damaged members among them: and the great body of the people are not to be held as unfit for political recognition because some among them, who have never been admitted to citizenship, are wanting in civic virtues.

Mr. Lowe himself is admittedly a man of commanding intellect. He is as impatient of the ignorance which he has had often to confront in the House of Commons, as of that which exists among the people. Feeling his own superiority, he would prefer a despotism of intelligence to a republic of incapability. He is himself an able and faithful administrator. But it will not do to trust to this. After him may come one who has power without intellect and good will. A people who go wrong by their own act are in a fairer way to learn self-trust and acquire wisdom, than a people who go right by the act of another.

Against Mr. Lowe's qualified and half-retracted charges—for he must be held to have made substantial charges against the people—it cannot be said that his political enemies have put the disputed construction upon his words. His own party and the whole of the "Opposition" in Parliament cheered his language, and understood him as the public have understood him. Against whatever he said, or was understood to say, there has been a series of statements made in the House of Commons which confer the highest general character upon the people: and the Government bringing forward a measure for the enfranchisement of an influential portion of the working class, and volunteering to "stand or fall" by their Bill, settles conclusively the fact that the character of the working class is reliable and good, and such as entitles them, upon the highest authority, to enter the ranks of the governing classes.

Of the right feeling towards them, and respect paid them, the conduct of Lord Elcho, who went the other night to a great public meeting of the working classes in London to explain his conduct, which had been called in question by them, is a conspicuous instance. The meeting was, to some extent, prejudiced against Lord Elcho; but they heard him, as became them. He said, with great manliness and fairness, that had he unwittingly wronged them, he regretted it, and would apologise, if it should appear that he had done so, which he denied. The word of a lord is to be believed as well as that of a workman, and it was to the credit of the meeting that they as readily accepted it. Lord Elcho treated the working men as equals in all that pertained to their honour and character, and it was good sense and courtesy to treat him with consideration and hear him with fairness and respect. Amenities like these between lords and working men show that the character given to the people by the Government has been well earned and is well held.

Industrial Art in Paris.—The "Union Centrale," the object of which is to do for France what the South Kensington Museum is doing so well here, is pursuing its course with great spirit. The lecture session commenced on the 9th of the present month of April, and lectures will be given three times a week during the session. It will give an idea of the ability called in aid of the society's efforts to mention that, during the current month MM. Bauderon, Caffe, Rousseau, De Longpérier, and Guillaume, all members of the Institute of France, will address the young working men of Paris on architecture, sculpture, and painting; on sanitary questions connected with the artistic professions; on chemistry in relation to the industrial arts; on the teaching of drawing; and other subjects connected with art education. The library of the "Union Centrale" is growing rapidly in importance, and is open every evening from seven to ten o'clock.

The "Working Man" Lifeboat.

Few industrial occupations entail more of fatigue and danger than that of the seaman. He has frequently to contend with difficulties compared with which those in most other departments of labour seem insignificant, and which demand from him the continual exercise of a steady hand and unfailing nerve—two qualities acquired by a training, commencing in boyhood, of the severest character, and a discipline often more strict than ever was enforced in the best regulated of factories. Romantic and pleasant as the life of a sailor may seem to those who have seen merely the sunny side of it, or who have only beheld the mariner on shore, enjoying—not always wisely—his well-earned holiday, it is certainly anything but one of ease or indolence when once his vessel has left port, and has commenced her silent route across the trackless deep. There is much of discomfort and hardship in the seaman's lot. For months a stranger to the pleasures of home, he has to toil from sunrise till dusk in his floating prison, and when at night he retires to his hammock, he knows not whether the morning will find his ship still proudly flying before the favouring breeze, or defiantly battling with the merciless fury of the tempest.

The large number of shipwrecks annually occurring affords a saddening indication of the hazardous nature of the seaman's calling. The amount of property thus destroyed must be immense. The value of one ship—the *Golden Age*—which was lost some few months since, was estimated at £200,000; and other vessels have been valued at even higher sums: but what of the many lives which have been lost with the ill-fated ships?

We can appraise the worth of gold, silver, and merchandise; but who can fix the value of human life? The lost wealth may be replaced, but the lost lives—never!

There are few working-class families which have not some friend or relative following the occupation of a seaman; and when a gale has been sweeping with destructive violence around our coast, it is painful to note the almost frantic eagerness with which the list of wrecks and disasters at sea is perused by those who are anxious to ascertain the fate of those they loved, and whose arrival home they were hourly expecting.

Sometimes, when a vessel has been lost, the crew have been rescued by one of the boats belonging to the National Lifeboat Institution, and the newspapers are full of eulogies of the gallant feat; but these praises—truly deserved as they are—fall far short of those accorded by the relatives of the men who, through the humanity of man, have been thus providentially rescued from the very jaws of death. We have beheld the lips of the sturdy artisan quiver with emotion as he told us how his brave boy, who, with his fellow-sailors, had given up all hope of surviving the terrible storm which was tossing his ship to and fro, like a child's plaything, on the raging waves, was saved at last by the lifeboat and its dauntless crew; and, knowing this, we are not at all surprised that very many working men should have manifested a strong desire to assist in increasing the number of lifeboats, through the agency of which so large a number of valuable lives have been preserved from the death which at one time seemed imminent.

Consequently, we have much pleasure in announcing our willingness to assist in carrying out the proposal which appeared in No. 13 of the Working Man—namely, that its readers should raise a subscription among their

friends for the purpose of building a Lifeboat, which shall be exhibited at the forthcoming Exhibition at the Agricultural Hall, London, and publicly presented to the National Lifeboat Institution, in the name of the Working Men of Great Britain. With every copy of the present number of the Working Man a subscription list has been issued, containing space for sixty contributions, many of our subscribers being employed in large factories; but the smallest sums will be acceptable in aiding this philanthropic object. It should, however, be stated that, as the Exhibition is to take place early in the autumn, and the boat will have to be built in the meantime, the effort to raise the necessary amount (£400) should be made at once. All subscriptions should be forwarded as soon as possible to the Editor of the Working Man, La Belle Sauvage Yard, London, E.C., enclosing the amount of subscriptions in postage-stamps, or by Post-office order, payable to Messrs. Cassell, Petter, and Galpin.

We shall publish each week, in the Working Man, the amounts received, with the names or initials of the collectors.

Cockerill's Manufacturing Establishment

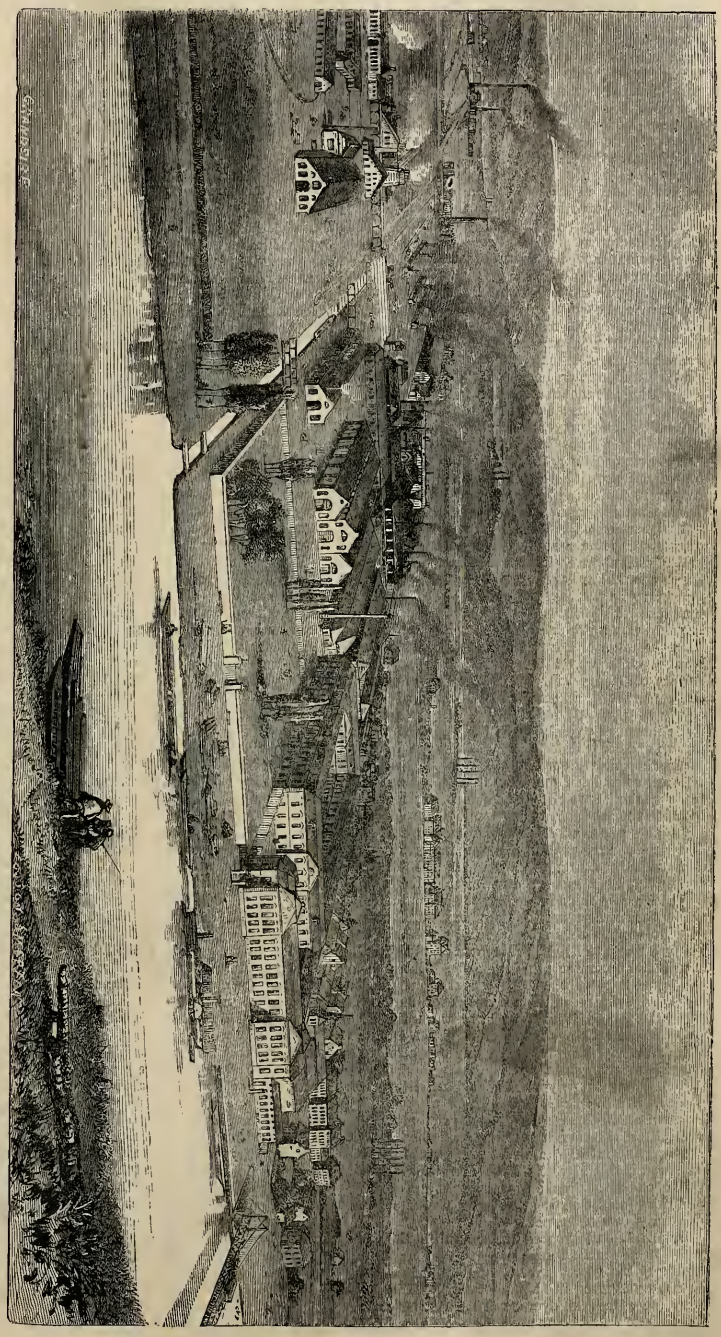
AT SERAIGN, BELGIUM.

This establishment, which stands about a mile to the south-west of Liége, is a vast collection of coal-mines, blast-furnaces, forges, shops for working iron and steel, and machine-shops for the construction of steam-engines, &c. The engraving will give the reader a general idea of the distribution of the buildings. In front, the river Meuse flows from the right to the left, affording a very favourable means of transport, together with the neighbouring railway, for everything required by the establishment or produced in it. On the left, opposite the little canal, a small portion of what is called the "Quartier Saint Georges" is shown. On the other side of the canal, above the garden, we see a succession of workshops, furnaces, foundries, &c.; and beyond are the coke-ovens and the mine "Henry Guillaume," the railway from Namur to Liege, the "Quartier Saint Leonard," and the Collard mine. Following the course of the river to the right, we have before us the ancient château formerly occupied by the bishop-princes of Liége, along which passes, in continuation of the suspension bridge, the road from Messe, at the extremity of which begins the path which leads to the railway station. Lastly, at the right extremity commences the village of Seraign, which in 1821 contained only 2,000 souls, but has now between 10,000 and 11,000.

The honour of creating this establishment, renowned throughout the world, is due to John Cockerill, who, with his brother Charles James, acquired from the Netherlands Government the château of Seraign and its dependencies, to establish machine-shops for the construction of steam-engines, &c. In 1823, John Cockerill became sole proprietor. Seraign then took a considerable expansion; so great, in fact, that William I. of Holland wished to associate the State in the undertaking. The revolution of 1830 broke the contract. John Cockerill sustained the establishment alone, and by means of the railways, which rapidly multiplied at this period, made his workshops of greater importance than ever. Unfortunately, the financial and manufacturing crisis of 1839 surprised him amid fresh plans for the development of the works hitherto so prosperous. He was compelled to make an arrangement with his creditors, although his assets were 26,000,000 francs and his debts 18,000,000 francs only. But he did not lose heart; though it is probable that the violence of his emotions shook his vigorous constitution. He made a journey to Russia to effect an arrangement that would repair everything; but a few months afterwards, on his way back to Belgium, he died almost suddenly at Warsaw. The establishment was saved from immediate ruin by the formation of a company, which has continued the working with remarkable success.

John Cockerill was born at Haslington, in Lancashire, on the 30th of April, 1790. His father, William Cockerill, a skilful artisan, was expatriated in 1797, and after remaining some time in Sweden, established himself at Verviers, where he constructed machines for carding and spinning wool, which operations had previously been done only by hand. In 1807, William Cockerill established himself at Liége, where he constructed similar machines and others for weaving cloth. In 1810, in recompense for what he had done for the prosperity of Liége, William obtained full French naturalisation. He retired from business, and his two sons, John and Charles James, succeeded him. The rest has been told.

John Cockerill was a draughtsman in the workshops of Seraign; he united to a noble and generous soul the qualities which distinguish superior men. Gifted with a vast memory, he stored up only useful matters; he was reserved in his speech, and very simple in his manners, so that every one felt at ease in his society; his workmen looked upon him as a father, and experienced no embarrassment in his presence.



JOHN COCKERILL'S MANUFACTURING ESTABLISHMENT AT SERAIGN, BELGIUM.

The Soane Museum, Lincoln's Inn Fields.—The trustees of this institution, which is situated on the north side of Lincoln's Inn Fields, have issued a notice intimating that the establishment is now open to the public, and will continue so on Wednesday, Thursday, and Friday of the months of April, May, and June, and on Wednesdays in the months of July and August. The collection contains some fine specimens of Greek art,

*The Textile Manufactures of England.**

BY WILLIAM ROSSITER, FELLOW OF THE WORKING MEN'S COLLEGE.

IV.—FIFTEENTH, SIXTEENTH, AND SEVENTEENTH CENTURIES.

The civil wars of the 15th and 17th centuries did the manufactures and trade of England both harm and good. A foreign war frequently does more good than harm to the trade of a nation, but a war on its own soil is generally destructive, though the English civil wars have not proved so. A foreign war frequently infuses into the trade of a nation some share of the national spirit it awakens, and calls forth energy in seeking fresh markets and fresh sources of supply when old ones are cut off. The commercial life of a country sometimes starts afresh with renewed vigour and improved organisation after a civil war has deeply stirred, without, however, destroying, its national feelings. Such was the effect of the English civil wars. Checked for a time, the trade of the nation moved with increased rapidity when peace returned. During the civil war of the 15th century, the towns emancipated themselves, and, by purchase of charters, obtained the right to appoint their own magistrates and to regulate their own internal affairs. The laws respecting manufactures and commerce, made in the 15th century and earlier, have for their chief object the getting as much money, in the shape of taxes, as possible. Afterwards, they took the form of protecting laws, preventing articles that could be made at home from being brought from abroad.

However useless or injurious these laws may be considered now, there can be little doubt that they were useful in the infancy of our manufactures, not as being absolutely good in themselves, but rather as calling out, by force of law, that support of home manufactures, when struggling under difficulties, with a prospect of success, which should have sprung from patriotism. The plant may be healthy, the ground good, and the fruit desirable; but the early life is tender, and requires care and protection.

In the reign of Edward IV., the importation of woollen cloth was attempted to be prevented. An act of Henry VII. fixed the price of scarlet cloth at 16s. per yard, and of cloth of other colour at 11s. Under Henry VIII., the woollen trade increased greatly, until the war with Spain put an end for a time to the trade in the Netherlands, then nearly our only market. Both nations suffered so much from this that a commercial truce was made, to allow of trade being resumed between them.

In the reign of Charles II. was passed the Navigation Act, prohibiting the importation of any goods into England, or any of the English dominions, by means of any but English ships, excepting only ships belonging to the countries of which the imports were the produce. The object of this was to secure as much as possible the English trade to English merchants and sailors.

The silk manufacture in England dates from the latter part of the 15th century, but was of little importance until the reign of James I. Queen Elizabeth is said to have worn the first pair of silk stockings made in England, and the story adds that she prohibited any one else from wearing stockings of that kind, being desirous of enjoying a monopoly no doubt pleasant to her vanity. Up to this time, stockings were usually made of cloth, though occasionally silk stockings were obtained from Spain. The Arabs had carried silk-weaving into Spain, and the Normans had introduced it in Italy. In 1520 France conquered Milan, one of the great silk-weaving towns of Italy, and introduced the art into Lyons, now the great silk emporium of France.

James I. endeavoured to naturalise the silk-worm in England, and planted a great number of mulberry-trees for them to feed on, but it came to nothing. Failing in this, he invited silk-throwsters (or spinners), dyers, and weavers from the Continent, and the manufacture of broad silks was established.

In 1629 the silk-throwsters were incorporated by charter, and in 1661 the company employed some 40,000 men, women, and children in London. In 1685 some 500,000 Protestants, chiefly weavers, left France, rather than conform to the Catholic religion; and of these, about 70,000 came to England, giving, by their knowledge and skill, great impetus to the silk trade. A great number of these refugees settled at Spitalfields, where some of their descendants still carry on the same trade.

In 1718 the first silk mill was worked in England, set up near Derby by an Englishman named Lombe, who went to the silk-weaving town of Piedmont disguised as a common weaver. Obtaining entrance by bribery, he watched closely every process of the manufacture, and made drawings of the machinery. When he was quite familiar with the whole art, he returned to England, carrying with him the fruits of his trouble, acquired with more cunning than honesty, and for which he nearly paid with his life, being discovered, and narrowly escaping, at the moment of his departure.

Lombe's mill cost £30,000 in the erection. This sum he is said to have raised by setting up small machines, worked by hand, by means of which he wove and sold silks at prices below those of the Italian make, and yet high enough to give him a good profit. He took out a patent for fourteen years, but nearly the whole of the time was consumed in erecting his gigantic mills, five stories in height, and one-eighth of a mile in length. He applied for a further patent, but it was considered too important a matter, and a grant of £14,000 was given him instead of the patent.

* Concluded from page 234.

*Working Men's Clubs.**

BY THE REV. H. SOLLY.

THE HISTORY OF A FAILURE.

The history of every human enterprise contains, more or less, a record of failure. Those whose success alone is manifest to the world have had many secret disasters or checks. The people who succeed in this world are those who *learn* from failures, *without being discouraged by them.*

Having remarked on various successful clubs, and on some partially so, let us now glance at the reasons given for failure complete enough to end in closed doors. About twenty such have come to my knowledge out of 300 clubs established, making little more than six per cent., which is a wonderfully small proportion, considering how we have all had to grope our way, and learn by (often) trying experience.

One night in December, 1862, two zealous friends of the working classes were sitting together in the town of S——, deeply deploring the amount of intemperance and vice among the active workers around them, and feeling utterly disheartened at the powerlessness of all efforts to check it. At the same time I was posting to one of them the prospectus of our Union. On receiving it the next morning, my friend ran with it to his companion of the previous night, and in high glee exclaimed, "This is the very thing! The problem is solved for us. Let us get to work immediately." They did so with their characteristic energy—distributed our papers widely, collected funds, got up a capital meeting, which was attended by the members for the borough, several of the clergy and influential inhabitants, and a great number of working men. Before long they had established a large and prosperous Club in admirable premises, and had enrolled from 1,000 to 1,200 members. But alas! by the summer of 1863 there were "roots of bitterness" springing up within the club, while radical defects of organisation also began to tell on its prosperity, and in about a year after the Club was closed. In the autumn of that year, 1864, I visited the town for the first time, and met, by invitation, its principal supporters and managers, among the gentry, the tradesmen, and the working men. At two conferences (the second being more largely attended) the whole question of the causes of its break-down was very fully gone into, and the following were generally admitted to be the chief reasons of failure:—

1st. The double Committee system—one of gentlemen and another of working men.

2nd. The admission of youths and lads.

3rd. A steward who got drunk.

4th. Introduction of Theological questions at the Discussion meetings.

5th. Not enough management and supervision by the Committee.

In addition to these formidable elements of mischief, many speakers alluded to the unhappy jealousies that sprang up between different leading members, and the factions that were consequently formed. All agreed that there was not enough of the corporate or "society" spirit. There seemed no bond of union among the members; comparatively few who seemed to be animated by a disinterested desire to promote the common good. The following are a few of the remarks made in the course of the two conferences:—

"We began with too great expectations, and, therefore, on too large a scale. The rent of our premises was very high (more than £60), and the rate of subscription (1d. per week) too low. Hence it could not be self-supporting." *Comment.*—This last opinion, I think, was mistaken; for their premises were large enough to accommodate the average number—say, one-third—who would attend at any one time on ordinary nights, and the two-thirds, or three-fourths, likely to be present at entertainments, even if they had retained 800 or 900 weekly members; for that would have given them an income of about £180, amply sufficient in itself, with good management, to have paid all ordinary expenses. Then, the same good management would have got a considerable profit from Penny Readings, Concerts, &c., and also from the sale of Refreshments.

"We had too much success at first. We thinned the public-houses to such an extent, that their owners took the alarm, and used a great many new devices to compete with us." *Comment.*—No doubt this was true. Soon after the Club was opened, one of its members wrote me thus:—"Our Club, although it has been in operation but a few weeks, has wrought such a blessed result, that there is scarcely a street or a poor man's home in S——, but what has felt its cheering, happy, and peaceful influence. Here are two significant facts—*The wives of our labouring population are rejoicing in the establishment of the Clubs;* and those who thrive on the vices of the people are praying that the Club may soon be burnt to the ground. . . . I have examined the books of the Police Office, and find that, from the time our Club was opened—on the 28th of February—up to the 9th of April, there has been but one case of 'drunk and disorderly;' while before that time scarcely a day passed without one or more, and during the corresponding period in last year there were no less than twenty-six cases."

Mr. ——, a working man, and one of the original active promoters of this Club, in writing to the *Times* soon after, well observes: "What, it will be asked, are the advantages to be gained by being identified with these Clubs? The blending instruction with recreation and amusement. Among the great number of men who thus congregate together are to be found the better class of workmen, the indifferent, and those who previously spent their spare time in drinking and loose company, with some even of the offscourings of society."

There can be no doubt concerning the great amount of good which this Club accomplished during its brief career. After it had been shut up some time, a working man coming up the street, sorrowfully asked a member of the late committee when it would be opened again, adding, "I never used to spend less than twelve shillings a week in that public-house (pointing to one across the street) till the Club was opened."

The remarks were continued thus:—

"Jealousy and ill-feeling showed itself between the two committees as soon as the first difference about spending money arose."

Comment.—I have already dwelt fully on this fatal mistake of having two Committees.

"There was great opposition shewn to the Club before long by the religious bodies of the town, both Church and dissenting."

"The religious discussions did us great harm. One question was, 'Is the Bible the only proper rule of life?' and this raised a great stir among the Roman Catholics, both in the Club and out of it."

"When the Committee, by a majority of one, stopped the discussions, the Club went down at once. Scarcely any came to the discussion meetings afterwards."

"The Committee ought to have excluded Sectarian publications if they excluded religious discussions."

"The Club had gone before those discussions began. There was enough to ruin it without that."

"There wasn't enough supervision as to the subjects for discussion generally. No limit, either, as to the time for each speaker."

* Continued from page 250.

Comment.—While I believe that Discussion meetings are of the highest value in these Clubs, so long as Theological topics are excluded, there is no doubt, as I have often urged, that, independently of higher grounds, their introduction is most mischievous, from the strength of feeling, not to say passion, aroused by their leading to the inevitable result of members becoming irritated with one another, and leaving the Club from the unpleasant feelings thus engendered. There can be no "good fellowship," which is the basis of those Social Clubs and Institutes, unless men consent to keep their strong antipathies or hostile convictions in abeyance while meeting on a common social platform, and make their Club thoroughly unsectarian in every sense of the term. But it does seem very sad that large numbers of the religious bodies in the town, when they saw practices going on in the Club to which they justly objected, should have manifested the active hostility to it which they appear to have done, instead of helping its better-disposed members and devoted friends to improve its constitution and management. They would have had abundant power to do this had they given sympathy previously. There is too much reason to fear that many of the followers of Christ in this town lost a great opportunity of serving their Lord when they joined in denouncing and closing, or refrained from assisting, the S—— Working Men's Club and Institute.

"We (the Committee) were always a crotchety lot—we could not agree very well together, and then we consulted the opinions and prejudices of the outside public too much. Working men must manage their own club, and go their own way, without minding what is said about them."

"There were men in that Club from the first who meant death to it."

"When the religious discussions were stopped, the Saturday evening entertainments fell off. Some of our best singers stayed away."

"Ay, but the chief cause of their falling off was that the pianist, whom the Committee had engaged at 2s. a night, was offered 5s. by a publican, and left the Club."

"Well, but the Committee offered him anything reasonable to come back, and then found he had been promised a situation in addition to his pay. We tried everywhere, in vain, to get another in his place."

"The expenses being so heavy, a great deal had to be done in the way of getting up entertainments. But all that took up a vast deal of time—more than the Committee could afford. And no regular and suitable chairman was appointed, either for the 'Free-and-Easy' or for the Discussions."

"There was sometimes great uproar and confusion . . . a general want of good management, in fact."

One of the principal founders and managers, after summing up the discussion and admitting the correctness of most of the foregoing remarks, concluded by saying, "But all these difficulties and disasters might have been lived down had not the expenses been too great for the income. Nothing else would really have broken up the Club."

Comment.—No doubt the deficiency in the balance-sheet finally caused the Club to be closed; but the expenses, as I said above, were not at all out of proportion to what the income could and would have been with efficient management. The real, essential defect, next to the double Committee, was the disproportion between the magnitude of the operations *and the staff to conduct them.* There was much zeal and judgment, much disinterested and efficient labour, but not enough for the undertaking; and a good deal of what there was does not seem to have been always applied in the right place. If a few of the gentlemen who formed the upper house had sat instead on the working men's committee, winning their confidence and just supplementing their efforts; if other gentlemen, outside the Club, belonging to the various religious bodies, had shown cordial sympathy and given judicious help, in all probability a very different result would have been obtained. The fact must never be lost sight of, that to manage and work a Club and Institute a very considerable amount of time and energy must be devoted to it, proportioned to the scale on which its operations are conducted.

But the effort was not in vain. It left some good results which will not soon pass away. And many of those who, through the melancholy failure of that club, are now gone back to their old wasteful and demoralising ways, or sunk again in stupid apathy, will occasionally be the better for remembering that they once rose out of that state into one better and happier. "No effort is lost," says one of England's greatest men; least of all an effort bearing such good fruit for a time as the one above described. May its benevolent promoters keep up heart and hope, learn by experience, and go to work again at the fitting season with renewed energy.

A letter from the late President of the Club, just received, says, in answer to my inquiry, "There is a Temperance and Benefit Club now in S——, doing part of what a Working Men's Club would have done better. Some of the most useful men in the town, however, have joined it."

In a former note he expressed a great hope that they might be able to begin once again on a smaller scale; but hitherto they have not seen their way to this.

Facts and Memoranda.

The late Mr. Marner (of the firm of Laurie and Marner, coach-builders, Oxford Street) has bequeathed legacies to clerks, assistants, and others; also legacies of £10 to each of the numerous workmen employed by him.

In Mr. Siemens' gyrometric governor for steam-engines a large metal cup dips into water, and produces a regulating effect by its overflow, in combination with wheels by which that effect is transmitted to the engine, whatever may be the amount of resistance. In this way the defect in action upon the valve which prevails in Watt's governor is successfully overcome.

The great prosperity of Marseilles is owing to its soap manufactories, which are sixty-two in number, and annually consume 1,200,000 cwt. of oleaginous seeds, 150,000 cwt. of olive and other oils, 250,000 cwt. of raw sulphur, 425,000 cwt. of soda, 29,000 cwt. of nitrate of sodium, 165,000 cwt. of sea salt, and 200,000 tons of coal. Every hectolitre of oil yields 159 kilogrammes of soap.—*Galignani.*

Patents.—It has been decided by Vice-Chancellor Wood, in the case of "Dangerfield *v.* Jones," that if, having a particular purpose in view, a person takes the general principles of mechanics, and applies one or other of them to a manufacture to which it has not before been applied, this is sufficient ground to warrant an application for a patent, assuming such manufacture to be new, desirable, and of public utility.

Singular Effect of Compressed Air.—The effect of compressed air in determining the entrance of a large quantity of air from the atmosphere, was curiously exemplified by a recent experiment of M. Galibert. He took one of the bags he uses with his respiratory apparatus (described in our No. 12), which held about six-and-twenty gallons, and had an aperture at the top about four inches wide; and, keeping the aperture open, projected into the middle of it, during four or five seconds, a small puff of air compressed by the mouth and lips. After this he closed the aperture by pressing the edges together with his fingers, then shook the bag, and struck the bottom of it against the ground. It was now one-third full of air—that is, contained nearly nine gallons, while the air which had caused the entrance of this large quantity did not amount to half a pint. He repeated the operation twice, which made the bag quite full of air. The development of this principle might tend to useful results in ventilation.

Protection of Iron from Oxidation.—The extremely thin sheets of iron which may now be obtained, some of them weighing no more than 0·36 gr. per square inch, and not being more than the 4,800ths of an inch in thickness, have been noticed as possessing to an extraordinary degree the power of resisting oxidation. There is no doubt but that this is attributable to a fused layer of magnetic oxide, with which they are always covered; and the fact has been applied to the protection of articles of wrought iron. They are embedded in a pulverised layer of native oxide of iron—hematite, for instance—and kept at a full red heat for several hours, after which they are allowed to cool gradually. Plates treated in this way are perfectly coated with the oxide, and are well suited for ship-building. A combination of the oxides of zinc and iron, formed by the use of oxide of zinc in a similar manner, produces a black coating, which is, perhaps, even more effective.—*The Scientific Review.*

Electricity in a Cotton Mill.—The *Lowell* (Mass.) *Courier* says: "It is a general truth that friction developes electricity, and most workmen know that a machine belt at high speed, by its friction with the air, is highly electrified. It has for years been a common experiment for a workman to light gas burners by holding one hand to a fast-going belt, and the other to the open burner. This matter was curiously demonstrated in the Appleton Mills, of this city, on Wednesday. A strong smell of fire being noticed, the premises were carefully searched, and a small quantity of cotton lint, inside a belt casing, was found on fire. The lint lay upon a beam which was within four inches of a belt some fifteen inches wide, and moving some 220 revolutions a minute. In the beam was an iron bolt, the head of which was towards the belt. From the belt to the bolt was passing a stream of electric sparks, which had set the cotton lint on fire. After attending to this case, Mr. Motley, the agent, opened the casing of a similar belt in another mill. The beam in this case was fourteen inches from the belt, but the stream of electric sparks was at once seen jumping across the beam, although it had not set fire to anything. Perhaps some of the cases of fire from supposed 'spontaneous combustion' are due to electricity from machinery. The subject is an interesting one for investigation, and probably a profitable one."

A Bird's-eye View of the House of Commons

DURING THE GREAT FRANCHISE DEBATES.

The reputation of the House of Commons is rising: not merely that its eloquence is sustained, and even is increasing, but that the public interest about Parliamentary proceedings is greater than ever, and continually augments. Public attention concentrates itself upon the characteristics of our law-makers. This is a wholesome sign. For good or evil, the English House of Commons is one of the most powerful agents known. For whatever improvement can come through political arrangement, the British people must look there for it. The composition of the House of Commons—the proceedings in it—are, therefore, of increasing importance, and it is useful that its conduct should be scanned, and the principles avowed there understood.

The House was again crowded on April 12th, when the debate on the second reading of the Franchise Bill came on, as it was on the previous occasion, described in a former number. Mr. Gladstone—no longer "dull" by design, as he has confessed, as on the night when he introduced the Bill—approached the table this night with an elastic step, and in an animated voice announced that he should now supply any defects in the way of giving reasons for the Bill, which were remarked upon in his first speech. He took a high tone. He said that successive Parliaments—that both great parties in it—had equally pledged their honour that Reform should take place; and the obligations of their own honour were reasons sufficient and imperial for introducing the Bill. Then he convicted Mr. Horsman of having formerly advised the course the Government now take, and of having been the "hot" advocate of piecemeal Reform. It is well known, as Lord Palmerston once remarked to the Member for the Ayr Burghs, that he thought bit-by-bit Reform was the right course to take. Mr. Gladstone thrust at Mr. Disraeli, who had claimed to deal with the enfranchisement of the people with "sincerity." He twitted Mr. Disraeli with having afterwards retracted his profession, hinting that he had had experience in that art; for

"Ease will retract vows made in pain."

He next attacked the *Quarterly Review* (his friend, the publisher, having supplied him with an early copy) and analysed its statements with irony, scorn, and sparkling vehemence. Lord Cranbourne is understood to be the author of the article which Mr. Gladstone replied to. Turning upon Mr. Lowe, he answered him, amid a storm of cheers, prefacing his reply by remarks of high courtesy, which is the grace of our Parliamentary manners, saying, what we repeat here in fairness to Mr. Lowe, who is very much attacked at this time. Mr. Gladstone said, "He is a man of whom I freely confess that, in my judgment, he is not more eminent for his extraordinary intellectual power—in many respects never surpassed, and rarely matched in this House—than he is entitled to the utmost respect for his integrity." Mr. Gladstone was never more varied and vivacious than in this great speech. There was fire in every passage. His quickness of repartee is unsurpassed by any living speaker—unsurpassed is too feeble a word: it is unequalled. He caught up every interjection. He challenged every cheer from the Opposition. Each emotion of the opponents before him he remarked upon. Nothing escaped him—nothing disconcerted him. His energy of speech was so striking, that his lowest tones were heard in the galleries. He sat down with one of the shortest perorations on record,

praying the House to use no more "mocking words," but to "be wise, and be wise in time." These words—pronounced with immense force and earnestness—were followed by prolonged cheering.

Mr. Lowe rose to say he should speak in reply on another evening. He had then to protest against the "wilful" and gross misquotation to which his words had been subjected. These were not happy terms to employ. "Wilful" is an ugly word to use when complaining. To charge others with "wilfully" misrepresenting, was to make the accusation he complained of. Mr. Lowe has been understood to mean more than he meant, but this has not occurred "wilfully."

Lord Grosvenor's speech was on behalf of a motion to postpone the Bill until another Bill was added to it for the Re-distribution of seats. The effect of this amendment would be to get rid of the Bill. Now, if lordliness means, as it should mean and does mean, pluck and frankness, a direct negative of the Bill would have fared better in Lord Grosvenor's hands. He had much to say for his course, but he has an uneven voice, often indistinct, and great hesitancy of manner. Yet he went through his work with steadfast courage, and said always what he wanted to say—somehow, and preferred to hesitate to speaking nonsense, which was greatly to his credit.

Lord Stanley, however, made the great speech of the amendment party. His lordship speaks in a jerky, guttural manner, which mars the fine effect of his language. He has what Mr. Bright has well described as "a passionless impartiality." He has the clearest, the most liberal, and the most candid intellect of all the Conservative party. His language has a matchless precision. He wastes no words, and he never lacks the right one. He knows what the question is to which he speaks, and he keeps to it. He never wanders from it, and never confuses it.

The Marquis of Hartington spoke; but a party speech is out of his way. In his own department he has solid qualities, but he has neither the quickness, adroitness, nor fire needed for controversy. He is strongest in the dull fields of official duty. Being a marquis, it was thought a respectable thing to put him up to answer two lords (Grosvenor and Stanley), but he fell into the use of the most awkward expressions, capable of a double meaning. The first meaning was right enough, but the sharp-eyed and quick-witted Opposition always caught at the second, and shouted with laughter, which caused him to adopt other equally ill-chosen terms. But he stood to his guns with coolness, and kept firing away such ammunition as he had, until the last charge was expended. He is a steady gunner, but does not take good sights at the enemy.

General Peel, who has a hearty, heavy kind of wit, made one of his most amusing speeches. His jokes have a rhinocerean gravity. He quoted anything that rhymed, as though it were poetry. Alluding to the Government saying that "honour, morality, and respectability" required the passing of the Bill, he demanded why the Liberal party had not brought it forward six years ago. Where had been their "honour, morality, and respectability" during Lord Palmerston's ministry? These virtues might exclaim with the epitaph—

> "Weep not for us, my masters dear,
> We are not dead, but sleeping here."

The quotation was not deficient in homely humour.

If a man could be benefited by criticism, or made wise by contrariety of opinion, Mr. Bright ought long before this to have attained perfection. No man was ever so constantly discussed as the "hon. member for Birmingham." Every speaker refers to him. The ancient sage was of opinion that men would be kept in the path of virtue, or at least be instructed in the way they should take, could every man see himself in a mirror. To see himself as others see him would aid him materially in forming a correct judgment of his own actions. Mr. Bright certainly has more than this advantage—he not only sees himself in one mirror, he sees himself, or what is declared to be the reflection of himself, in some three hundred mirrors, in the House of Commons; for certainly half the members of that House refer to him, quote from him, call attention to him, remark upon him, criticise him, in every speech they make. Bacon said that if out of every man's mind could be taken all conceits, imaginations, rumours, conjectures, leaving only the residue of actual fact and real knowledge, every mind would be found in a very shrunken state. If out of the debates of the House of Commons Mr. Bright and his opinions, and the criticisms they command, were cancelled, instead of the *Times* being required, the *Pall Mall Gazette* would contain the debates. But whatever differences of opinion may be expressed as to the views and principles of the member for Birmingham, the frankest and most honourable testimony is borne to what Mr. Gladstone lately styled his "extraordinary powers." This is one of the pleasant traits of Parliamentary courtesy in which Mr. Bright himself is not deficient. The extremest opponents who join in contests of supremacy in the House of Commons constantly say the civilest things of each other; and having regard to the lustre Mr. Bright confers on Parliamentary oratory, his greatest opponents will say of him as Peel said of Palmerston on the delivery of his memorable five hours' speech—"We are all proud of him, though we don't like him."

THE LAUNCH OF THE *NORTHUMBERLAND*.

The successful launch of this vessel, representing a dead weight of 9,000 tons, must be regarded as one of the most interesting and instructive experiments in iron ship launching recently made, especially when we take into consideration the nature of the difficulties with which the operation was attended—difficulties so serious that at one time a successful result seemed almost impossible. The object of the preparations made after the first failure was to lighten the vessel partly by the stern; and for this purpose four large camels, or pontoons, were attached by means of strong chains—two on either side of the stern of the vessel—the chains passing under the ship's keel. Each of these camels was fifty feet long, twenty-five feet deep, and twenty feet extreme width. The united lifting power of these four camels was estimated at 2,000 tons. In addition to this power there were the six smaller pontoons previously used, and the other appliances of steam-tugs, hawsers, and capstans. The *Northumberland's* ways also, during the previous week, had been taken up, and re-laid to the extent of about 200 feet at the midship section and bow, and her sliding timbers had been considerably widened, which, it was considered, would keep the ship from hanging should she once start. New foundations and timbers of great strength to support the hydraulic rams were placed under her bows, and the hydraulic pressure was nearly double that used on the previous occasion, being now 1,500 tons. On each side, to work against the bilge logs, were placed two presses, exerting a combined force of 1,000 tons on each side, to start the ship down the ways. A number of hogsheads, also, the united floating power of which equalled 100 tons, were lashed under the bows to aid in lightening her there, and relieve, as far as possible, the pressure to be thrown on the forward part by her being lifted at the stern. On mature consideration it was resolved to dispense with the teams of horses on this occasion, as also with the use of derricks to assist in raising her. As the tide rose towards high-water mark, the shores were all knocked away and the blocks removed. Then the signal was given for the driving out of the dog-shores, and the next moment the giant mass was seen to move. There was no need of hydraulic pressure. The power of the machinery at the bows was not evoked. The ship moved of herself, and, gliding grandly down the ways, floated safely, and without accident to any one on the river.

Things Talked About.

We chronicle, in another column, the reception of Mr. Peabody at Guildhall. Few nobler men have heard the shouts of welcome in that ancient hall. With characteristic modesty, he has declined the invitation to a banquet offered by a large number of the leading bankers and merchants of the City. Mr. Peabody is, essentially, one of those philanthropists who "do good by stealth, and blush to find it fame."

On the subject of trade combinations, a singular story is related by a correspondent of the *Times*. The possibility of introducing machines for brickmaking has often been discussed; and we were prepared for the opposition the operative brickmakers were likely to offer, but not for the extraordinary support they were likely to receive from the members of other trade societies. But, according to the writer mentioned, a company having raised capital for undertaking the making of bricks by machinery, engaged a builder to erect the necessary premises. Then it was found that no bricklayer would lay a brick of the edifice. A wooden erection was then decided on; but builders to whom the contract was offered, were told by the builders' union that, if they undertook the work, the whole of their hands would quit work. It being hopeless to attempt the erection of a brick chimney shaft, an iron cylinder was obtained; but to raise it, shears were necessary. These could not, for some time, be procured, in consequence of the active agency of the unionists. At length, a builder offered to furnish them. He was sent for by the union, and advised to have nothing to do with the work. He took the hint; and neither brick nor wooden building has been erected. The iron cylinder cannot be raised, and the company is idle. Such is the nature of the opposition to the introduction of machinery still to be encountered, and so stoutly is the opposition backed up. But the machinery will come into effect, nevertheless, and the men had best make up their minds to accept the fact.

A novel question was discussed in the Court of Exchequer a few days since—nothing less than the money value of a poor man's wife! We do not mean to say she was actually offered for sale, and that the learned judges were called upon to fix the price. The fact was, she was accidentally killed on the South-Eastern Railway, and the husband, having brought an action against the company, had obtained £200 damages. The company appealed to a full court, and asked for either a reduction of the amount or a new trial. What pecuniary loss has the husband sustained? asked the counsel for the company. Mr. Baron Martin had equally good sense and law on his side when he said, "If a poor man's wife is not of pecuniary value, then I don't know what is." The woman in question was forty-seven years of age, and left four children. No court of law can supply the place of a wife and mother, or even estimate her value; but the Court did all it could, by confirming the verdict of the court below, Baron Martin saying, "It was a mercy to the company to refuse a new trial, as it must result in a substantial loss to them."

The cattle plague is decreasing, and that is good news. The weekly returns show that the number of animals attacked is barely one-fifth of the number five weeks since. So meat at a moderate price may again be looked for.

Notwithstanding Fenianism and other troubles in Ireland, the deposits in joint-stock banks in that country increased in the years 1865 and 1864 by a sum of £2,628,376, and that increase is the largest that has ever been recorded—indeed, twice the amount of 1850, and three times what they were in 1840. There seems to be, then, no lack of money in the sister island, and that confirms what we have recently stated, that industry there is surely and rapidly thriving.

The "blue-book" of the Registrar-General of Victoria, for 1864, has just reached this country. From it we may see how our brothers at the antipodes are progressing. Something else than golden nuggets is building up the Empire of the South. There were 538 manufactories of various kinds in the colony. Our temperance friends will not be pleased to hear that seventy-four brewers were at work, producing annually more than 6,000,000 gallons of beer; but, to counterbalance that, we find that ninety-three mills were at work, converting 2,000,000 bushels of wheat into flour; and the corn crop was reaped by 998 reaping machines. There were more than 9,000,000 of live stock. The extent of the colony is nearly 87,000 square miles, about half as much again as that of England and Wales, and yet the inhabitants did not number more than 626,530; considerably less than that of the county of Kent, and greatly below that of the Tower Hamlets. So there is plenty of room yet for what some writers call the surplus population of the old Anglo-Saxon kingdom.

The Nottingham Dining Hall has been a great success. In the first four weeks it was visited by 24,266 persons, who spent on an average 2¾d. each. Among the articles of food used there have been consumed 1,390 eggs, 7,168 rolls, 910 loaves, 3,130lb. beef and ham, &c. Probably the greatest number of visitors in the middle of the day take the 4½d. dinner, and in the morning and afternoon coffee and an egg.

A circular just issued describes the progress of the Crossley Orphan Home and School, founded in 1864 by Messrs. John, Joseph, and Francis Crossley, of Halifax, who spent nearly £60,000 on the site and building, and endowed the school with an annual income of £3,000. In order to extend the benefits of the institution, benefactions and bequests are received. There are 400 children within the walls, all of whom receive the rudiments of a sound education; and the more promising pupils are specially instructed in Latin, one modern language, algebra, and geometry. "Both boys and girls are so trained as to fit them for fighting the battle of life courageously, and with that kind of self-reliance which is consistent with intelligent dependence on Divine help." The brothers Crossley, blessed with affluence, have used it nobly, and bequeathed to posterity a splendid memorial of the liberality of great employers of labour.

Sir George Grey has stated in the House of Commons that the Government is not prepared with any measure for regulating the employment and education of children employed in agriculture, who certainly stand in as great need of friends in high places as their little brothers and sisters in the factory districts.

The men employed in the carriage and wagon department of the Great Western Railway are following the example of the workmen employed by other companies, and are asking for an increase of wages. The question is daily growing in importance; and there are few demands of the kind with which the public generally would feel greater sympathy.

The successful result of the strike of the tailors employed by Mr. Poole and other tradesmen at the West End, has encouraged the operative tailors of the City, who held a meeting at the City of London Theatre, and pledged themselves to use the utmost exertions to obtain a rise

in the rate of wages. The Edinburgh tailors having struck, some fifty German tailors have arrived from Hamburg, and have signed an agreement pledging themselves to work on the masters' terms.

The strikes at the Consett Ironworks, and at the Newcastle Gasworks, are at an end.

Co-operative Intelligence.

Bacup.—From the report of the Bacup Co-operative Society, it appears that the association consists of 2,457 members, and that during the year 222 have been admitted, while 170 have withdrawn. For the last ten years the society has paid a quarterly dividend of 2s. 4d. in the pound to the members on their purchases. In connection with the store is a library, containing 1,583 volumes. The seventy-fifth quarterly report of the society has just been issued, from which we learn that, during the quarter ending March 28th, the amount received for goods has been £20,356 7s. 2½d., and the net gain on the quarter's transactions, £2,655 15s. 6½d., which enables the directors to declare a dividend of 2s. 5d. in the pound on members' purchases, and to the reserve fund £81 19s. 7d., and leave a surplus of £36 19s. 11d. unappropriated.

Beeside Co-operative Society.—The members of this society recently held their sixth quarterly meeting. The report was read by the secretary, and approved of by the members. The sales for the quarter of twelve weeks had been £1,046 1s. 7d. After devoting £5 15s. to reduce the value of the building, paying interest money, and all working expenses, the balance of profit was £103 15s., giving a dividend of 2s. 2d. in the pound.

Temple Town Industrial Co-operative Society (Limited).—At the eighteenth quarterly meeting of the above society, the secretary read the report, from which it appeared that the society was in a very healthy condition, twenty-six new members having been enrolled during the quarter, and one withdrawn, making the number now on the books 150. The sales for the quarter had been £1,196 15s. 0½d., being an increase of £250 5s. 4½d. on the preceding quarter. After paying all expenses, the amount of profit applicable to dividend was £95, which enabled the committee to pay 2s. in the pound on members' purchases, dividend being paid on all goods except sugar. The members resolved to commence butchering on their own premises as soon as practicable.

Desborough Industrial and Provident Society.—The sixth quarterly balance-sheet shows that the society have done business to the sum of £271 11s. 8d., which, after paying management, interest, depreciation, &c., allowed the committee to declare a dividend of 1s. 7d. in the pound on members' purchases, and 10d. in the pound to non-members, leaving a balance in favour of the society of £1 19s. 6½d. The capital is steadily increasing, and the number of members on the books is fifty-six.

Consett.—At the eleventh quarterly meeting of the Industrial and Provident Society, the quarterly report which was read showed an increase of sales over last quarter of £404 9s. 8½d., and an increase of profits of £38 0s. 8d. Thirty-one new members had joined, and eight had withdrawn during the quarter. The total receipts for goods sold had been £2,602 14s. 9d., and the gross profits, after paying working and other expenses, was £203 5s. 7d., which enabled the committee to declare a dividend of 1s. 11d. in the pound on members' purchases.

Blaydon Co-operative Store.—The quarterly report here showed a balance of £820 17s. 5d. profit on the last three months' operations, which, after allowing £56 15s. 5d. for depreciation of fixed stock and other payments, left £764 2s. to be divided amongst the members, being a dividend of 2s. 2d. in the pound on the purchases.

Moulton.—The fifteenth quarterly report of the Moulton Industrial Society shows the business done to be £1,004 4s. 0½d., being £92 9s. 10¾d. more than the corresponding quarter last year. The net profit gained after paying all management expenses was £97 1s. 8½d., which enabled the committee to pay a dividend of 1s. 11d. in the pound on members' purchases, 6d. to non-members, five per cent. interest on paid-up shares, besides providing liberally for the reserve fund, depreciation of fixed stock, &c.

Seaton Delaval District.—The sixth quarterly report showed that goods to the amount of £123 7s. 5d. have been sold per week, being £19 2s. 10d. above the weekly average of last quarter. After paying interest upon capital, and allowing for fixtures, there was left to be divided on members' purchases the sum of £139 9s. 1d., which gave a dividend of 2s. 2d. in the pound. Forty new members had joined during the quarter, and five had withdrawn, leaving 202 on the books.

Manchester and Salford Equitable Co-operative Society.—We learn from the twenty-seventh quarterly report of this society, that during the quarter there have been 235 new members admitted. The sales in the grocery department, amounting to £12,298, shows an increase of £965 over last quarter, and of £2,580 over the corresponding quarter last year. The sales in the drapery department, amounting to £880, are not so large as last quarter. This may be accounted for, in some measure, with last quarter being Christmas quarter, always one of the best in the year. The sales are, nevertheless, £240 more than the corresponding quarter last year. The net profits amount to £872 17s. 9d., which were to be disposed of as follows:—For depreciation of building and fixed stock account, £63 16s.; non-members' purchases, £93 17s. 6d.; educational purposes, £21 9s.; Royal Infirmary, £5 5s.: a dividend of 1s. 6d. in the pound being paid on members' purchases. In the educational department, to make the society increasingly popular, and with a view of benefiting the members, a course of three lectures on scientific and literary subjects has been delivered in the Large Hall, Downing Street; and, in order to induce a large attendance at each of them, a mere nominal charge was made for admission. A Mutual Improvement Association has been established, which meets every Tuesday evening, at half-past seven, at the Central Store. The meetings are devoted alternately to discussions, readings, conversation, recitations, &c.; and the members and their friends are earnestly invited to attend. The library, consisting of upwards of 1,000 volumes, is now open every evening during the week, from seven to nine o'clock, and this arrangement will, it is hoped, better meet the wants of the members.

General Information.

CLUBS AND INSTITUTES.

All Souls (St. Marylebone) Club.—The members of this club, in conjunction with those of the St. James's and Soho, with the view of carrying out the objects of district organisation, recently held an animated discussion at the rooms of the above club, on "Working Men's Clubs" generally. The chair was taken by Mr. J. W. Marshall, secretary to the All Souls. Several of the speakers, in discussing the question of the admission of youths into the clubs, stated as their opinion that no members should be admitted unless they are at least twenty-one years of age; and the arguments used and instances recited of clubs having failed in consequence of the admission of young members, went far to prove that the *lowest* age to which members should be admitted to Working *Men's* Clubs should be fixed at twenty-one, while other speakers concluded that the principal aim of the clubs should be to reclaim the younger members from the influences of the public-house, and that eighteen was a proper limit to the age of members. Other subjects in connection with Working Men's Clubs were discussed—viz., the introduction of beer into the clubs, and the necessity of district and central organisation, the generality of the speakers being in favour of them. The meeting was finally adjourned to Wednesday evening, 18th April, at half-past eight o'clock.

Working Men's Club and Institute, Crewe.—An interesting and important meeting was held recently at this great railway centre, in the Town Hall, to establish a Working Men's Club and Institute, for the use of the large body of men employed in the company's locomotive works at Crewe. The hall, which was granted for the evening by the company, was quite full. The chair was taken by J. Webb, Esq., C.E., one of the principal managers of the works, and Mr. Potter, one of the foremen, then explained what had been done hitherto in the matter. The chairman then introduced the Rev. H. Solly (to whom the managers had given a free pass for his journey), who entered fully into a description of the objects and uses of a Working Men's Club, earnestly inviting the men to have one of their own, similar to those that have been found so useful elsewhere. Mr. Fisher and other working men having advocated its establishment, Mr. Winstanley, hon. secretary of the Crewe Mechanics' Institution, cordially urged the value of such an institution, which, he said, would occupy different ground from the one of which he was the official representative, and would at the same time ultimately promote its prosperity. They had an excellent attendance at their classes, and above 400 members, but many of these were not artisans; and even if they were, what were 400 out of 5,000, the number of fitters and labourers actually employed by the company? A working man in the body of the meeting said he had come prejudiced against the movement. He had a comfortable home himself, and wished everybody else had, and he feared the club was against the home. But, from what he had heard that night, he saw he was wrong, and he should warmly support the effort to establish the club. The meeting, which grew quite enthusiastic towards the close, terminated by hearty votes of thanks to Mr. Solly and the chairman.

Social Meeting, Exeter Hall.—The first of the series of social meetings, under the auspices of the Council of the Institute Union, was held on Wednesday evening, April 18th, in the Lower Hall, Exeter Hall. The Earl of Lichfield, who occupied the chair, said the subject for discussion that evening was, "How far are the disadvantages under which the working classes labour attributable to causes within or beyond their own control?" An immense improvement had taken place in the condition of the working classes during the last half century. But there was yet much—too much—to be done. He believed it was for the working classes to do most of that which remained to be done for themselves; yet he always felt a deep satisfaction, whenever he attended a meeting of the working classes, at the readiness with which they accepted any proposition on the part of others to help them with the work they had in hand. He therefore thought that those who, like himself, had worldly advantages with which the working class were not blessed, could not better occupy their time than in assisting, as far as they could, to elevate the condition of those below them. It was for that reason he was present. He did not pretend to say he was in a position to give them much advice, but he attended to hear what those who represented the working classes had to say on the subject for discussion. Mr. John Bainbridge, a working man, then read a paper on the question for discussion. Mr. Layard, M.P., briefly addressed the meeting. He had attended some of the meetings of the club last year, and derived great instruction from the discussions which took place, and which were carried on with calmness, good sense, and moderation. Several working men took part in the discussion, and hearty votes of thanks, moved by Mr. Solly and Mr. Hodgson Pratt, to Mr. Bainbridge and the noble chairman, closed the proceedings.

Working Men's Club and Institute Union.—The Council beg to give notice to the Committees and Secretaries of the Metropolitan Working Men's Clubs and Institutes, that they propose forming a District Union of all these societies within the postal district, on the plan found advantageous in the provinces, with a view of promoting friendly co-operation between them, and mutual benefit. It is therefore earnestly requested that the committee of each club desirous of joining the District Union, should they approve of its constitution and plans, will send a delegate to their office on Thursday evening, April 26th, to confer on the subject, and to make such arrangements as may seem to them desirable. Three members of the Council of the Parent society have been appointed to meet the delegates on the occasion. Among other benefits which it is hoped may arise from the proposed union, and which may be discussed at the forthcoming meeting, are an interchange of free admissions to the London clubs, so that members of one club, if visiting or working in the neighbourhood of another, may have a welcome in the latter for a few evenings without payment. Also a system by which courses of lectures and exhibitions of dissolving-views, of pictures, wood carvings, &c., might be organised to take place at various clubs on successive nights or weeks. Also, an interchange of friendly visits, either simply for good fellowship or for discussion; also matches of chess, draughts, or bagatelle, &c. Also, arrangements for joint excursions in summer, and conversazioni, classes, &c., in winter. These and various other advantages are anticipated from judicious organisation, and the Committees of the London Clubs are requested to give their representatives any general instructions regarding them, or any other suggestions that may seem advisable. No interference, of course, in the management or arrangements of individual clubs is in the slightest degree contemplated. As some of the metropolitan clubs, recently formed, may not have yet sent their names and addresses to the office of the Union, their managers are now invited to do so, in order that information may be sent to all alike as to the plans and advantages of the proposed District Union. A. H. Layard, Esq., M.P., is expected to preside. Tea on table at 7 p.m. The conference to commence at 7.30 p.m.—Henry Solly, *Organising Director.*

WAGES AND STRIKES.

The advance of wages movement is gradually extending to all parts of the kingdom, the men, in most cases, obtaining the required advance, and, in some instances, a reduction of hours of labour also. In a few cases, the employers have anticipated the demands of the men, as at Ashton-under-Lyne, where Mr. Hugh Mason has notified to the whole of the hands employed by him that their wages would be advanced ten per cent. Notices to a similar effect were also issued by the Co-operative Spinning Company. On the 19th inst., a numerously-attended meeting of the members of the London Master Builders' Association was held at the Freemasons' Tavern, to take into consideration the resolution of the delegates of the men, passed on the previous evening, respecting the advance of wages to 8d. per hour. After an hour and a half's discussion, the following resolution was adopted:—"That an advance of one halfpenny per hour be given to the most skilled mechanics; the less skilled to be at liberty to accept a less rate. The hours of labour to be nine per day, from the 9th of November to the 24th of February, and ten for the remainder of the year. The labourers to be advanced one farthing per hour on the same conditions. The advance to commence on the 5th of May next." This resolution is almost in the same terms as that adopted by the delegates, with the exception of the distinction drawn between the "most skilled" and "less skilled" mechanics; and it is possible that some hitch may arise upon this point to prevent so speedy a settlement of the question as is desirable. This point arranged satisfactorily, the question will be settled. The delegates meet again this week, to decide as to the acceptance of the above resolution, and the only difficulty likely to arise is the vagueness of the second sentence in the resolution.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE CULTURE OF WINDOW PLANTS.

To the Editor of the Working Man.

Sir,—I am very glad to find that you are about to give us some papers on window gardening, as it is a subject which I know to be very popular with the working classes, and one which is calculated to do much good by fostering a love of the beautiful. I had the management of a show of window plants in the east of London last year, which proved very successful. We had handbills printed, stating the particulars of the proposed show, with the rules as to the competition for the prizes. We also gave away about £5 in money prizes, which I think the people like better than any others. We did all we could, by means of the bills, to make the show known in the parish, and we found the people, for the most part, eager to share in it. The rules should be as few and simple as possible—just stating who may compete for the prizes, that the plants will have to be duly registered within a given time, and that they must remain in the parish, and under the care of the registered exhibitor until the time of the show. We held the show in July, and Lord Lyttelton came down to give the prizes, and made a speech, in the course of which he expressed his pleasure and satisfaction at what he had seen. We kept the show open for three days, and it was visited by a great many persons. We gave free admission to exhibitors and their wives; to others we made a small charge, the proceeds going towards the prize fund. In conclusion, I would say that what is chiefly wanting in order to make the show successful is perseverance and patience.—I am, Sir,

An Hon. Secretary.

THE INCREASE IN THE RATE OF WAGES.

To the Editor of the Working Man.

Sir,—In your notice of the London tailors' strike and lock-out, you ask working men for their views as to the possibility of the present general rise in wages being permanent. I feel sure the present rate of wages will be permanently maintained as a whole, for the following reasons:—First, the leaders of opinion among working men see, that owing to the immense amount of gold which has been brought from the bowels of the earth since the commencement of the mining operations in California, Australia, New Zealand, and British Columbia, the value of the precious metals has depreciated, and money has decreased in value; or, in other words, everything that money purchases in the market has risen in price through it, so that the working classes of England, as far as the law of supply and demand is operative in this case, are really worse off for it, for the amount of gold their labour is worth now purchases them less of the necessaries of life, and the present general rise of wages is only the labour, among other marketable commodities, going up relatively as gold comes down. Some one may here interpose, and say that this, that, or the other thing is not dearer now than heretofore. If so, I reply, the causes mentioned have prevented it becoming as much cheaper as it otherwise would have done, owing to free trade, unshackled commerce, and the invention and application of machinery.

In the second place, becoming more acquainted with the laws of supply and demand, the operative classes, rather than stand a lowering of the present rate of wages, would act upon the supply of labour by raising funds for emigration; and while the great republic of the West keeps in operation the "Homestead Act," offering to emigrants the splendid inducement of eighty acres of good land; and, owing to the operation of the laws of entail and primogeniture, the persevering artisan of England is practically prevented from acquiring possession of eighty feet of the soil of "Mother England," hundreds of thousands would be willing to try their fortunes in what now promises literally to be "the home of the free."

In the third place, as co-operation becomes more thoroughly understood and appreciated by the working classes, they who now strike to rise, and would strike again to sustain the present rate of wages, will see that their wisest policy lies in forming among themselves co-operative societies, limited liability companies, &c., and by working their capital as merchants, tradesmen, manufacturers, builders, contractors, &c. Taking the fruits of their industry into the markets, not only of England but of the world, they will rightly ascertain for themselves, free from the combinations of mere capitalists, the actual worth of their labour. And believing, as I do, that the reason why the Englishman gets more wages is because he does more work, of head and of hand, than those who get less wages around him, I have no fear of the results of the trial. I believe wages will increase and the time worked decrease, till things find their proper level.

I am, Sir, yours, &c., G. E. M.

THE EDUCATIONAL FRANCHISE.

To the Editor of the Working Man.

Sir,—One of your correspondents says the remarks respecting the "Whitechurch Working Man's Club" are damaging to the cause of Reform, because they say Mr. Clay's Educational Franchise Bill would not be complete without the ballot. I contend they are right: by the present system a man cannot, as a rule, *conveniently* vote conscientiously. He is obliged to vote for or with his landlord, or accept the consequences (look at the recent eviction of tenants by the Marquis of Bath, for instance); or else his cupidity and covetousness are tempted and satisfied by bribery, and so he is induced to sell his conscience and his interest in his country's welfare. Your correspondent says such a man is not fit to be entrusted with a vote. Well, suppose we admit that; if the rule is a good one, it will work two ways, and we shall agree that the man who first proposes these abuses and breaks the laws must be the worse of the two, and not at all qualified to be a law-maker. If it is not illegal to force a man to give up the keeping of his conscience to another, it is illegal to bribe; and how many of our M.P.'s could with truth say they have not directly or indirectly been guilty of it, not to mention the sickening deceit and dissimulation practised by many of them just before an election, by the sudden interest they affect to feel for their constituents and their families? Then, again, just look at the last election—what a fearful amount of drunkenness and rioting throughout the land; murders committed, outrages of every description, and a senseless destruction of property; and all this is inseparable from the present system.

I can scarcely believe any moral man (leaving his religion out of the question) could advocate such a state of things in preference to managing it in a quiet, orderly, systematic way; which would be the case, I am quite sure, if the voters were protected by the ballot; and I am sure we should gain immensely by the change, because the candidates for Parliamentary honours would then have to stand on their merits, and not on their monetary influence. I have been told by a person who has resided for many years in Australia that the ballot answers extremely well there; and if the colonies are allowed the privilege, and gentlemen who are Members of Parliament have adopted it at their clubs, I am quite sure there can be no good reason for withholding it from the electors of England.—I am, Sir, yours respectfully,

Chas. Galton,
A Member of the W. W. M. Club.

To the Editor of the Working Man.

Sir,—In answer to your invitation to working men to give their opinions on Mr. Clay's Bill, I, as a working man, wish just to state my views on that Bill. I think Mr. Clay's Bill is far better than the Government Bill, for it would give the franchise to all who are worthy of that privilege. It is easy of attainment; and that man who would not exert himself to obtain that knowledge which would give him the franchise, on Mr. Clay's principle, is not worthy of holding so sacred a trust. It would be within the reach of all, and such a Bill we want; nothing short of that will satisfy the country for any length of time. But, sir, I am sorry to see the opinions that prevail amongst many of those of the working class who write to the Working Man respecting the franchise. Some would have a test of one kind, some a test of another; but I think, in general, they who would throw various obstacles in the path of others are men who are already beyond those obstacles. Some would establish a kind of Inquisition, respecting whether they attended any place of worship, and what place, and so on. One of your correspondents in No. 14, who is a schoolmaster, would admit all schoolmasters who have obtained a Government certificate or diploma, &c., or all who had insured their lives for £100, or bought an annuity of £20 per year, and paid three years' premium in either case, or have not less than £50 invested—very good for those who have been so fortunate as to be in a position to accept those tests. I suppose the writer "S." is in that position, or he would not have written in the strain he did respecting those who have not been so fortunate. He thinks they who possess property, as a class, are more intelligent than those who do not possess it, and, even if ignorant, their having property proves their power of self-denial. I think it proves nothing of the kind. As regards intelligence, there are thousands of intelligent working men, who have to struggle hard to gain a scanty livelihood for their wives and families, who did not marry in their teens, as "S." sneeringly insinuated, but have prudently and manfully battled with all the difficulties and troubles of a large family, or sickness, or death, and want of employment at times, and many other things which beset the path of the working man, who cannot be surpassed for general intelligence, in a political point of view, by many of our certified schoolmasters, and I might say M.P.'s as well.

The property test is no test at all, as thousands of persons at the present time hold property which entitles them to a vote; but as regards the machinery by which the country is governed, they know no more about it than the aborigines of Australia: they inquire or read a little about the corn and potato markets, and that is the extent of public business they are acquainted with. I admit, sir, that there are great numbers among the working class who are in a state of ignorance, but I attribute that more to the temptations placed in their way than anything else; and I think the working classes have given their opponents a strong proof that, if they had the power, they would remove those temptations out of their way, which blind and keep in ignorance so many of our fellow men—I mean those dens of infamy, the drink shops. That, sir, is one reason why I think the franchise ought to be extended to all on the principle of Mr. Clay's Bill. It is a sorry spectacle to see the working man, who, having enjoyed good wages and gained the privilege, or the man who has obtained a good education, saying to those beneath as regards property or education, "Stay where thou art, or make thy path through the same purgatory whence I have come." Excuse me, Sir, for trespassing thus on your space.

Goole, April 9, 1866. S. G. Larner.

WORKING MEN'S CLUBS.

To the Editor of the Working Man.

Sir,—I have read the Rev. Mr. Solly's paper on "Working Men's Clubs" in your valuable journal of this week, and, I regret to say, can confirm from personal experience the truth of his remarks; in fact, he not only does not exaggerate the evil, but scarcely estimates it sufficiently, if I am to judge by some of the remedies he proposes.

At the club to which I have the pleasure of belonging, we admit members at eighteen years of age—in my opinion, three years too young. The conduct of these youths has been extremely bad, and we have done nothing at present to remedy it.

Mr. Solly says that, when we cannot provide separate rooms, we may safely admit them to the reading-room and library. I say, not safely; for that is where I find them very troublesome—annoying other members with loud talking, laughing, and often practical joking; and at concerts and entertainments, when they are nearly all together, they will persist in being noisy, and are worse than impertinent if interfered with. Such conduct will be fatal to the best-managed club.

With regard to the proposition for admitting youths as associates, I consider the recommendation to be founded on quite an unsound basis—in fact, it would be quite as bad as making them full members. It is nothing but the same thing in another form; and nothing short of separate accommodation will be of any use. Our club is at present in a prosperous state; and my only fear is that we may eventually suffer from this evil, of which we have already had complaints.—I remain, yours truly, D. H.

April 16th, 1866.

THE YORKSHIRE MINERS.

To the Editor of the Working Man.

Sir,—In the report given in No. 14 of the Working Man respecting a mass meeting held by the West Yorkshire miners, there are some slight mistakes. Their union has not benefited them 10s. per week, but 4s. 6d. per week; they are trying to get 5s. for eight hours, and not for seven hours, as stated; they are endeavouring to reduce their work to five days per week, because two-thirds of the West Yorkshire mines are thin mines, varying from two feet to thirty inches thick, giving off large quantities of gas, and the miners think five days sufficiently long to be cooped up in such places.—Yours respectfully,

J. Dixon,
Secretary to the Miners' Association.

TO CORRESPONDENTS.

W. Clarke.—The subject treated in your letter does not come within our range of topics.

Planet (Staleybridge).—We could not undertake the responsibility of choosing a society for you. The articles were published with the purpose of enabling working men to make their own selection.

Mechanic.—Operatives are not disqualified as such from attending the Central School of Art at South Kensington. The principal qualifications consist of a certain amount of proficiency in drawing, and proofs that the art-knowledge sought to be acquired is intended for industrial purposes.

Inventor.—It is a difficult question to decide, merely upon *ex parte* evidence; but a somewhat similar case recently occurred at Dudley, in which a collier sought to recover damages from his employer for illegal dismissal from work. The facts deposed to were simply that the plaintiff, in February last, declined to "hang on," because the shaft was not safe, and defendant, therefore, told him to go. It was clearly proved that the shaft was not safe, and that during the last part of plaintiff's working there a brick had fallen, which might have seriously injured the man. The judge considered it most important that it should be known that men were not compelled to work when and where it was dangerous, and that masters must take all proper and available means to protect the lives of their men. This was a clear case. The plaintiff refused to work because the shaft was not safe, and he was quite justified in so doing. The verdict would be for £2, as plaintiff admitted he could have got work under the fortnight had he chosen to do so, and he had no right to accumulate damages.

John Samuel.—No such Bill was ever passed. There is a Statute of Limitations, which debars the recovery of debts after they have been incurred six years, and nothing has been paid on account, and no acknowledgment of the debt paid.

Perseverance.—You require an impossibility: we must refer you to a treatise on type-founding, which you may find in any large Cyclopædia.

C. W. Y.—1. The value is not more than half-a-crown.
2. Both sons can take up their freedom.

J. W. Sedley.—Apply for the money due, and, if it is not paid, sue the debtor in the County Court.

J. D.—There is no such work published at present.

E. D.—The vessel for holding the sulphuric acid in which the gas is generated, and such parts as are exposed to its action, must be constructed of lead or glass.

A Contributor.—We have not seen any of the portable clay ovens you inquire about.

Eccles, B.—The safety gun-paper is proposed by the inventor, Mr. G. S. Melland, as a substitute for gunpowder and gun-cotton. It consists of paper impregnated with the following mixture:—Chlorate of potassa, 9; nitrate of potassa, 4½; prussiate of potassa, 3½; powdered charcoal, 3½; starch, $\frac{1}{16}$; chromate of potassa, $\frac{1}{16}$; water, 78 parts—all by weight. These ingredients are mixed together and boiled for an hour. The solution is then ready for use; and the sheets of paper are passed through it, rolled, and dried at 212°.

Asroria.—The aneroid barometer was invented by M. Vidi, a French mechanician. It has lately been much improved by M. Breguet. Compared with the ordinary mercurial barometer, its indications are found to be thoroughly reliable.

Canton.—There are no means known by which plaster of Paris can be revived after being once saturated with water, which chemically combines with it.

Baker and Baker's True UNCOLOURED TEAS are imported and sold Free from all Adulteration; they can, therefore, be relied on for Uniform Good Quality, Fine Flavour, and Lasting Strength. Sold by Chemists, Confectioners, &c., in most Towns. [14

By Royal Command, Metallic PEN MAKER TO THE QUEEN. JOSEPH GILLOTT Respectfully directs the attention of the Commercial Public, and of all who use STEEL PENS, to the incomparable excellence of his productions, which for Quality of Material, Easy Action, and Great Durability, will ensure universal preference. Economy in Kindling Fires.—Four Fires are lit by the PATENT FIREWOOD for One Penny, without trouble to servants. No paper required. Sold by Grocers and Oilmen.—Works, 18, Wharf Road, City Road, N. Packed for the country, 500 for 10s. [25

Walker, Hatter, 49, Crawford Street, Corner of Seymour Place, Marylebone, London. Hats in all shapes from 3s. 6d. to 18s. each.
The Trade Supplied. [26

BROWN AND POLSON'S
PATENT CORN FLOUR, Recommended for CHILDREN'S DIET. [27

E. Bourdon's Patent Gauges. GIFFARD'S INJECTOR, FOR FEEDING STEAM BOILERS. DIAMOND PAINT, FOR IRON AND WOOD WORK.
Particulars and Prices post free on application to
W. T. HENDRY AND CO., 73, QUEEN STREET, LONDON, E.C. [28

THE WORKING MAN WILL FIND
"Judson's Simple Dyes" both Useful and Amusing. Any one can use them. Anything can be dyed with them in ten minutes. Price Sixpence per Bottle. Of Chemists at Home and Abroad. [29

FURNITURE ON CREDIT.
Furniture can be had at 83 and 84, CHARLOTTE STREET, FITZROY SQUARE, W., and paid for weekly or monthly. The articles can be had away immediately. Apply personally, or write to E. THOMAS, 83, Charlotte Street, Fitzroy Square. [30

Arnold and Sons' Improved IMPERCEPTIBLE TRUSSES, Acknowledged to be the lightest and most comfortable wearing Truss yet invented. ELASTIC STOCKINGS, KNEE CAPS, &c., for Varicose Veins, Weakness, &c. Abdominal Belts, Railway Conveniences, Crutches, Artificial Legs, Hands, and Arms, and every description of Surgical Appliance manufactured by
ARNOLD AND SONS, 35 and 36, West Smithfield, London.
N.B.—Directions for Measurement forwarded upon application by letter. [31

Superior Trusses, Elastic STOCKINGS, &c., Manufactured by W. H. BAILEY & SON, 418, Oxford Street.
Trusses from 5s. each; Stockings from 4s. 6d. [32

The Original Chlorodyne, Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c.
EARL RUSSELL communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chlorodyne.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chlorodyne engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ½ oz., 1s. 1½d.; 1½ oz., 2s. 9d.; 10 oz., 11s.; 20 oz., 20s.
Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [33

Hall's "Lung Restorer" gives instant relief in Coughs, Asthma, Hoarseness, Sore Throat, &c. Mr. R. Brooke, Mirfield, near Leeds, writes, after suffering over ten years with an asthmatic cough, "Three 1s. 1½d. bottles cured me." Prepared by THOMAS HALL, Chemist, 6, Commercial Street (City side Great Eastern Terminus), London, and sold by all Chemists, in bottles, at 1s. 1½d., 2s. 9d., &c. [34

SEWING MACHINES.

THE FLORENCE
For Family Use is Unequalled.

THE FLORENCE
Hems, Fells, Tucks.

THE FLORENCE
Binds, Braids, Cords, Quilts.

THE FLORENCE
Gathers and Sews on a Ruffle at the same time.

THE FLORENCE
Makes Four Different Stitches.

THE FLORENCE
Has Patent Reversible Feed Motion.

THE FLORENCE
Fastens Off its Seams without Stopping Machine. No other Machine does this.

THE FLORENCE
Received the Highest Premium (Gold Medal) at New York, 1865.

THE FLORENCE
Needle is easily adjusted.

THE FLORENCE
Is almost Noiseless.

THE FLORENCE
Sews across Heavy Seams, and from one to more thicknesses of cloth, without change of Needle or Tension.

THE FLORENCE
Is easily adjusted.

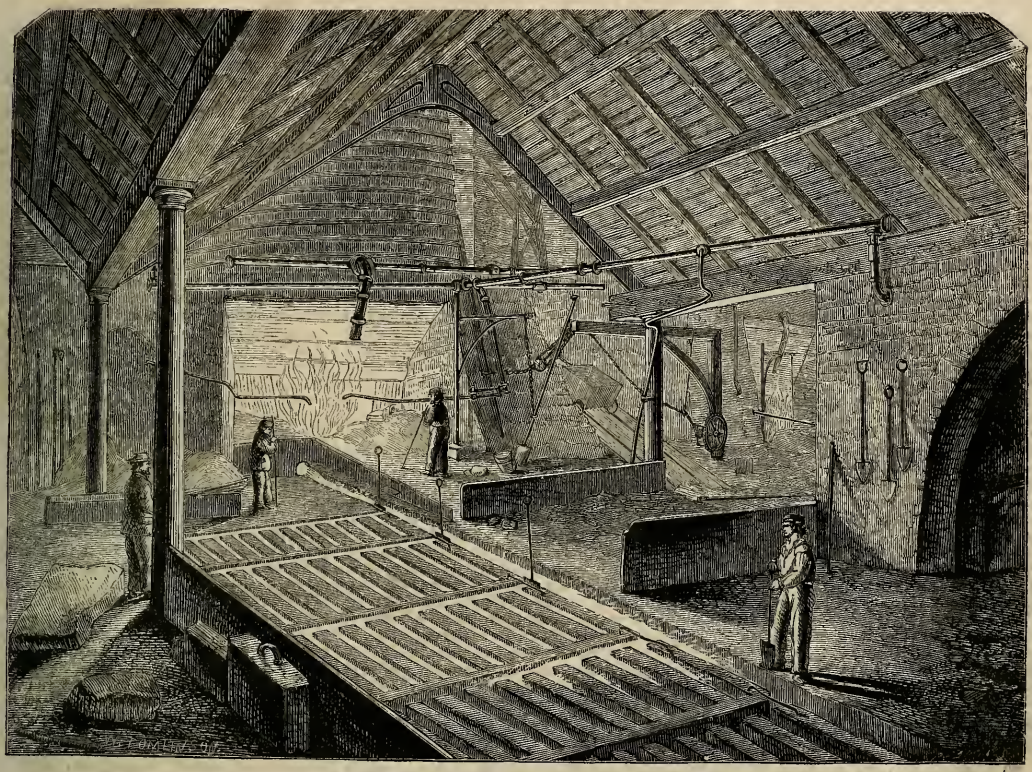
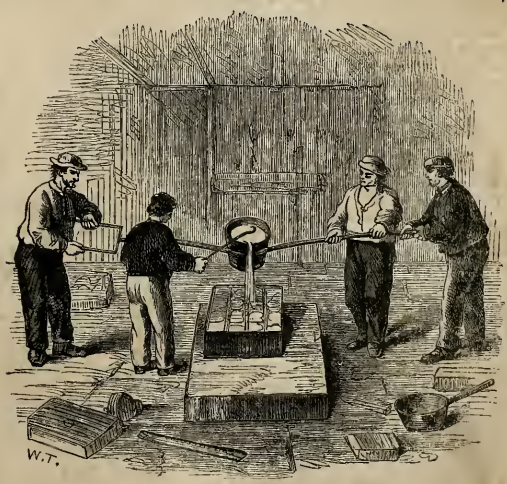
THE DUDLEY IRON WORKS.



INTERIOR OF THE CASTING-HOUSE, WITH LOWER PORTION OF BLAST-FURNACE.

CARRYING ORE TO THE FURNACE-TOP.



CASTING SMALL ARTICLES.

Earl Dudley's Blast-Furnaces, Coneygree, Staffordshire.

The smelting of iron was, until a comparatively recent period, performed exclusively with charcoal as fuel; but so great were the quantities consumed by the furnaces, that in course of time the manufacture began rapidly to decrease, in consequence of the difficulty experienced in obtaining an adequate supply of wood. This caused many persons to turn their attention to the use of pit-coal as a substitute, and in the fifth year of the reign of William and Mary (1694), we find a charter granted to various persons forming a company, who set forth "that they with great study, care, and expence, had brought to practice the use of pit-coal to melt or smelt down all sorts of iron oar, iron stones, slaggs, cinders, and broken, cast, or hammered iron, and to make the same into good merchantable barr iron and other iron," &c. &c. Previous to this, James I. granted patents for the use of pit-coal, but apparently with little result; and the general substitution of this fuel in the place of charcoal was an affair involving a long series of years, much patient labour and perseverance, and numerous failures.

About the year 1730, certain persons created considerable excitement by very loudly-vaunted pretensions to "great and wonderful skill in making iron with ore and pit-coal." They were either arrant quacks, who had obtained a smattering of knowledge concerning such things, or most enthusiastic believers in the ultimate triumph of the new process, for they appealed with the greatest confidence to the public for subscriptions to the trifling amount of a "million of money, to enable these great projectors to make iron sufficient to supply the whole nation, without the use of wood or charcoal."

They obtained some thousands, and for about two years professed to be engaged in successful preliminary operations at Frizington, near Whitehaven, in Cumberland; but having (as they state in a rather bombastic "notice to all lovers of art and ingenuity") "met with none but infidels in that barren part of the kingdom, are lately come to London, and are now getting ready to convince the world," with a view to raising the aforesaid million.

These persons were derided, denounced as impostors, and the successful employment of pit-coal treated with great incredulity; but the necessity for more vigorous efforts towards the providing an efficient fuel in the stead of charcoal soon became obvious to all. So scarce did wood become, that in most counties throughout the country it was forbidden to be cut down for these purposes, and the consequence was the extinction of most of the furnaces. By the year 1740, so severely had the manufacture suffered, that the quantity of iron produced had decreased from 180,000 tons yearly to the insignificant amount of 17,350 tons—of which the county of Stafford, having two furnaces, produced 1,000 tons. Gloucestershire headed the list in that year with 2,850 tons, the product of six furnaces.

From this time pit-coal gradually came into use; the numerous difficulties attending its operation being overcome by various improvements in the construction and height of the blast-furnace, and notably by the eventual production of a blast combining the requisite qualifications of intense strength and steadiness, by the use of steam power. Such is the present blast-furnace.

We have given three illustrations from the works of Earl Dudley at Coneygree, in Staffordshire, near to the town of Dudley.

The modern blast-furnace is a tall, somewhat tapering, cylindrical structure, built externally of brick, and banded at frequent intervals with iron, to strengthen its powers of resistance to the effects of intense heat. Inside it is lined with fire-brick. The height of those we examined was about seventy feet. The front has two openings, through one of which flows at proper intervals the liquid metal, and through the other the "slag" or refuse matter. There are also other openings at the lower part, at each side, and at the back, through which the tuyeres, or pipes carrying the blast, are passed. Each furnace at Coneygree has six tuyeres, and there are smaller pipes carrying water round their extremities, to keep them cool.

The iron ore is procured in great part from the surrounding districts, and brought to the works by canal boat; landed, stacked in large heaps or banks, and calcined previous to being smelted. The furnace is fed at the top, which is reached by a long incline and tramway from a distant part of the works near the landing wharf, as shown in the accompanying engraving. The ore is placed in barrows, whilst others are laden separately with limestone and coal; these are wheeled upon a flat wagon, which is then drawn up the incline by a strong iron chain connected with the steam machinery; and upon arriving at the furnace-top, round which runs a platform, the contents are emptied into the furnace, through openings, in the following order: first coal, then ore, and, lastly, limestone, which is used as a flux. This feeding process goes on without intermission, and the fires are only extinguished when the furnace needs repairs, &c. The materials take about four "turns" in their passage through the furnace—that is, the feeding of to-day would come out in a fused state at the bottom about four days hence. As they gradually descend, the earthy portions of the iron ores combine with the limestone, and form "slag," which, being lighter, rests upon the surface of the liquid metal at the bottom of the furnace, in the "hearth," as it is called. About 150 tons of iron per week are passed through each furnace, and the liquid metal is generally allowed to flow out at the bottom about every twelve hours.

Descending into the casting-house, we take our stand under the roof in front of the furnace, for the purpose of seeing how "pigs" are cast. As we gaze around, the place—orderly enough to the initiated—looks like a sandy wilderness, with an apparently confused jumble of great cranes, masses of iron, pipes running about in all directions, shovels, iron bars, pokers in great variety, &c. &c. It is just previous to casting time, and the fire is roaring and rushing out at the bottom of the furnace with a deafening noise, loud as thunder. The liquid slag flows out from time to time at an opening level with the mass of molten metal, runs down a gutter of its own to a little hollow, where it cools, solidifies, and is then placed upon an iron wagon running up a tramway between the furnaces, and carried to a huge "cinder-bank" a little distance away. All over the floor of the casting-house sand lies to the depth or eight or ten inches. This is now shovelled aside, and beams of wood of the length and shape of the intended "pigs" are laid gridiron fashion upon the floor, in number proportioned to the expected extent of the casting. The sand is next shovelled between all these pieces of wood, pressed in quite hard, and the beams then taken out, thus leaving a series of gutters, or moulds, as shown in the engraving.

A long, principal gutter is formed in the sand from the furnace to the moulds, and the sides of this are carefully smoothed and patted close with a spade, whilst the bottom is made close and even with a wooden instrument resembling a crutch. A man takes his station by the side of the main gutter with a spade in his hand—for a purpose presently to be noted—and all is ready. One of the workmen near the furnace pokes away the sand, &c., from the mouth or hole from which the metal is to issue, until a round, red spot is seen; then an iron bar has its end vigorously driven into the spot, the mouth is opened, and presently out pours the molten metal, glistering, throwing out myriads of fiery sparks, and looking in the daylight exactly like a stream of liquid gold. Away it flows down the furrow to the first row of moulds, which it immediately fills; and the man with the spade now steps forward and sticks his implement across the entrance gutter, to prevent the admission of any more metal to that series. It now flows to the next row, which it fills, and so on, until the whole of the moulds are filled, or there is no more metal forthcoming. This is the pig-iron of commerce.

Our illustration of casting small articles from a ladle, shows one of the operations carried on in another part of the same works; but the iron used does not come direct from the blast-furnace. It has to be re-melted in another furnace previous to being used for such purposes.

Nowhere can iron smelting be seen to greater perfection than in Staffordshire; and at the works of Earl Dudley neither trouble nor expense is spared to ensure perfection.

We have stated that the entire produce of Staffordshire in 1740 was only 1,000 tons. In little more than a century (in 1854) that amount had increased to the enormous aggregate of 847,600.

Getting Married.

"Thinking of getting married, is he, Nelly? Just about the best thing he could think of, supposing he has got the right sort of girl. I hope, though, she will never forget to put the sugar in his tea, through getting excited about her neighbours' doings, and forgetting her husband, like some people I know."

"Beg your pardon, Tom, I'm sure; there's the sugar, and would you like a little more milk, dear? But he is not only thinking about it, but the banns are put up, and the wedding is to come off in a fortnight. And they want our Polly to be one of the bridesmaids, and, if she is, she must have a new bonnet, Tom; so, you see, it concerns you and me, too, after all. Don't you think she is a very pretty girl, and a good one, too—eh, Tom?"

"Our Polly? Of course I do."

"No; I don't mean her, Tom; how stupid you are! I mean Lizzie Wilkins, the girl Charley Crowther is going to marry."

"Yes, Nelly, I think she is a good one; I hope and trust she is. For getting married is a serious thing; and if a man makes a mistake about it, it's pretty nearly ruin to him, body and soul, that's a fact. Bad enough it is with rich folks; but for a working man who means well, and hopes to do his duty in the world, a mistake in that matter is terrible indeed. Always is 'a virtuous woman a crown to her husband;' but never, it seems to me, so bright and so beautiful as when she shares with him the hard task of making the best of matters that require a good deal of making the best of. A working man's home must always be a poor home; but it may be the most pleasant place on the face of the earth to the two people who agree to share it. It is not a store of money that makes folks happy; and when a young woman, who knows how her own father and mother have sometimes been pinched to keep a comfortable home over their heads, and bring up their sons and daughters as good boys and girls should be brought up—how carking care will come, how sorrow sits at the threshold of every man's house; how evil days threaten, guard against them as we may—the young woman, I say, who, knowing all this, gives herself to a man to be his helpmeet, to walk with him, hand-in-hand, through the paths of life till death do them part, and who, with simple faith in his manly truth, looking to him as the breadwinner whose industry will carve out a future for them both, the protector whose strong arm clasps her to his heart and holds her there—resolves to be to him a wife indeed, the tenderer half of their united being—there is a girl worth a man's winning and wearing."

"I don't know how it is, Tom, but you always seem to see a deeper meaning in common things than I do, or than anybody else that I know does. I have sometimes thought that you spend more time than you ought to do over those books of yours; not that you ever neglect anything else for them, I don't mean that; but it seems as if they made you too clever for a man in your position. But you are right, Tom; and I feel that you are, for you seem to be able to put into words what I often think of in a dreaming sort of way, but cannot quite get into shape, and what the people we meet with seem to have very little idea of. Now, Mrs. Wilkins, Lizzie's mother, you know, looked in this afternoon, and so did two or three others, and they were all talking about the wedding; and they all said that it was a good match, for Charley is earning at least two pounds a week, and has something laid by, and Lizzie is careful, and good at housework and needlework, and they did not see why he should not be a foreman some day, and then Lizzie would be able to hold up her head as high as any of them. They have taken the house—it has four rooms and a kitchen—and furnished it, with a Kidderminster carpet in the front parlour, and six horsehair chairs and a couch, with an anti-macassar, and 'Red Riding Hood' in a frame, and a glass, which cost two pound ten at a sale, on the mantelpiece. And there's an iron Arabian bedstead, and four bedroom chairs at four and sixpence each, and a marble top wash-stand and a chest of drawers, picked up cheap, but never made under four guineas—and everything comfortable; and the kitchen's quite a picture. So you see, Tom, Mrs. Wilkins and Lizzie herself are all in high feather, and looking forward to the housekeep-

ing. But they were in a great trouble about one or two little matters. One was Lizzie's bonnet; and next, what would be the most genteel thing to have for dinner on the wedding-day. Mr. Wilkins, Lizzie's father, says he is for a good old-fashioned leg of pork, and just an apple pudding after; but Mrs. Wilkins says she does not think a goose would be out of the way on such an occasion. And then, Tom, they can't make up their minds about the cabs to church. Young Harry Wilkins, Lizzie's brother, says the bride and bridegroom ought to ride together in a Hansom; while Mrs. Wilkins thinks the neighbours might say it was proud of them, and it might make words afterwards. But, Tom, these seem to me to be very little troubles, and you make me think still less of them. You and I walked very quietly to church; and Tom, dear, though we have been together for seventeen years, I would marry you to-morrow if we had the chance again."

"Would you, indeed, Nelly? I suppose I must take that as a compliment. And I sincerely hope—and I don't fear that I shall be disappointed—that in seventeen years' time Lizzie will be able to say the same to Charley. The young couple have a fair start; and whether they go to church afoot or in a cab, whether cane-bottomed chairs and white dimity adorn the new home, or horsehair and polished mahogany, will not much affect their future happiness if, in furnishing their house, they have not failed to provide two good, loving, courageous hearts, which will overcome a thousand little troubles; cheerfulness, good temper, mutual trust, and that calm, deep-seated love which makes them sweethearts all their lives, and gives a deeper meaning to the best of all titles—father and mother. So, I will be among the first to shake hands with the happy couple; and you, Nelly, shall give Lizzie a kiss for me, and tell her how I welcome her to the honourable estate of wife."

*How the Rate of Wages may be Raised.**

BY ARTHUR HOUSTON, M.A.,

Whately Professor of Political Economy in the University of Dublin.

Supposing the demand for labour to be increased in the way mentioned in our last article—namely, by an augmentation of the capital of the country—whether the value of labour will rise depends on whether the supply is or is not increased in a like proportion. It would be to no purpose, as far as the value of labour is concerned, to double the capital if at the same time the number of labourers, or the duration of their labour, or the amount of exertion they put forth in a given time, were doubled also. In such a case the value of labour would remain unaltered.

And here it is proper to notice a distinction which is of importance to the right understanding of this subject—that, namely, which exists between the *Rate of Wages* and the *Value of Labour:* the latter being the amount of money—or, more properly speaking, goods—which the workman receives in return for a certain amount of exertion, whatever be the time he takes to put forth that amount of exertion; the former being the amount which he receives in return for the exertion he puts forth in a given time, whatever be the amount of exertion which in that time he puts forth. Thus, the labour of a lazy man, or a weak man, may be dear at fifteen shillings a week; while, in the same employment, that of a strong and active man may be cheap at thirty. The wages of the former are low compared with those of the latter, but the value of his labour, on the contrary, is high.

It is necessary to bear this distinction in mind, because the effect on the condition of the working classes produced by an alteration in the supply of labour is different according as it is brought about by an alteration in one rather than another of the three elements of which that supply consists. If the number of labourers be altered—the demand for labour being supposed to remain unchanged—*both* the value of labour and the *rate of wages* would be altered; but if either the duration of the period of labour or the amount of exertion put forth in a given time be altered, the value of labour alone will undergo any change, while the rate of wages will remain unaffected. To take an example: Suppose the amount of capital in a country appropriated to the payment of wages to be £20,000,000, the number of labourers to be 1,000,000, and the number of hours' labour per day to be 10. Under these circumstances, the average wages earned by a man in the period during which on the average the capital was turned, would be £20. Now, suppose that, by emigration, for instance, the number of labourers were reduced by one-half, while the number of hours' labour per day, and the amount of exertion put forth in that time, remained as before. It is plain that only one-half the previous amount of work would be done; and, since as much capital would be spent in wages as ever, it follows that each labourer would receive twice as much wages as formerly, without doing any more work; so that the rate of wages and the value of labour would be doubled simultaneously. But suppose, on the other hand, that the hours of labour, or the amount of exertion put forth in a given time, were reduced one-half, while all the other circumstances originally mentioned remained unchanged; here the amount of work done would be diminished one-half, and as the £20,000,000 would still continue to be paid for it, the value of labour would be doubled; but inasmuch as the number of persons among whom this sum was divided would still be 1,000,000, the rate of their wages would remain unchanged. They would not receive more, but they would work less.

Such would be the effects of a decrease in the supply of labour, unaccompanied by a corresponding decrease in the demand for it—that is to say, in the capital of the country. But it is only on the supposition that such a decrease of capital would not follow a decrease in the supply of labour that we are entitled to expect a rise in wages, or in the value of labour; and it so happens that this very rise of wages and of the value of labour have, in general, a tendency to bring about, as an ulterior result, a diminution in the capital of the country; so that it is possible that, after enjoying for a period a higher rate of remuneration, regard being had to the amount of work done, than previously, the working classes might find that rate reduced to its original level. This result would follow from the fact that every addition to the cost of labour involves a corresponding deduction from the rate of profit; and, as the quantity of capital accumulated and invested depends, in a great measure, on the amount of profit which the investment of a certain amount of capital may be expected to yield, the rise in the value of labour, by diminishing the rate of profit, tends to diminish the capital of the country, and so, in turn, to reduce the value of labour.* It should be observed that these propositions as to the effect of an increase in the value of labour on the accumulation of capital, are not put absolutely, as though such a result were inevitable, but merely as possible and not unlikely consequences. It may happen that the instinct of accumulation is so strong in a country that the rate of profit there will bear a very considerable reduction, without occasioning any decline in the capital; and, if so, the rise in the value of labour which produced the fall in the rate of profit will be permanent.

Supposing this to be the case, it is clear that any circumstance which has the effect of diminishing or preventing the increase of population must tend to raise the rate of wages, since the larger the population, the greater the number of labourers. It would be vain to attempt to conceal that this lands us upon one of the most debatable—or, at least, debated—spots of ground in the whole science of Political Economy—the Malthusian doctrine of Population. Whether it is right or politic to endeavour to restrain the limits of population by encouraging men to emigrate, or to exercise those prudential restraints which Malthus pointed out as the means to be employed for the purpose, is a question I shall not here venture to argue. I shall content myself with having pointed out the effect which diminished competition for employment, arising from a decreasing population, produces on the earnings of the working classes, and leave them to judge whether this be a sufficient motive to act as such a result would seem to dictate. I cannot, however, conclude this article without mentioning that it is not alone by augmenting the money-wages of the labourer that a diminution in the number of the labouring classes improves their position, but by cheapening the articles on which most of the wages they earn are expended. The greater part of the things consumed by the working classes consist of raw or slightly manufactured produce; most of it raised in the country where the consumers live, because such commodities are too bulky to be imported from a distance. Now, it is one of the universal truths of Political Economy, that the more produce is extracted from the ground in any year, the more will it cost to raise any given portion of it, unless improved processes of manufacture are adopted in raising the larger supply. For example, the greater the number of quarters of corn grown on a farm, the greater the average cost of growing each quarter. It follows from this, that as the population of a country advances, and requires annually a greater quantity of the necessaries of life, the more costly these things tend to become, and *do* become, unless the progress of agricultural skill and knowledge counteract this tendency. And, on the contrary, every check to the growth of population acts in quite an opposite way, rendering the necessaries of life less costly than they would otherwise have been. Thus, then, it appears that a diminution in the numbers of the labouring classes, causes a double improvement in their condition, enabling them to earn more money, and to obtain in exchange for any sum they may have to spend more of those things they most want.

* Continued from page 218.

* This point has been already elucidated more fully in a former chapter

A SHOEMAKER NATURALIST.

A few weeks since Mr. Thomas Edward was elected an Associate of the Linnæan Society of London. The *Banffshire Journal* says Mr. Edward is a journeyman shoemaker, whose researches have been rewarded by the discovery of something like thirty new species. These consist of annelids, tunicate mollusca, sponges, shrimps, and other smaller species of crustacea. Besides redeeming one from oblivion, he has also brought to light two entirely new specimens of fish. Mr. Edward's devotion to his favourite pursuit at one time seriously endangered his health. It was his custom, for nearly five successive years—from 1840 to 1845—to spend most of the nights in the open air. Indeed, he might, during that period, be truly said never to have been in bed save a small portion of the first and last days of the week. It was his daily practice, on returning from his work at night—and shoemakers (which trade Mr. E. still follows) then worked from 6 a.m. to 9 p.m.—to bundle on his collecting apparatus while he was taking his supper, and start with a portion of his meal in his hand. His "collecting apparatus" comprised insect boxes and bottles, and he had usually a botanical book, and, besides all, a gun. So accoutred, he scoured the country, or as much of it as he could before darkness compelled a pause. When he could no longer "observe," he dropped down by the side of a stone, or dyke, or ditch, or tree, whichever came handiest. Here he lay, or sat, or slept, as the case might be, till daybreak enabled him to resume his searches, which were continued till he had to return to his daily labour. It was no unusual circumstance, when he had wandered too far, and met with a more than usually attractive spot, that he would strip himself of his gear, gun and all, which he would hide, and thus lightened of everything, save his specimens, would take to his heels, and run at top speed, to be at his work at the proper time. Weather never daunted him; and his neighbours used to say, "It was a stormy night that kept that man in the house."

*The Mechanical Part of a Prize Essay.**

The young writer of whom we have spoken acted upon the various rules given by us, and soon had the satisfaction of finding his essays all successful. There is reason to believe they all had special merits. There were seventy-nine competitors, and when the essays were printed they could all see them and judge accordingly. These would be sharp-eyed and interested critics; but they generally admitted that the essays were as good as theirs, and some even owned that they were better; so that their success did not depend upon the writing, but upon their intrinsic merits, which should always be the case; but their chances of being well read and well judged were undoubtedly promoted by the perspicuity of the caligraphy. When the judges met and found, as was the case, that there were

* Concluded from page 262.

nearly three hundred separate manuscripts to look over, the first thing they naturally did was to select those which were the most plainly written, and required the least time to read; and it proved that those of the young man of whom we have spoken were among the plainest. The consequence was, they were read first and read oftenest; and, as they had merit, that merit became well understood. Everybody who reflects must see that this would be the case. Those gentlemen who undertake to be adjudicators have a very onerous task before them, requiring days of patience and labour. Weariness must be occasioned by the perusal of many piles of manuscript. It is not only a great service, but a great favour, when gentlemen of high character and position, and of many engagements, consent to perform this labour for the sake of advancing the interests of public knowledge, and for the encouragement of young writers; and whatever mechanical care essayists can take in rendering their writing plain and clear, diminishes the labour and saves the time of those who generously perform this gratuitous work.

If the reader ever sat in an editorial room, he has seen the immense amount of labour which has to be performed in the perusal of fifty or a hundred letters, which arrive in the course of a day—some written in a small hand, in an obscure way, in crowded lines, on both sides of the paper, with the tops of the tall letters running into the tails of the letters of the upper lines; on blue paper, and in pale ink—and he can well imagine how the eye must ache before all these elfin characters are made out. The negro "drovier" could count all his pigs except the one which skipped about, and no less the words of doubtful meaning, which skip about a letter, give more trouble to count than all the others. With the best intention, and the greatest desire to consult the wishes of the correspondents, the most laborious editor must, from sheer exhaustion, now and then lay aside letters from this cause, and many valuable thoughts and suggestions thus become lost to the public. Writers who think of this will readily own that a few hints on such a subject, in connection with Prize Essays, are relevant, and may be useful.

In these remarks we have set no hard task to any young writer. The mere mechanical operation of writing plainly is within the power of every one who gives the matter a thought; and in any case where there is not time, or it is too much trouble, to re-model the handwriting, it is easy to have the essay, when composed, copied out by some person who writes a plain hand. Lest we should discourage any one, we repeat that by good writing we do not mean grand writing. The plainest, simplest hand that can be easily read, is good writing. Adjudicators do not want grand writing, but plain writing; and every person who can write at all, can write plainly if he thinks of it, and takes care. Indeed, the hand of every person who can write would be rendered plain by the mere mechanical arrangement of writing the words clearly apart from each other; keeping a good space between the sentences; using ruled paper; having the lines tolerably wide apart; keeping a good margin on each page; writing only on one side; using black ink and white paper. These rules a child might observe. They are rules that gentlemen often neglect; but the observance of which will give every writer of a prize essay one important chance of success. The music of Handel would be lost if executed so that it could not be heard. Demosthenes would have composed his great orations in vain had he not delivered them with a distinct articulation. The wisest thoughts that were ever expressed would be written to no purpose unless they could be read. And this is the moral of our story.

*Coining Dies.**

An arduous operation remains to be performed before the matrices are practically available for their destined purpose—it is that of hardening them. It is also a hazardous one, for the steel may, after all, "fly" or fracture in the process, and the artist's labour will, in such case, prove to have been labour in vain. There is no evading the business. In their present soft state, the matrices, though very beautiful as works of art, are simply useless, and they must pass through fire and water to their high destiny. The engraver's hope lies in the excellent character of the metal, and the practical knowledge and great care of the die-hardener. For the preservation of the delicate

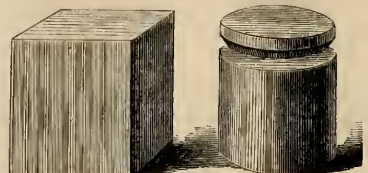


Fig. 1. Fig. 2.

lines of the engravings, especial means are taken. The surfaces are covered with a paste composed of lamp-black and oil, which forms a mask or protection to the devices. Rings of iron are also shrunk upon the circumferences of the embryo dies, to prevent their excessive expansion and possible fracture whilst in the furnace.

Once again they are now placed in an iron pot, smothered in charcoal, and put into a furnace. An hour's heating suffices; they are then with-

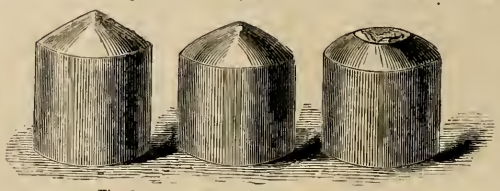

Fig. 3. Fig. 4. Fig. 5.

drawn and plunged sharply, by aid of tongs, into a cistern of cold water. This is the critical moment of their existence. If no unusual sound—no singing noise—is heard, all is well; if, on the contrary, either die is musically inclined, its song will be found to proceed from a mouth, or fissure, in the metal, and the engraver's heart will fail him, for he then knows that his work is spoilt. This latter contingency seldom happens at the Mint, fortunately, and that from the causes

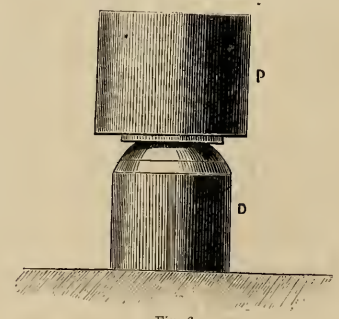

Fig. 6.

named—good steel and careful workmanship. Allowing that all has resulted satisfactorily, the masks are removed, and the *matrices* handed to the polisher, who, by pressing them against a running disc, quickly gives their "tables," or flat surfaces, a mirror-like brightness. They are next tempered—that is to say, reduced from their state of extreme hardness to one of toughness and moderate hardness. This is effected by placing

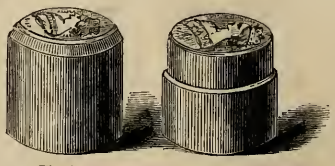

Fig. 7. Fig. 8.

them on a red-hot bar of iron, bringing them to a pale straw-colour, and then plunging them again into cold water. The matrices are now perfect. In the meantime, two other blocks of steel have been prepared, by means of forge and lathe, and are waiting to be dealt with. The face of each of these has been turned to a flatly-conical form, and both are as soft as annealing can make them. This prepares them for the press—a massive implement, through the centre of which passes a coarse-threaded screw of six inches diameter, weighted by two heavy iron arms of six feet in length.

To the lower end of this screw one of the matrices is attached, with its engraved surface downward, and below it stands one of the recently-prepared steel blocks, with its conical face looking upward. All being now ready, several workmen seize the fly arms, and, walking round with them, raise both screw and matrix several inches. Suddenly they release their hold, and the weighted arms of the press revolving with speed and force, drive down the matrix until it impinges with a dull, heavy thud upon the softened block of steel. Again the screw and matrix are raised in a similar manner, and the depressed apex of the cone-topped die upon which the latter struck, bears witness to the effects of the impact. In truth, a partial impression in relief has been transferred from the matrix to the nether block. This has, however, become hardened by the blow, and must have another annealing ere it can be made to take a complete copy of the engraving. This effected, it is once more placed on the bed of the press, the matrix disengaged from the screw being carefully fitted upon it. A blank disc of steel now takes the former position of the matrix; the fly-arms are raised and released as before; and, gathering momentum as the press-screw revolves, the hammer-block falls heavily upon the matrix. The effect of this second blow is to make the transfer as perfect as is that of a seal upon molten wax, and the lower die becomes what is termed a puncheon. The second matrix and block are treated in a manner precisely similar, and thus is obtained another puncheon—the first representing the obverse, and the second the reverse of the florin. These are afterwards hardened and tempered, and thus prepared for their arduous task—the multiplication of coining dies *ad libitum*. The matrices, having accomplished *theirs*, are placed on the shelf.

Bars of cast steel for florin dies are about 10 ft. long, $1\frac{3}{4}$ in. broad, and $1\frac{1}{4}$ in. in thickness, and upon these the smith is the first operator. They are heated to redness, and cut into short pieces $1\frac{3}{4}$ in. long; in this form, therefore, they resemble Fig. 1. Hammering in a semicircular swage converts them speedily into a cylindrical shape, and then, to prepare them for the next process, the ends are cut off, and this is seen partially effected in Fig. 2. Thus the smith proceeds until say a hundred blocks are so far advanced, and then the cutting and coning-up, as shown in Fig. 3, are accomplished. The annealing furnace is their next destination, and a very gradual cooling afterwards among the ashes and embers of the furnace, leaves them ready for the turning-shop. There they are first "topped," which means that one end of each is turned bright and conical, as indicated by Fig. 4. Now they are prepared for the multiplying press, which resembles closely that already referred to, and to the screw of which a puncheon is affixed. One by one the turned blocks receive, by force of pressure, imperfect copies of the puncheon, and in this stage Fig. 5 will convey a good idea of their real appearance. Another annealing follows, and then a second series of blows administered to the puncheon, represented by P in Fig. 6 as resting upon the block or die, D, perfects the impression, and reproduces, in fact, a faithful copy of the original matrix. This may be said of both obverse and reverse, but the former only is given by way of illustration in Fig. 7.

Thus it will be understood that, by sheer mechanical force, a hundred *fac-similes* of the engraver's original dies have been obtained, and that, at the Mint, thousands of them are produced in the same way. This remark applies to coining-dies of every kind, although it has been found convenient to speak only of those intended for the stamping of florins.

The superfluous metal around the engraving is removed in the lathe, and the die is brought to its gauged diameter by the same agency, when it

* Concluded from page 261.

takes the form of Fig. 8. Now it is ready, therefore, after hardening, polishing, and tempering, for transference to the coining-press room, and the imprinting of twenty or thirty thousand discs of metal with florin devices, by which time it will become "old steel," and unfit for further duty.

The power of multiplying dies will be recognised as of great value to the Mint, as the engraver is only required to engrave one pair of dies for each denomination of coin. If a puncheon fails, it is easy to produce another from the matrix; while, if the matrix should break down, one of the impressed dies may be used in its stead. Puncheons, as a rule, however, last for many years, and are the parents of tens of thousands of dies. Since the Queen came to the throne, not less than 100,000,000 of sovereigns have been struck at the Royal Mint; and the dies used in the accomplishment of the work owe their existence to two pairs of puncheons only! This statement will convey a clear idea of the great economy of the system of die manufacture by the process of multiplication. In the production of medal dies the mode of procedure is very similar; but from the bold relief of the devices, many more annealings and many more blows of the press are necessary to make their impressions perfect.

Electrotyping.

Bunsen's Battery.—This, like Daniell's, is a constant battery. It is composed of a cylinder of amalgamated zinc, z (see Fig. 1), placed in an earthenware or glass vessel, v, containing diluted sulphuric acid. This cylinder surrounds a porous vessel, P, which contains a cylinder of carbon, c, dipping into nitric acid. To the upper portion of

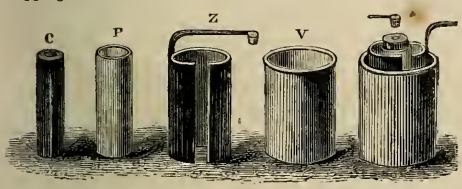

Fig. 1.

the zinc a strip of copper is soldered, the conical extremity of which fits tightly into an aperture pierced in the upper portion of the carbon of the adjoining element. By these means communication with one element and another is established.

The negative pole is always at the extremity of the pile terminated by the zinc; the positive pole at the other extremity.

The best proportions of water and sulphuric acid to employ to form the acidulated water in which the zinc is immersed are one part acid to nine parts water. The nitric acid surrounding the carbon must be concentrated, but not fuming.

Smee's Battery.—This form of constant battery is mostly employed in the production and duplicating of copper plates. The voltaic couple consists of a plate of platinised silver placed between two surfaces of amalgamated zinc. The silver communicates by a wire with the positive pole of the decomposing apparatus, or the *anode*, which must be of equal surface with the mould. The zinc is connected by a wire, fastened by a screw to the mould placed at the negative pole of the decomposing apparatus. The voltaic apparatus must be charged with sulphuric acid diluted with fifteen or sixteen times its weight of water.

The decomposing apparatus may be either vertical or horizontal. If the latter, the mould must be placed at the bottom, else the deposit of copper will not be of uniform hardness. The vertical form is considered best for slow deposit; the horizontal is more appropriate for a rapid deposit of copper.

When the apparatus is filled with liquid, take a piece of copper of the same dimensions as the plate to be moulded or copied, and put it in communication with the silver of the battery. The battery being charged, the vessel filled with the solution, and the piece of copper to be dissolved (anode) being immersed in the solution and connected with the silver of the battery, the wire which is soldered to the plate or mould on which the deposit is to be made is put into communication with the zinc of the battery; and the operator must take especial care not to immerse this plate or mould into the solution until the last thing, in order to complete the circuit with it. These arrangements being properly made,

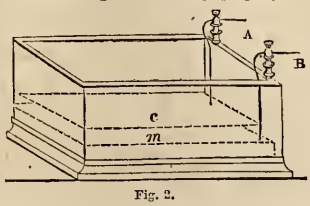

Fig. 2.

we see a deposit of pure copper formed, which does not adhere to the original plate, on account of the film of air which separates them, or the very thin coating of wax with which the plate has been previously rubbed. In the engraving, *m* is the anode, connecting with the silver by the wire B; c is the mould on which the copper is deposited, connecting with the zinc by the wire A.

Definition of the Electric Current.—When the opposite poles of an electric pile are connected by a good conductor—as a copper wire, for example, the electricities are set in motion in the wire. The positive electricity passes from the positive to the negative pole, the negative electricity travels in the opposite direction. It will be perceived that there are two currents of electricity. To designate the direction in which they travel, it is only necessary simply to indicate the path the positive electricity takes; it being understood that the negative electricity takes the opposite direction. For example, if a wire, A B (see Fig. 2), has its extremity A in communication with the positive pole of a battery, and its extremity B in communication with the negative pole, we say that the current in the wire goes from A to B; but in speaking thus it must not be forgotten that we are naming the direction in which the positive fluid travels, and that we tacitly proclaim that the negative fluid travels in the opposite direction. The current which circulates when the poles are in communication persists as long as this communication continues established. There is a constant flow of electricity which can be disposed of for various purposes.

Chemical effects of the Battery.—If we attach a metallic wire to one of the poles, and a second wire to the other pole, and then immerse these two conductors (electrodes) in a saline solution—sulphate of copper, for example—taking care that the wires do not touch, we perceive that the metal of the salt in solution becomes deposited upon the negative electrode: the other elements of the salt go to the positive electrode.

The same experiment performed upon an alkaline, or earthy salt, placed in solution in a U tube, gives the alkali at the negative pole, and the acid at the positive pole.

From this it appears that the salts do not all behave in the same manner under the influence of the electric current; but the difference in the results observed is not due to a difference in the action of the current: it arises from the oxidisability of the alkaline and earthy metals, which, upon their arrival at the negative pole, decompose the water and become oxidised, with a disengagement of hydrogen.

The Baths.—The apparatus by the aid of which we may decompose the various metallic combinations employed in electrotyping having been described, we proceed to give some details upon the combinations themselves.

Copper Baths.—The sulphate, chlorate, nitrate, and acetate, are the combinations employed, especially the sulphate, on account of its cheapness. This salt presents a considerable resistance to the passage of the electric current, and the conducting power of the solution may be increased by adding to it a small quantity of sulphuric or nitric acid. A solution containing 1 lb. of sulphate of copper in three and a half pints of water, and one-third to one-half of its volume of sulphuric acid, diluted with eight parts of water, forms a good working bath, especially when operating with non-conducting substances, coated with plumbago.

The soluble electrode is always in copper: the mould may be formed of plumbago, carbon, gold, silver, platina, nickel, as well as of copper.

The discoverers of electrotyping are of opinion that it is always objectionable to employ an acid bath, yet many persons prefer it. The nitrate, chloride, and other soluble salts of copper, present no advantages over the sulphate.

Silver Baths.—The choice of the silver salt to be employed depends upon the nature of the mould, which may be gold, platinum, silver, copper, carbon, or a plastic substance covered with one of these substances. Sulphate of silver answers very well for metals which have more affinity for oxygen than silver. Of all the salts that can be employed, the nitrate of silver is the least suitable. The following is the composition of the silver bath now generally adopted:—Dissolve 2 lb. of silver in 6 lb. of nitric acid, and gently evaporate the solution over a spirit lamp, until the resulting nitrate is fused. By this means we drive off not only the excess of acid, but also reduce the copper that may be present. Then dissolve the nitrate in a gallon of water. Then, in another vessel, dissolve 4 lb. of cyanide of potassium, and add the solution gradually to the silver solution: cyanide of silver is precipitated, and the nitrate of potassa formed remains in solution.

This operation, conducted with care, up to the moment when the addition of a small quantity of cyanide no longer causes a precipitate, admits of the removal of the nitrate of potassa in solution by decantation. The precipitate remaining in the vessel is washed in pure water, and immediately dissolved in 4 lb. of cyanide of potassium. Then sufficient water is added to make up ten gallons. This bath is not immediately ready for use. Before it will yield a good deposit it must be mixed with an equal quantity of an old bath; or, to impart to it the qualities of an old bath, it must be boiled for several hours; or, which is more to be depended upon, 2 lb. of yellow prussiate of potash is added to every 4 lb. of silver. But this last composition of the bath, although most generally employed, is not adapted for brilliant silvering.

Gold Baths.—Gilding may be done either hot or cold: the composition of the bath is the same in each case; only warm gilding is generally richer in colour, and is usually adopted where the baths can be heated by steam.

The bath is formed of the double cyanide of gold and potassium, dissolved in an excess of potassium. To prepare it, dissolve 2 oz. of gold in *aqua regia;* evaporate it to a syrupy consistence; re-dissolve it in warm water, and add, little by little, 2 lb. of cyanide of potassium, previously dissolved in water, and thus form 11 gallons of bath. It is best to boil it several hours before employing it. The most suitable temperature for operating is 160° Fahr.

* Continued from page 260.

ENGLAND'S HEROES.

Old England has warriors plenty,
And heroes who guard her still,
Who fight for her peace and glory,
Who battle through good and ill;
And mightier triumphs they win her,
These heroes and soldiers true,
Than ever she won with her legions,
At Alma or Waterloo.

Shall he have no place of honour,
No laurels to deck his brow,
Who fights in the ranks of progress,
Who battles with spade and plough?
Shall he have no word of welcome,
Who struggles with heart and brain,
To grapple the wrongs and evils,
That smite us again and again?

Who faces a superstition,
Who preaches an error down,
Is he less worthy of honour,
Less worthy a hero-crown,
Than he who from fields of slaughter,
And red with a brother's gore,
Comes welcomed by trump and banner,
And thunders that shake the shore?

The heroes whom we would worship,
The heroes we would embrace,
Are they who have toiled and suffered,
And planned for the human race;
Who knock at the hearts of the people,
And fill them with faith and love,
Who shed on our night of darkness
A gleam of the light above.

Matthias Barr.

THE NEW FACTORY ACT.

The factory inspectors report most favourably of the first year's working of the Act of 1864, placing under the Factory Act regulations several manufactures which till then had been a law to themselves. Some master potters, indeed, are desirous that "full time" should begin at an earlier age than the Act will allow; but, says Mr. Baker, "I have seen so many masters recant their objections to the Factory Act system. There are some few who, even in this trade, in which art is everything, do not seem to appreciate thoroughly the value of an educated class of artisans." Young hands may be scarce at pottery wages; coal and iron works compete more and more for them every year; but immigration is taking place to some extent, and machinery is likely to be adopted more rapidly than was anticipated. The old system, with its reckless expenditure of life and disregard of morals, will give place to a more extended and less costly method of production. There is, already, a visible improvement in workrooms. The Act has the effect of making more regularity necessary. Mr. Campbell, of the firm of Minton and Co., states that the quality of their ware has been improved; they have less spoilt ware since the greater regularity of work has put a stop to hurried production. Masters find that the men come earlier and lose less time, and as much work is produced as before. Mr. Baker hopes that we are on the eve of a great sanitary improvement in the Potteries. The workshops, in which 28,000 artisans are employed, have been whitewashed and cleansed, which, in some instances, had not been done for twenty years; the means of ventilation have been greatly multiplied, the hours of child labour have been diminished without diminishing production; 1,600 children—most of them never at day-school before—have been placed in good schools, where they sit side by side with children of the upper working classes and of tradesmen; and the effect is seen in the altered tone of conversation in the workshop, in in greater tractability, more cleanliness, less precociousness, streets quieter at unseasonable hours, and homes with more of domestic enjoyment. Masters are stirred up to make improvements as the workers become more respectable. Stoves are being ventilated, and the heated chamber cut off from the workshop, and this with a great economy of fuel. So in the manufacture of lucifer matches, of which such sad disclosures were made, we are told of a firm who have the dipping of the matches, the most unhealthy part of the employment, done by machinery. Here again some manufacturers complain of the limitation of the hours of work, and the consequent hindrance; but, as a sub-inspector says, "there's a certain amount of work in a person, and when that's out it's all he can do;" and were it otherwise, children should not be subjected to an amount of labour which destroys their health and strength. Of the percussion-cap manufacturers, one of the largest manufacturers at Birmingham says that the cap-fillers earn as good wages and do as much work as before, and all are away at 6 p.m., instead of being kept late at night from the desultory manner in which the work used to be done. He observes a great improvement. Paper-stainers also declare that they find no decrease of production, and this without additional hands being employed; the work is done with more energy than when the hours were irregular and unrestricted. "The young folks are not so weary as with the former long hours, and more work is produced in the same time." The fustian cutters, also, with factory hours cut as much as they were ever required to do; "the hands stick at work, knowing they will have to give over at a certain hour." "The character of the trade is raised." The prices of the work have been raised greatly; the earnings of a fustian cutter used to be the earnings of a child, as child and man had the same amount of daily labour; but, under the new Act, the child is forbidden to work until fully equal to it, and the man earns a fair day's wages. Unfortunately, the Act applies only to work for hire, and parents may work their own children, therefore, as long as they please; young workers go home from the factory when it closes, to be compelled to work for their parents. But the result of the Act is nothing but a series of gains. It is true that children, prohibited from working full time in these manufactures, may be, and are, sent by their parents to other employments not less injurious, where they may work full time; but Parliament will, before long, consider the condition of these trades also. Three or four firms in Birmingham, engaged in manufactures reported upon but not yet made the subject of legislation, have already, in anticipation of it, begun to work Factory Act hours. Mr. Baker gives the following, as the result of his long knowledge of factory life:—"Commerce seems to be growing faster than the population, and as the power of wages strengthens, we may be certain of what the result will be without the controlling influence of education. My belief is, that factory labour may be as pure, and as excellent, and as obedient as domestic labour, and perhaps more so, where the master wills a discipline, and enforces it. I have known many such examples."

Of the 1,285,000,000 people now in the world, 700,000,000 wear cotton exclusively, and all but 70,000,000 use it more or less.

*How Working Men's Clubs and Institutes Sometimes Fail.**

BY THE REV. H. SOLLY.

The next case of failure we may look into occurred in the town of B——, where a Club and Institute was commenced under very favourable auspices, and on rather a large scale.

The movement was inaugurated in the year 1863, by a large and enthusiastic public meeting, at which the Mayor presided. It was addressed by several influential inhabitants, by working men, and by myself. A good provisional committee was appointed, and premises were soon engaged, which, on the whole, appeared tolerably well suited for the object—the best, in fact, to be had, though by no means perfect. They consisted of a large hall and gallery, capable of seating at least 1,000 people, and three or four club-rooms partly formed out of one end of the gallery by wooden partitions.

A large number of members were soon enrolled, and for a time everything looked most prosperous; but, unhappily, the same fatal mistake was committed here, as in the last case, of having two Committees. In the spring of 1864, I heard of these two bodies having come into collision on the question of Dramatic Entertainments, and was shortly afterwards invited to go down and discuss the state of affairs. This I did, and also attended another meeting about a year after the Club had closed, with a view to its re-organisation. On this last occasion, the causes of its downfall were very fully gone into, and I will now give the views of its chief supporters, as then expressed, reserving any comments I may have to offer till the end.

"The first difference of opinion that arose between the two Committees was in regard to keeping the Club open on Sundays; but that was amicably settled after some discussion, it being unanimously agreed that it should be open for a limited number of hours; that the newspapers should be withdrawn, but the periodicals left. The heavy rent, however (£100 per annum), soon began to tell against the Club. It was more than the Club could properly bear. Then a great mistake was made in admitting members as young as sixteen years. The premises, also, were not suitable. It was a great error having two Committees, but might not the same difficulties have arisen with Trustees? The worst part, however, was that the Elocution Class became a Dramatic Class, and then regular Dramatic entertainments, with scenery and dresses, were introduced, not at good long intervals—which would have done no harm—but once a week. After this, the whole life of the Club seemed swallowed up in these entertainments; couldn't keep up any Classes—not even the Discussion Class, or any other sort of entertainments. After a time, the dramatic entertainments themselves became disreputable, little better than a 'Penny gaff.'

"No doubt we did wrong in having two committees, but we didn't know any better. The general (gentlemen's) committee decided against the Dramatic entertainments, and then the break-up began. The gentlemen ultimately withdrew, and gave up the Club entirely to the other committee, who tried to carry it on for a time; but the chief part of the working men had left by this time, and though the dramatic performances were often crowded, the Committee soon found they couldn't meet their rent, and the whole thing was given up."

"The lad who sat at the door to look at the tickets as members came in, was only fourteen years old. Saw hundreds of lads admitted without their ever being questioned as to their age; and even many young girls." (This last, I think, must refer to the entertainment nights.) Various other remarks were made; but the foregoing sufficiently represent the general tenor of the discussion.

Comment.—As to the double Committee and the first founders of the Club "not knowing better," that was clearly their own fault (as in the previous case at S——), in not asking us what experience had taught us on the subject. It is the special function of our Society to collect this experience, and many of the failures that have taken place might, probably, have been avoided if the promoters had sent me a copy of their proposed Rules before finally passing them, or otherwise consulted us. Let me take this opportunity of saying how gladly I should at any time give the best advice in my power in regard to the Rules of Working Men's Clubs and Institutes.

The same remark applies to the early age named in the Rules of this Club for admission, as to the double Committee system.

Then, in regard to the Dramatic performances. Without pronouncing any opinion as to the propriety, in the abstract, of such entertainments, which it would be out of my province to offer, I must urge, as I did at every meeting I attended in B—— after the "vexed question" came up—first, that if people think it desirable to have dramatic entertainments, they had better form a society especially for that purpose, not convert a Working Man's Club into such a society; secondly, that there is a great difference between an occasional dramatic entertainment being given, say, two or three times in the course of the year, and having them every week. A private family may get up such an entertainment, say at Christmas time, and invite friends to witness it, without any evil consequences; but if it were repeated every week, the household would soon be thrown into disorder. There are many amusements which are simply beneficial coming very rarely, but which, from the very interest they awaken, and their exciting tendency, would be decidedly injurious by frequent repetition. Dramatic entertainments and balls stand in this category. Daily and weekly recreation in a Club is needful and good; but if it be of too stimulating and exciting a character, it tends to absorb all the life and energy of the Club into itself. Classes are given up, even ordinary amusements are voted "slow;" quiet, steady men drop away from the Club, which is no longer the sort of thing they want, and a break-up inevitably ensues. Clearly, the great majority of working men don't want incessant dramatic entertainments, which, if carried to excess, are, therefore, a palpable perversion of the objects for which the Club was founded. And, as one would expect, in the B—— case, the great majority of the audience at the theatrical exhibitions were under twenty years of age.

As to the rent, it was certainly very heavy, and I agree with one of the speakers above quoted that the premises were not very suitable. But they were the best to be got at the time; and with good management would have answered very well till better were procurable. For in the midst of so large a population as that of B——, the Hall could have been advantageously let one or two nights every week, on an average, and have paid half the rent itself. But when there was so little judgment or proper attention, as to allow of a lad of fourteen being placed at the entrance to examine and take tickets, one sees enough to explain other weak points in the management of the Club.

Answering the question of one of the above speakers, I think the same amount of collision and alienation would not have arisen between a committee and trustees as between two committees—first, because, though trustees certainly ought to have vetoed the constant theatrical representations, their authority would be much more readily recognised by working men than that of a second committee of gentleman; and secondly, because if some of the latter had been sitting on the working men's committee, they would have talked the whole thing over in a friendly way before the evil had grown, as it were, to a head, and by judicious and conciliatory counsel, would probably have nipped the mischief in the bud.

I am thankful to state that, after an interval of about a year and a half, another Working Men's Club and Institute has been formed in this town on a much sounder basis, with every prospect of a long and useful career. It would have been established sooner but for the difficulty of getting suitable premises. Some of the best men connected with the former effort, to whom great praise is due for the sacrifices they made to establish and maintain it, have cordially put their hands to the plough again; and others, equally efficient, both gentlemen and working men, have joined them.

I conclude this article with the following extract from the letter of an hon. secretary to whom I wrote concerning a Club, in the formation and management of which he had taken a leading part. I believe there is a great deal of force in his concluding remarks about the Foresters and

---

* Continued from page 267.

Odd Fellows. It is quite possible social clubs so formed might be much better supported in some places than general clubs, and that there they should be established on that plan. But, as a general rule, one would much rather see the Clubs open to all working men than limited to those belonging to a particular Benefit Society or Trade. In this particular case, I however have reason to believe, that more regularity and business-like attention to the management of the Club would have made it thoroughly successful; but this does not diminish the importance of viewing the question in the light above mentioned.

"Dear Mr. Solly,— . . . . . I extremely regret to say that, practically, the Club is extinct. No Institution was ever more unfortunate in its early life. What with the two strikes, then a dishonest manager, then the necessity of my leaving the Club to those who were not sufficiently in earnest about it, its decline was inevitable. I have convinced myself, however, that another cause was at work to prevent such Club ever being *very* successful here. Our working men are very rough, with the exception of a small minority. The rougher ones have their Unions and Clubs for trade purposes, and they do not mingle with men of a different class, and the more intelligent men are nearly all Foresters or Odd Fellows. We have 500 Foresters in the town, and 100 Odd Fellows. Having joined this body, I see in their Courts the men to whom I looked for support in our Club, and who, I discover, find in Forestry much of that social life which we aimed to provide; and the discipline of the Court has no mean influence in the education of the members. I cannot but think, in looking at this Club question, that the true idea is that of Forestry—viz., the banding of men together for mutual comfort and support in times of trial, sickness, and for the affording opportunities for the moderate enjoyment of social intercourse. You have so long and well insisted on the necessity of the brotherly element being stimulated and strengthened, that it would be impertinence in me to argue how this is the principle of life, as it were, without which, blood, bones, and sinew are so much dead matter. I long to see the day when the various bodies of Foresters and the like shall dwell in their own club-houses, and combine all the features of the Institutions you have called into being, and those which now distinguish them from your progeny. . . . . Very earnestly wishing your Union every success, with kindest regards to yourself, I remain, yours faithfully," * * *

PROPERTIES OF NITRO-GLYCERINE.

Nitro-glycerine has been known to science nearly twenty years. It was discovered by the Italian Sombrero, in Pelouze's laboratory in Paris. The Swedish engineer, Alfred Nobel, was the first, however (in 1864), who turned it to practical account.

Properties of the Blasting Oil (Nitro-glycerine).

1. Nitro-glycerine is a light-yellow oily liquid.
2. Its specific gravity is 1·6.
3. It is insoluble in water.
4. Direct contact with fire, as, for instance, with a lighted match, does not cause it to explode.
5. The oil will only explode under certain circumstances, and it then burns away, leaving no residue.
6. It possesses great rapidity of explosion.
7. It can be kept for any length of time without losing in weight or in goodness.
8. It detonates on being struck with a hammer.
9. It can be heated without danger to 212° Fahr., but explodes at 356° Fahr.
10. It is poisonous, and causes violent headaches, which soon, however, pass off.

It may be proved, theoretically, that nitro-glycerine is stronger than gunpowder; for not only does its decomposition give rise to a larger volume of gas, but as the gas will be at a higher temperature than is the case with powder, we get a still greater effect. It has been calculated that nitro-glycerine has thirteen times the strength of an equal volume of gunpowder; eight times the strength of an equal weight.

Advantages of Nobel's Nitro-glycerine.

1. Considerable saving of labour in boring the holes for blasting. A small hole with the nitro-glycerine will do as much work as a large one with gunpowder.
2. Greater cheapness than powder, when power is taken as standard.
3. Blasting work can be done in a shorter time.
4. The fact that it leaves no residue after the explosion. This is important in working rock salt.
5. Great rapidity of explosion, which permits the nitro-glycerine to be used with advantage in loose rocks with many joints, where powder would have scarcely any effect.
6. The absence of danger in carrying it and storing it, in virtue of the properties described in 4 and 7.
7. The fact that solid tamping is not required. This saves time and expense, and lessens the danger.
8. Holes in watery places and under water can be easily charged. This advantage depends on the insolubility and specific gravity of the oil. All that is needed is to pour the oil by means of a tube into the hole covered with water. It sinks to the bottom, and the water above it does for the tamping.
9. It will blow to pieces lumps of metal.

Disadvantages.

1. The necessity of using cartridges for horizontal holes, and those sloping upwards.
2. In rocks that are much jointed, cracked, or cavernous, the bore holes must be made tight, in order to prevent the oil running out.
3. The effect on the nervous system and respiratory organs. The gases formed by the explosion cause headaches, and even sometimes vomiting. This is a hindrance to its employment underground, but is of little importance in quarries. The inventor is of opinion that it is not the gases formed by the explosion, but rather fine particles of the blasting oil, that are scattered about, which do the mischief.

Letters from Lancashire, by a Lancashire Lad.

VIII.—OPERATIVE NATURALISTS, &c. (*concluded*).

John Horsefield was born at Prestwich in 1792. His parents were very poor. His first schooling was at the house of a handloom weaver, who followed the two occupations of flinging the shuttle and teaching his scholars at the same time. The lads, about half a dozen in number, would sit about his loom, and go up to read their lessons to him singly, as he sat upon his seat-board. Horsefield was a very weakly lad, and suffered from fits of dizziness. He soon became passionately fond of books. With another teacher, to whom he went at nights for about two years, he obtained a knowledge of arithmetic—indeed, was so successful in his study of that science, that his master had to confess his inability to teach him more. Like many others of his class, his first inducement to the systematic study of botany was consequent upon the perusal of a copy of an old edition of Culpepper's "Herbal." He said that the romantic account of the virtues which Culpepper ascribes to plants affected his imagination in much the same manner that stories of giants did. He early took to his father's occupation of handloom weaver, and followed it—indeed, he depended upon work at it for bread—until his death, which occurred when he was sixty-two years old. It is interesting to trace this poor man's life—to see how, with all his disadvantages, he not only found time to pursue his favourite study of botany, but also managed to obtain a respectable acquaintance with astronomy, algebra, mensuration, politics, and verse-making. Before he could obtain any books on systematic botany, he had to join a society, of which his father was also a member. The small subscriptions were a long time in making up sums large enough to purchase the books needed. The first book which he obtained from the society was Lee's "Introduction to Botany," and here, for the first time, he came across an exposition of the Linnæan system. The Greek names puzzled him, but he determined to master them. He wrote the names of the twenty-four classes, and the explanations given of them, upon a sheet of paper, and pasted it to his loom-post, so that he could always look it over. By-and-by the names and characters of the classes, as well as the orders, were understood and treasured in his memory, and in his rambles he made practical use of his theoretical knowledge. Books were so scarce that, having obtained the loan of the two volumes of Turton's "System of Nature," which treat of the vegetable kingdom, he made what it contained his own by copying from it 1,640 essential generic characters. His knowledge of astronomy was respectable, although he had only one chance of looking at the heavenly bodies through a telescope. This was when he went with his father to see old Robert Ward, at Blackley. Besides letting them look through his telescope, old Robert showed them what he called a "solar system"—a rude mechanical contrivance showing the relative positions of the planetary bodies, with the sun in the centre. Young Horsefield was much struck with this, and made one for himself, perhaps ruder than its original, for it does not seem to have attracted him much afterwards. It became a plaything for his children, and was known to them, as they kicked it about, only as the "thingumbob." The chance expression of a friend seems to have awakened his curiosity respecting algebra. He borrowed books, and mastering the first four rules, he was soon mightily pleased that he could solve a question by simple equations. He tried to go further, but was so bewildered with surds and quadratic equations, that he gave algebra up altogether. But he never gave up botany. His proficiency in this science was such that for thirty-two years he was President of the Prestwich Botanical Society; and from 1830 to his death, in 1854, he acted as President of the Society of Botanists, which held its meetings on Sunday afternoons, in the villages situated within a radius of eight or ten miles of Manchester. As president, he must have attended hundreds of these meetings, and many thousands of specimens must have passed through his hands. His last days were made easier by a subscription, to which some of the most prominent gentlemen in and about Manchester contributed.

Those whom I have named so far excelled in botany, but I will now briefly tell the story of one whose special studies were in other branches of natural science. David Dyson was born in Oldham, in 1823, and in his early years he was a factory worker. Very early in his life he manifested a passion for collecting insects, and every penny he could possibly spare went to the gratification of his hobby. Before he was twenty years old he addressed himself to the study of ornithology and conchology, and his ardour was such that in 1843 he determined to make a voyage to America, with the special purpose of collecting specimens. He was at that time very poor, and totally unknown outside the district where he lived. His own savings, eked out by some money which an elder brother gave him, enabled the determined lad—he was then only twenty years old—to reach New York. When he stepped upon the shores of the New World he had only a few shillings in his pocket, but, undaunted, he set out on a tour through the States, across the Alleghany Mountains, and as far as St. Louis. He obtained bread by selling some of the specimens which he had collected to local museums. Before twelve months had passed he came back to England, and brought with him more than 18,000 specimens of insects, birds, shells, and plants; and amongst them were some which were very rare. Some of the leading naturalists heard of his doings, and were amazed at the success which he had achieved. He was invited to Sir Geo. Strickland's house, in Worcestershire, and the *Zoologist* commented upon the intelligence of this "young man, originally a weaver." He visited London, and, on getting to the British Museum, he found that his fame had preceded him. He was offered an engagement to go out to Central America to collect specimens. He started in September of the same year, and landed in Belize in November. He worked hard in Honduras until the end of 1845, and contracted disorders in the swamps there, which undermined his constitution. At Belize he received a sunstroke, and was obliged to return home. He had, however, been so successful that, before leaving, he was able to forward to England a very extensive collection, including a great variety of orchideous plants. The chief result of his enterprise was the addition of many thousand specimens to the British Museum; but he also executed private commissions, adding considerably to the magnificent aviary of the then Earl of Derby, at Knowsley. In 1846 the authorities of the British Museum sent him again to South America. This time he was accompanied by his brother, and after an absence of more than a year they came back, bringing with them, chiefly from Venezuela, a large collection of specimens, amongst them being a great variety of hummingbirds, moths, beetles, and shells. After this, David devoted himself mostly to the study of conchology, and, at his death, in 1856, at the early age of thirty-three, he left behind him a private collection of more than 20,000 shells, many of these very rare, and including about 10,000 different species. He was for some time curator at Knowsley, and held that post until the natural history collection there was sold. Although he was altogether self-educated, he succeeded in making friends of many highly cultivated men, and retained their esteem to the last.

Substitute for Silver.—An alloy of block tin 375 parts, nickel 55, regulus of antimony 50, and bismuth 20 parts, will be found to be useful in some cases as a substitute for silver, as it is unaffected by vegetable acid.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

We have much pleasure in announcing that the following gentlemen have kindly undertaken the adjudication of the Prizes:—The Right Hon. Lord Houghton; Right Hon. Lord Lyttelton; Right Hon. Lord Talbot de Malahide; Lord Milton, M.P.; Charles Buxton, Esq., M.P.; Rev. Charles Kingsley, M.A.; Rev. F. D. Maurice, M.A.; and the Rev. J. Begg, D.D.

Alleged Decay of the British Race.

At the last meeting of that very useful society with the long name—namely, the National Association for the Promotion of Social Science, a paper was read by Dr. Morgan, of Manchester, upon the "Deterioration of Race." Not much attention was paid to it. It was voted to be a dry, but felt to be a serviceable subject; and, for a penny, the reader could obtain in either of the Sheffield daily papers as much information as he cared for about it. Now all the "town" are, and have been for some time, talking about the paper, which is published in a separate form and bought up at eighteenpence. Dr. Morgan is a Manchester physician, who has contrived, by the re-publication of his paper, to call attention to an important topic. Useful as the pamphlet is, it would be much more so were it more intelligibly written. There is a copious use of the words "former" and "latter"—words which always make obscurity more obscure, and ought to have been banished long ago from our literature.

A scientific passage is generally abstract enough without the perplexing references implied by "former" and "latter." No hearer of the paper read could possibly tell what was meant; and there are some passages in the pamphlet which the reader requires to go over two or three times before he can fix upon the subjects to which these execrable little words relate. This is a pity, because Dr. Morgan's paper is one of vital interest, and all such papers, of which half relates to science and half to morality, require to be simple, lucid, and so clear, that the unprofessional reader should be able to understand all about it.

The moral of Dr. Morgan's little book is, that owing to the increase of our large towns, the physical health of the nation is impaired and is impairing; that our young men are no longer fit for soldiers; muscular development is decreasing; the action of the heart is feebler than in our forefathers; the population have less stamina to resist atmospheric changes; men do not bear pain so well as formerly, and are more subject to disease. One would like not to believe these uncomfortable things, but Dr. Morgan states so many facts, and reasons about them so soberly; he states them with such scientific caution and moderation; he seems quite free from theoretical crotchets, and writes, when he gets clear of "formers and latters," with a strong, manly sense that carries conviction with it. His little book is worth the study of working men, and should find its way into their reading rooms. It is one of many valuable papers which the Social Science Association has caused to come before the public, and it ought to be in the hands of town councillors, aldermen, and mayors, and all persons having control of the physical arrangements of a town. It is on this account, and because these are the persons who can best give effect to the author's advice, that we wish it had been written with that peculiar popular talent which Dr. Andrew Combe and Dr. Southwood Smith distinguished themselves by introducing into medical literature.

Dr. Morgan considers that the polluted air of large towns, hereditary diseases propagated by vice, and facilities of intoxicating habits being acquired, are the three great causes which lower the health of the British race. He states some new facts. One is that the centre of a large town, such as Manchester, will be in winter eight degrees colder than the temperature of the outside of the town, only two miles away—owing to the noxious vapours being so dense and shroud-like, as to prevent the rays of the sun penetrating to the earth. He would clear dense neighbourhoods, erect air shafts in them, increase open spaces for playgrounds, construct streets at right angles, so that the current of air could sweep the vapours through them; widen all streets, keep houses low instead of lofty, and assimilate as far as possible the town to the country. Narrow streets, winding passages, elevated buildings, all prevent the circulation of fresh air and the ready access of the sun's rays. Dr. Morgan shows by tables, which seem perfectly reliable, that labourers living in the country are stronger and live longer than men in towns. The notorious over-crowding of country cottages, though productive of diseases, do not do the mischief which might be expected, in consequence of the greater amount of fresh air which the occupants have outside their houses, and in which their work is performed and exercise taken.

It appears that our great manufacturing towns are constantly absorbing healthy men and women, who are allured from the country, and whose health is deteriorated. The towns send back no healthy people into the country. Indeed, the towns send their healthiest families abroad as emigrants. Dr. Morgan proposes that we send our sickly population abroad, and keep the healthy at home. Dr. Morgan advises that young mothers be not suffered to work in factories; that public hospitals be provided, to which, when fever breaks out, the patients may be at once removed before the neighbourhood is infected.

Want of fever precautions has caused, in the course of the last two years, 2,500 persons to be carried off in Manchester alone; while the total number of cases cannot have fallen short of 20,000 persons. There seems something awful in this wholesale murder. Who can help wondering that a great and wealthy city should suffer this silent carnage to take place in its midst? Dr. Morgan is a great benefactor for calling attention, in his unpretending, sensible, yet forcible way, to these appalling facts. Working men themselves should give heed to them. By temperance, by prudence, by taking care where they live and how they live, they may do much to secure that health which is necessary to maintain the vigour of the race. Are not the facts in Dr. Morgan's little pamphlet suitable for the consideration of the Trades' Unionists? Individual men, sensible of the evils surrounding them, may be powerless to cause their removal, but a union of working men, speaking in the name of hundreds or thousands of their members, could exert a voice in favour of local sanitary improvement, which the public will would strengthen, and no municipal body disregard.

The Origin and Uses of Trade Guilds.

The rise and progress of trade guilds or fraternities forms one of the most important features in our national history. In early times they were, indisputably, one of the chief means of securing the foundations of our commercial prosperity; and although, in later days, they have been greatly shorn of their ancient proportions, it is both interesting and instructive to look back upon what they were, and what they have done for us.

Associations known as guilds, or *gilds*, took their rise in Anglo-Saxon times. The word itself is from the Anglo-Saxon *gildan*, to *pay*, and in its original signification implies the union of a number of persons as *contributors* for a common object. The earliest societies of this kind were formed for political purposes. An old Saxon law required every freeman above the age of fourteen years to find sureties that he should keep the peace; and it was customary for ten families to enter into a guild, or association, to guarantee the good conduct of their individual members. A common fund was raised for the payment of any fine incurred by the fault of one of the society. By degrees other objects were added to the original intention, and the guilds came to serve the purposes of the modern friendly societies, affording mutual aid in sickness, &c.

After this early period we find two distinct classes of association bearing the name of guilds. The one was purely of a religious, and the other of a secular nature. It is with the latter that we have to do, and will merely remark with regard to the former that they usually had at their head a council of thirteen members, in imitation of Christ and his apostles. In one society the thirteen were composed of twelve men and one woman, the latter representing the Virgin Mary. Even some of the secular guilds adopted this number in their councils.

The secular guilds distinctly recognised the promotion of trade or professional occupation as a principal object, and, next to this, the mutual relief of distress. Three of these guilds are mentioned in Anglo-Saxon times. The first and most important at that period was apparently the Guild of Knights, the members of which had to undergo certain trying ordeals of arms before they could be admitted to the fraternity. Edward the Confessor granted to this guild the first royal charter ever bestowed upon a company of this sort.

The other Anglo-Saxon secular guilds were the Steel Yard Merchants' and the Saddlers'. The merchants of the Steel Yard were a company of Germans, who came to England for trading purposes, and received peculiar privileges, for the encouragement of commerce with other nations. The Saddlers' appears to be the most ancient of the guilds or companies now in existence, and in

their early days were in close connection with the religious brotherhood of St. Martin.

Very few notices of the guilds in the early Norman times have come down to us, although there is sufficient evidence that the guild system at this period spread and progressed rapidly. Indeed, it was natural that it should do so; for, in an age of violence and disquietude, men engaged in peaceful pursuits would seek the strength that is in union by collecting together, and endeavour to obtain the Sovereign's recognition and protection. In the reign of Henry II., great-grandson of William the Conqueror, guilds had become common, and we hear of eighteen London guilds being fined for having set up without the king's licence. In this reign a royal charter was granted to the Cloth Weavers' Company, and very wide powers, to which we shall have presently to allude, were conferred upon it for trading purposes. We also hear at this time of the guild of Goldsmiths and the Pepperers.

A great deal of jealousy and rivalry existed between these early companies. Two of them, at least, came to desperate strife. In the reign of Henry III., the Goldsmiths and the Tailors fell out so seriously that they determined to settle the dispute by force of arms. They appointed a meeting of 500 men on each side, completely armed, who fought so fiercely that many were killed and wounded. The sheriffs interfered, with a strong force, to restore the peace, and seized some of the ringleaders, who were executed.

Charters were bestowed upon the Fishmongers and the Linen Armourers (afterwards known as the Merchant Tailors) in the reign of Edward I. The powers exercised by the guilds at this time are illustrated by an old author, who tells us that the Bakers held four "hallmotes" every year, to inquire into offences committed in their trade, and to punish sellers of light or bad bread. In the reign of Edward II., we find it the rule that no stranger should be admitted to the freedom of the City of London unless he was a member of some trade or "mystery."

In this reign, also, it was found that the Weavers were exercising too much power; and a court of inquiry into the circumstances was held at the Tower of London, by order of the king. The subjects included in this inquiry afford the best illustration that has come down to us of the real and assumed prerogatives of the early guilds. They were asked, among other things, why no stranger was admitted into their body without producing testimonials of good conduct; why none might have implements of the trade in their possession unless the same were testified to be good and honest; why the implements of members whose contributions were in arrear might be distrained by the bailiff of the guild; why certain mixed cloths might be adjudged to be burned; why none were allowed to work between Christmas and Purification Day, or at night by candle-light, &c. &c. They pleaded in answer the ancient charters of the guild; but the jury, without having power to set these charters aside, declared that the privileges of the company were exercised "to their own profit and the common hurt of the people."

Important alterations in the constitution and position of the guilds took place in the time of Edward III., but an account of these we must defer for another paper.

The Artist Workman.

INLAID WORK.

The visitor to our Working Class Industrial Exhibitions has frequent occasion to observe the numerous indications of the pleasure which working men evidently take in all kinds of inlaying work, and the large amount of skill and ingenuity—to say nothing of patient labour—displayed by them in the construction of articles in which such work is available. There are many reasons for this: the principal being the fact that this description of labour is comparatively easy, requires no complicated tool-work, and can be carried on by the fire-side. The characteristic defects of such articles is, however, the want of taste. No matter whether it be a table or a small box, the object aimed at is to expend as much labour, not taste, as possible in the ornamentation of the surface. Thus, a mechanic will make a table, the upper portion of which consists of 1,000 separate pieces of wood, the result being far inferior to that attained with far less labour where the workman is influenced by real taste. The design is often merely a repetition or variety of the chessboard pattern, or else consists of squares and ovals jumbled together in lavish profusion. Now, if the constructors of such articles were to strive to infuse a little more taste into their labour—to produce, for instance, such beautiful specimens of workmanship as that given by us in our illustration, they would do much to secure for these exhibitions an amount of art-prestige, in which they are now utterly deficient.

Manchester Unity of Odd Fellows.—At the recent quarterly meeting of the Nottingham District of the Manchester Unity, held in the People's Hall, the auditors expressed their satisfaction with the quarter's accounts, which were passed in the usual manner. It appears from the annual report that, during the past year, the total payments for sickness have amounted to £2,093 17s. 3d.; the payments for funerals, £384; the total amount paid for sickness and funerals, £2,477 17s. 3d., in addition to which £241 2s. has been paid to the widows and orphans of deceased members; the management and incidental expenses have been £69 1s. 1d., amounting on an average to something less than 5½d. per member. These expenses include salaries of officers, rent of room, deputies to A.M.C., gift to General Hospital, relief to travellers, distress gifts, postages, printing, &c. The report goes on to say that, though the sickness has increased, the funds have also increased by the sum of £286 7s. 9d. over and above the amount of the previous year.

A Bird's-Eye View of the Reform Debates.

The Speaker of the House of Commons is a gentleman of family, fortune, and high position. President of the most distinguished assembly in the world, the highest nobles—such is the etiquette of Parliament—bow to him as they rise or leave the House, yet he comes daily to his work under circumstances which would be considered a hardship by most working men. Quite unable to walk, he is drawn into the House in a chair. He hops with extreme difficulty into his seat, and when there he is unable to rise without great pain, and has to crave the indulgence of the House to permit him to put the questions of debate without rising. Yet, in this state, he sits eight hours a night in his chair.

Mr. Baxter, member for Montrose, who has strong, pleasant good sense, opened the debate on the second night in a speech serviceable, but not notable—certainly not equal to his opportunity, nor to the expectations formed of him.

Sir Bulwer Lytton—who some years ago published an account of the benefit to his health he had derived from the water-cure, is now in the enjoyment, from some fortunate cause or other, of better health than during the last session—delivered one of his great speeches. Contrary to his custom, he spoke from the front Opposition bench. His voice is thick, and often indistinct, but bold and open. Notwithstanding the many graces and accomplishments of the great novelist, his gestures are angular and awkward, and he violates all the rules of oratory except the one of speaking up. His sentences, however, atone for all. So sparkling, so graceful, they charm all listeners. Sir Bulwer inverted the logic of history; he suggested that self-government might do in a new country (where the people are without experience or responsibilities compelling self-restraint), but in an old country (where there is cultivation, property, experience, tradition, and a thousand checks upon errors of legislation) it would never do. Nevertheless, the country party cheered the eloquent orator all the same. There was in Sir Bulwer Lytton a noble and generous appreciation of the working class. To the Co-operative "artisans of Rochdale, whatever be their political creed, he would be willing to grant the franchise;" and then he broke out into this honourable apostrophe:—"Willing do I say?—that word is much too cold. I wish that, like some old commonwealth of Greece, we might admit them to the franchise by acclamation, too proud of such fellow-citizens to ask what rent they pay for their houses." Many sparkling and memorable things have been said in these debates, but nothing equal to this burst of geniality, in which the man of genius and the scholar got the better of the calculating politician.

After Sir Bulwer, arose a speaker yet more famous among thinkers—John Stuart Mill—who

delivered the most exhaustive and comprehensive speech—loftier in thought, keener in logic, than any the House of Commons has heard since the days of Edmund Burke. When Sir Bulwer sat down, dinner-hour had come, and the House thinned; but Mr. Mill, in his first few sentences, arrested attention, and kept it. Members stayed, and dinners were postponed. Alluding to Lord Stanley, who had seconded the now famous amendment of Lord Grosvenor, Mr. Mill said—"he put it to the noble Lord's (Stanley's) intellect, clear—and, because clear, impartial." These were the words which arrested the House. Nobody could have said them but Mr. Mill. It was a new order of compliment. It was praise couched in a luminous definition. In any other assembly than the House of Commons, such a remark would have been lost; there it arrested attention like an apparition. Mr. Gladstone turned round to the speaker, in what may be described as rapt admiration. Mr. Disraeli looked up with curiosity, and though Mr. Mill, using no notes, paused four times in his speech, the House cheered and waited until the missing link of thought was found. When obtained, Mr. Mill's hold of it, until he had fully expressed it, was tenacious.

When Sir Bulwer Lytton speaks he provides himself with folios of notes, indeed, his whole speech appears to be written out before him to which he refers to refresh his memory. Mr. Mill had prepared his speech, but had no notes of it. Even Mr. Bright, whose impromptu power is well known, avails himself of notes. Preparation is a great merit in oratory. To predetermine what you will say, and to provide indications of it, is a mercy to an audience. No hearers should trust those who trust to memory, or to chance. How much the eloquence of Parliament would be improved and abridged, did each speaker take the care Mr. Mill, Mr. Bright, or Sir Bulwer Lytton takes to prepare his speeches beforehand!

Mr. Laing and Sir George Grey were the most notable persons who concluded the second night's debate. Mr. Laing is nothing particular when he is not commercial. Sir George Grey neither excites the curiosity nor admiration, though he always commands the respect of the House. He is like a window, he admits light, but does not give it. He is useful, but not wonderful. He enables you to see what is to be seen, but he shows you nothing new.

The third night of the debate was neither dull nor brilliant, but a mixture of the two. Mr. Maguire, in a clear, loud-spoken, sensible speech, pleaded that pledges be kept and the working classes be invited within the pale of the constitution. Mr. W. E. Forster was far less interesting than when out of office. Mr. Layard, who followed, was infelicitous in his arguments; nevertheless, the member for Lambeth has a hearty friendliness for the working class, and vindicates them with a fearlessness which is more than politic: it is known to be real. After him, Sir Hugh Cairns, the most polished and subtle member of the Opposition, made one of his caustic and refined speeches, but without saying anything memorable.

The fourth night's debate was opened by the new member for Glasgow, who obtained credit for the way in which he seconded the address to Her Majesty on the opening of Parliament. Mr. Graham has the good sense to write his speeches, but this does not secure perfection, although it tends to check extravagance and persiflage. The excellence of what is written, as well as what is said, depends upon the ideas in the mind of the inditer. In proposing or seconding a ministerial address, the speaker has the advantage of official suggestions, and he may, if he pleases, avail himself of official revision. This appears to have been useful to Mr. Graham on a former occasion.

After him, came Lord Elcho, the only Scotch member who can be witty without being "wutty." Lord Elcho has a light, gay, airy manner, which gives to his speeches a colour of insincerity, or of utter want of seriousness. As, however, his lordship is known to have convictions, he does himself an injustice by the light Palmerstonian tone which he adopts. On this occasion, however, his gayness of tone was a merit in a debate which was growing dreary. A splendid voice, a confident manner, and a fluency which never falters, make Lord Elcho a speaker of interest. Sir William Hutt, member for Gateshead, defended himself with great spirit and eloquence against the reproaches levelled at him for having withdrawn the amendment of which he had given notice. The new thing of the night was a speech by Mr. Doulton, the member for Lambeth. Sitting beside his colleagues, he rose, and took the converse view of the question, giving a sharp personal antithesis to his opposition, both to his constituents and the Bill. His speech was well conceived, and particularly well expressed, and there was a certain power both in its conception and delivery which must raise Mr. Doulton's position in the House; but he bade openly for Opposition cheers, and obtained them. This speech will probably cost him £4,000 and his seat too. Costly oratory.

Mr. Milner Gibson followed, and to that suavity of address for which he is remarkable, he added what is remarkable with him, a dash of force and fire. His great superiority as a tactician over the less-calculating efforts of his colleagues was apparent in every sentence. He relinquished for a time his hold upon the House, making an excursion into the sea of statistics, where no man but Mr. Gladstone—and not he always—can allure followers from the shore.

The numbers of persons who throng to the House continued on the fifth night as great as ever. The expectancy of great speeches, which, however, were not delivered, kept up the competition for seats, but the debate was evidently lingering. Mr. Leveson Gower opened the debate in a speech decided, thoroughly liberal, fair, and sensible. Mr. Gregory followed with a sparkling speech, which would have been very effective had the points been kept closer together. Just as Lord Elcho happily relieves Scotch gravity with pleasantry, so Mr. Gregory tempers Irish vivacity with logical digressions and a certain classical polish. Mr. Young, the Scotch Solicitor-General, soon brought back the House to gravity. Sir Stafford Northcote, who could not be lively for the life of him, did no violence to his reputation, by being even interesting. Mr. Coleridge followed. He inherits an oratorical name, and brings into the House a perfectly parliamentary manner. Pertinent and practical, with a voice that would make even nonsense musical, he charmed the House by a speech calculated to advance the Bill.

On the sixth night of the debate, Mr. Bright, it was known, would "take the floor," as the Americans say, and the excitement to hear him speak was very great. The House had never been so crowded during the debate. Had there been an hydraulic machine at the doors, the applicants for admission could not have been compressed sufficiently to pack them all in. Many anxious to be present at the great debate were outside tonight. The fame of Mr. Bright as an orator had brought down large numbers of peers. It is certainly a great triumph to be the centre of such powerful attraction. Unfortunately, the orator was hoarse, which would rob any oratory of its charms. The most magnificent creation of Beethoven would come to grief with bad catguts. In addition, it was Mr. Bright's design to make merely a dispassionate plea for the Bill, which was, no doubt, the wiser course; but it need not have been so level, not to say tame. His peroration had the natural dignity of the speaker when he referred to the condition of the industrial classes, no longer pining for food, of whom it might be said, in the noble line of Sheridan—

"Content sits basking on the cheek of toil."

After Mr. Bright, Messrs. Whiteside, Walpole, and Goschen spoke in their characteristic style, and with the aid of an historical speech on the great men who have *not* sat for small boroughs by Mr. McCullagh Torrens, made up a useful evening. Mr. Whiteside did not excel. Mr. Walpole was not oracular, and when he is not, he is not interesting. Mr. Goschen did not speak in his best manner, though he used good matter.

The next evening, the debate was resumed by Mr. Lowe, in a speech of unexampled brilliancy, which extorted the admiration of all who heard it, although it opposed the principle of the Government Bill. It displayed the possession of a wonderful intellect, but will certainly render the speaker more unpopular than ever with those to whom he is opposed.

Several members followed in swift succession, among whom was Mr. Leeman, who argued that the spread of railways and commercial enterprise had created a large class of artisans who were deserving of the franchise, and denied that they would combine for political ends.

Then came Mr. Childers, who, possessing a large amount of colonial experience, was selected by the Government as the rival gladiator to Mr. Lowe. He controverted some of the arguments derived from the workings of democracy in Australia, and defended colonial legislation on such subjects as religion, education, and self-defence, maintaining that the defects of their commercial policy were attributable to the influence of the agricultural interest. In reply to the objection that the Bill would give predominance to the working men, he argued that no class could obtain predominance, except it could elect members from its own body.

On the concluding evening, Viscount Cranbourne made a powerful address in favour of the amendment. Captain Grosvenor and others, including Mr. Baines, followed on different sides of the question, the concluding speeches being delivered by Mr. Disraeli and Mr. Gladstone. That of the former was of characteristic quality; in that of the latter—spoken between three and four o'clock in the morning, the peroration surpassed all former efforts of the great master of oratory. "I ask you," said he, "in the language of Sir Robert Peel, to 'elevate your vision,' to raise it above the fears, suspicions, jealousies, attacks, and recriminations, and look onward to the time of our children and our children's children, and consider whether there is not a steady movement of the labouring classes onward and upward which calls for our attention, and demands that we should provide for these things while there is yet time."

Morning broke over London as the division was announced—For Ministers, 318; for the amendment, 313. Majority for Ministers, 5.

The Factory Poetess.

This is the age of working men poets. They are to be found everywhere, singing at the loom, in the mine, or, like Burns, behind the plough; but what of our working women? Have they no poetry in their souls? We have had many female votaries of the Muse, from Elizabeth Barrett Browning, with her wealth of womanly tenderness and impassioned pleading, to Eliza Cook, whose simple lyrics of every-day life have found their way into the hearts of our toiling millions, and there made a home for themselves. But where are our working women singers? There surely must be some. The love of poetry cannot be dead within the hearts of those who share with man the daily battle for bread, and whose gentle nature and loving sympathies shed a golden halo of happiness around the lowliest abode. Nor is it dead. Amid the din of the factories and the noise of the workshops, we sometimes hear the soft, tremulous notes of those who, like Ruth Wills, strive to lighten, with the aid of song, the dark and gloomy path along which Labour has so frequently to travel. We cannot believe that such women are rare; it is their violet-like modesty which prevents them from obtruding themselves into the glare of public notice. At any rate, such was the case with our factory poetess—the song-maiden of labour—Ruth Wills, whose life, simple as are its details, has a touch of pathos.

"My parents"—says our young poetess—"were poor and illiterate; but they belonged to that illustrious band who are 'rich in faith, and heirs of the kingdom of heaven,' and they sought, by every means in their power, to bring up their children to honest and industrious habits, and to instil into their minds sentiments of piety and virtue. Among my earliest recollections is that of being sent to a dame's school, where I imagine I could not have been a very docile pupil, as I well remember some rather sharp contests carried on between the good old dame and myself concerning the pronunciation of certain words, and for which, as I would not give up my own opinion, I received some floggings. At seven an irreparable loss befell me in the death of my beloved father, who had been a most affectionate parent. He had served in the army, and was stationed with his regiment at Madras for eleven years; and many were the tales of that land of the sun with which he was wont to amuse his children. I fancy that his descriptions of the tiger-haunted jungles, of the luxuriant vegetation, and of the poor soldier's weary march under the glowing sky of the tropics, must have been tolerably graphic; at any rate, they took great hold of my imagination, for I

used to dream of them years afterwards. My loss, I said, was irreparable, though, of course, I was too young to know its full extent; but I learned some lessons from the meek resignation and strong faith displayed in his last days which I have not yet forgotten. My mother having now nothing to depend upon but the product of her own industry for the maintenance of herself and two children, was obliged to go out to work and leave my sister and myself at home to keep house, setting us our task work of seaming hose every morning before she went, that we might be getting into the way of earning our own livelihood.

"When I was between eight and nine years of age, I was considered quite old enough to be sent out too, and a place was obtained for me accordingly, where I was employed in various kinds of warehouse work, and for eighteenpence per week I had to labour from seven in the morning until eight or nine at night; I was, however, allowed one hour in the week, as a great favour, to attend a writing-class held at our Sunday-school. After some time I left this place to go to another, where I was promised better wages, but I had to work more hours still, and was treated altogether so hardly and so harshly, that I do not love to think of it. It was—

'Work, work, work,
From weary chime to chime;
And work, work, work,
As prisoners work for crime.'

"It was well that this period did not last long, or its influence would have gone far towards counteracting all the good I had received from other sources. But a better time was at hand—work grew scarce, and what might, in some respects, be considered a calamity, became to me a positive blessing. It was then that I first learnt to love Nature, or rather it was then that my love of Nature first had an opportunity of developing itself. Mother had no employment for us at home, and when there was no work there was no food, so she gave us all she could—*liberty*—sending us out of her way in the morning with a basket, with an injunction to bring it home again filled with fire-wood; then, with the bright summer day before us, we would set off for the fields round Leicester, and, if it kept fine, stay out until the evening. Very pleasant to look back upon are the hours I then spent in making the acquaintance of bird, and flower, and tree. We made necklaces of daisies, and trimmed our bonnets with wild roses and blackberry blossoms; and if we were hungry, we ate the tender shoots of the hawthorn and the honeyed petals of the red clover flower. I do not mean that we went entirely without food at this time, but as mother made it a rule never to run into debt, our supply was both scanty and uncertain, though few people guessed anything about it. 'Brightest things are fleetest,' so sings the poet, and so it turned out with me: the 'blessed time' did not last long. When I was eleven years of age, mother had the good fortune to get me into the warehouse where I am still employed; and now no more delightful wanderings, no more pleasant experience of the '*dolce far niente*'—henceforward it must be work, woman's work, dreary and monotonous sometimes, yet pleasant withal, as it rewarded me with the proud consciousness that I was not only able to eat my daily bread, but to earn it.

"I must now speak of the Sunday-school, where I was still a constant attendant, taking considerable interest in its lessons, and warmly attached to my teacher—a lady whose entire devotedness to her class I have never seen equalled. It was a red letter day in my calendar when our library was opened. I had always been fond of reading, and eagerly devoured every book that came in my way, especially stories of wild adventure and fairy tales; but my appetite was now to be ministered to by more wholesome fare, and I read delightedly some old volumes of the *Youth's Magazine*, with its charming essays by Jane Taylor.

"But better still was coming. I think I was about fourteen when a lady, now, alas! no more, lent me Milton's 'Paradise Lost,' which I had long desired to see. The reading of it was to me the opening up of a mine of rich treasure; it was the discovery of a new world—a world of beauty and brightness of which I had before no idea.

"I should have remarked that about a year previous to this, through some influences which I need not speak of here, there had come over me a great change—that which my dear minister would call 'an awakening of the entire consciousness.' I had become thoughtful, and anxious to be at one with the good Father above. It would seem as if heart, and mind, and soul were aroused all at once, and all things in earth and sky wore a new aspect, and spoke to me with a new voice. When I read Milton's matchless poem my whole soul responded to its unearthly music. I was enraptured, and could scarcely sleep at night for the echoes of its wondrous melody. Thenceforward I lived in a world of my own, illumined by a 'light that never was on sea or shore.' Life was never to be joyless again—

'For I on honey dew had fed,
And drunk the milk of paradise.'

"Shortly after this I essayed to write verses, and after several attempts ventured to send a piece to a local magazine, where it was inserted, to my great joy, with an approving notice by the editor. Since then the exercise of this faculty has afforded me the purest enjoyment. The course of my life has been monotonous, and would, perchance, have been wearisome, but for the flowers of poesy springing up by the wayside. Thrown by circumstances among uncongenial fellowships, it has been through the medium of books alone, and especially of books of poetry, that I have been able to cultivate the society of the wise and good, of the learned and refined. Shut out from the circle of taste and intellect by my lowly position, I am fain to think that I have enjoyed more than an equivalent, in communing through their writings with the star-bright children of literature and song."

Noble words these. They reflect a brave and earnest nature, one determined to make the best of its fate; not whimpering its doleful tale of sorrow, or muttering its fierce jealousies of those better off than itself; but rearing itself upwards to the heroic dignity of those true English men and women whose lives have taught us that there is no position so obscure or rank so lowly, but it can be illumined by the radiant brilliance of faith, hope, and love. Ruth Wills has a future lying before her—a future of which many in more exalted, but not more useful spheres, might well be proud. It will be her fate to teach the daughters of industry what they *might* be, without any sacrifice of their usefulness or their womanly nature. In fulfilling this mission, Miss Wills will need all the kindly sympathy and encouragement which we can give, and there will be few hearts so cold, apathetic, or careless, as to refuse their little meed of assistance in aiding the onward progress of one of whom England's daughters should feel proud, both for her literary abilities and the instructive story of her life—a life which has not been without a purpose.

The Paris *Moniteur* contains a decree by which a prize of 50,000f. is allotted, within the next five years, to the person who will discover a system by which the voltaic battery can be applied with economy to heating or lighting purposes, to the advancement of chemistry, manufactures, machinery, or medical science.

Greenwich Time and the Factories.—Mr. Baker, inspector of factories, urges the necessity of adopting Greenwich time all over the country. He says: "The value of such an arrangement, not only to the working classes, but also for all purposes, both public and private, I need scarcely attempt to point out. In England, even in small towns, the difference in clocks is often a source of the utmost annoyance. In large towns, in which there are several railway stations, it not only often causes a great loss, but a great inconvenience. In Belfast, the passer-by sees public clocks showing English time and Irish time together, the one being twenty-five minutes behind the other; and, no doubt, it is the case, also, in other parts of the kingdom. To the working classes, everywhere, this want of universal time cannot fail to interfere, not only with their hours of labour, but with their domestic comfort. By the Factory Act, all works under the law are to be regulated by a public clock, to be approved by an inspector. But since railway-station clocks have become so common, public clocks, heretofore so called, have been allowed to become extremely irregular; and there is hardly a passenger who would trust for his time to a church clock, for example, or to anything but railway time, for the best of all reasons, that he might lose his his journey and his money, if he did. But it is doubtful in law whether railway clocks are public clocks, and we have been defeated in an attempt to make them so. A public clock in every town of any size, fitted up by the local authorities, and supplied with regular time by a national telegram, would not only be the focus of time for all the surrounding country, but of all the clocks and watches in the town itself; and perhaps there could be no national expenditure which would be so productive of national economy."

A Year in the Working Woman's College.

The establishment of the Working Woman's College was a great and difficult experiment, both on account of its novelty and the amount of working-woman apathy which had to be encountered. Before the opening of the College, the promoters had no power of judging how many would avail themselves of the opportunities afforded them; but the experience of the first term did much to prove that there existed a real need of the means of education among working women. The College was opened in October, 1864, and between that time and Christmas, 150 students entered the institution, the total number entering during the year being 231. The occupations of the students were as follows:—Assistants in shops, 35; artists, monogram and flower painters, 9; barmaids and housekeeper, 4; bookfolders, toothbrush drawer, 8; burnishers and jewel-case liner, 6; corrector of the press and telegraphic clerk, 2; dressmakers and milliners, 36; domestic servants, 6; feather-makers, cap-front and straw-makers, 5; ironer and blind-maker, 2; machinists, embroiderers, and braiders, 10; photograph mounters and watchmaker, 7; secretaries and bookkeeper, 3; students (medical), 2; teachers, 54; waistcoat-makers, upholsterers, and needlewomen, 12; "at home,"* 119.

As to the time during which the students remain in College, no report has yet been made; but it is found that many come to the College for a short time, and then pass out again. This influx and efflux of students forms the great difficulty of the promoters, who state that there are many reasons for it. The College work of the students is to them the recreation, not (as with women-students in other classes) the business of their lives. They can come to the College only while the employments upon which they depend for subsistence permit them to come; the necessity of going where work is to be had—to parts of the town, miles away, it may happen, from Queen Square; the frequent change of employers, and therefore of places of abode; the lateness and irregularity of the hours of work in most trades, are fruitful reasons why the students must often give up the luxury of learning. Then, again, the household duties which are necessarily demanded from women, in addition to their industrial work—the mending, the cleaning, the tending of aged parents, the nursing of sick people—these things draw very largely and constantly upon the time and strength of working women, and when any pressure comes the College work is almost inevitably the first to be given up. Those, we believe, who value the College the most, and like their studies the best, are the least likely to neglect for them more pressing and difficult duties. Knowing all this, and feeling strongly how many peculiar obstacles, over and above the ordinary difficulties of study, the students have to brave in steady application to their work, one cannot wonder that many, not so earnest to learn, should be daunted by difficulties, and diverted from their intention to improve themselves by unfavourable circumstances.

Respecting the capabilities of the students, the reports of the teachers are highly satisfactory. In the English grammar class, Miss Ellen Drewry says:—"Want of accuracy, traceable generally to want of cultivation, is the chief difficulty to be contended with. As to the general spirit in which they work, nothing could be better; they are attentive, very grateful, pleasant in receiving correction, and evidently desirous to answer to the best of their abilities all my demands." The subject of social economy attracted but a small attention during the year, and the promoters express themselves sorry that the importance of the subjects which this class deals with should be so little understood. The value of physiology, on the other hand, seems to be so thoroughly recognised by women, that it has always attracted excellent and most interested classes, both when taught by Dr. Chapman and now, when Miss Garrett has come forward, at the first moment of her own success, to teach the students. The preparatory classes have answered the original

* The students described as "at home," are, in many cases, young girls whose occupation has not yet been determined; in others, women who assist in the trades of their fathers or husbands, or who, by helping in the housework of the family, save the employment of servants.

intention well. It has been very touching to see how pupils of every age—young girls, and married women—have endeavoured in the reading and writing classes to make up for the deficiencies of years, and have fulfilled their ambition, in many cases, by passing into the classes of the College to go on with what they have so well begun.

It remains to be proved what intellectual results the College will be able to show in the coming future. The promoters intend in a short time to put before their students a systematic scheme of study and examination; but in the meanwhile they are encouraged and gladdened in their labour by feeling that they are doing something towards giving many women, who have long desired it, the instruction they could not get elsewhere.

The social side of the College work has given still greater encouragement. Though little has yet been done in this way, the value of that little is already most evident. The College coffee-room, the conversational meetings, and the occasional larger gatherings, have made the place a centre of bright, cheerful, social life, where thought is stimulated and education is helped in many ways besides that of intellectual training. Already it would be hard to say what the College is to many, both teachers as well as students. A place where solitary women have found friends, where some, saddened by toil and privation, have learned to see that life has another and a brighter side! A place that is good to enter, because in its atmosphere of happy work and large human interests, small and selfish cares are forgotten! A place, too, that makes the teachers constantly feel that, what those who are struggling with the trials and toil of working people's lives crave, with a noble instinct, is help to live worthily!

Facts and Memoranda.

A cube of sandstone of 3 in. becomes crushed with a weight of 8 tons 4 cwt. 1 qr. 9 lb. In all cases sandstone gives way suddenly under pressure. Limestone is more than three times as strong, and gives way gradually by cracking and splintering. Good bricks laid in cement stand about 33 tons per square foot, equal to a column of such brickwork more than 500ft. high.

Art at Lyons. — The population of Lyons is thoroughly impressed with the immense importance of the cultivation of art in the interest of trade. The superiority of the Lyons designs, as well as of the artistic execution of those designs, has long been admitted; and the manufacturers and residents of the town and neighbourhood are indefatigable in their endeavours to maintain the reputation of the town unimpaired. The annual exhibition of works of art is the most important, after that of Paris, in all France. The Artistic Society of the town, besides establishing and maintaining the annual exhibition, has set on foot competitions in historical painting, the painting of flowers, drawing, the composition of ornament, engraving, and lithography. Towards the cost of these competitions, which occur after each annual exhibition, the Emperor contributes a donation of 1,000 francs; every step made in advance by the Lyonese artists being an important fact as regards the country at large. It is only by such means as this that pre-eminence in artistic manufactures is to be attained or kept.

Damp Walls.—The following recipe has been recommended by a Newcastle firm for curing damp walls:—Remove the whole of the damp plaster down to the surface of brick or stone walls, rake out the joints, clean and well wet the surface; lay on a coat of good Portland cement, mixed with one-sixth sand; be careful to cover every part of the brick or stone, broom or otherwise roughen the surface of the cement while soft; let this stand a few days, to get a hard skin on it, then replaster in the usual way. It will not do well to finish the inside surface with Portland cement, as condensations will take place on the surface in damp weather. If speed in execution be desired, the surface may be finished with plaster of Paris, Keene's, Parian, or Martin's cement, with the usual proportion of sand.

The School.—The people who possess the best schools is the first among nations; or, if it be not so today, it will be to-morrow. Intellectual wealth is, next to virtue, the chief good, and it is the source of all other good; even in an economic point of view, it is the most productive wealth. The total wealth must necessarily increase in proportion as it is produced by the most skilful workmen. In different factories there have been placed in two separate workshops an equal number of uneducated workmen, and those possessing a knowledge of reading, writing, arithmetic, and drawing, &c. Experience has always proved (and how could it be otherwise?) that the work performed by the ignorant workmen was much inferior to that of the others.—*Jules Simon.*

Things Talked About.

Mr. Mill has revived the consideration of a subject which has been frequently discussed—the probable duration of the coal supply of Britain, and the effect of its diminution, or cessation, indeed, upon the commercial greatness of the country. The philosophical member for Westminster has achieved an intellectual victory in inducing the House of Commons seriously to entertain the principle that legislation should have regard to the future as well as to the present. It must be owned that we are too prone to enjoy at once all the advantages of our prosperity, and make no provision for the rainy day that may come. If we do not quite echo the famous saying of the Hibernian senator—"Why should we do anything for posterity? Posterity has never done anything for us"—we have, at any rate, acted very much in that spirit. So, when Mr. Mill argues that a present surplus of revenue should be applied to lessening the debt we leave to our successors, who will probably have to endure a "coal famine," we recognise the largeness of his views, although we may not be able to share his apprehensions. There is a wonderful principle of compensation at work in the government of the world. Old states have died out, but new ones have sprung up; the fertile plains which have given place to barren wastes have been succeeded by "fresh fields and pastures new." And in this special matter of coal, it should be remembered that the British coal-fields form but a fraction of the area of the coal districts of the world; that, at present, we export vast quantities to countries actually richer than our own in the mineral; and that imperfect machinery adds a great waste to the loss entailed by improvident domestic consumption. As the coal-fields of America, Australia, and other places are brought into work, our demand on home resources will be lessened; and it is quite within the scope of commercial vision that we may be able to import coals as profitably as we now do corn, the supply of which we were once told must not depend on foreign sources, under penalty of something like national extinction. At present our export of coal is very large, no less than 1,870,818 tons in the quarter ending March last.

The subject is worthy of the bestowal of a little more space than we usually afford in this column to one subject. We are told, on good authority, that nearly nine-tenths of the coal consumed by engines is absolutely wasted, as far as mechanical power is concerned; that the waste in domestic culinary processes is "enormous." Surely, science will ere long at least ameliorate this evil. And, indeed, a considerable step has been made in that direction. A monster locomotive, the *Colossus*, has just been brought into use on the London and South-Western Railway, which will draw eighty loaded wagons—altogether a weight of nearly 1,000 tons—and only consume fuel at the rate of 28 lb. per mile. The ordinary consumption for goods engines not half so powerful as the *Colossus* is 50 lb. per mile. Now, for the means of supply when our own are exhausted. The coal area of Great Britain and Ireland occupy about 12,000 square miles; but the very lowest estimate of the area of the coal-fields of the United States is 20,000 square miles; but another estimate, by a very careful statist, makes it actually over 133,000 square miles! British America is known to possess 18,000 square miles (more than half as much again as the mother country) of coal formation; and then we have Australia and New Zealand, not very rich, perhaps, but telling for something. The American fields (the United States and the British provinces together) will yield, it is calculated—taking a very moderate average thickness of seam—something like four millions of millions tons of coal. So, it may be many thousands of years yet before our furnaces are extinguished for want of coal, or the English workman be puzzled for the wherewithal to boil his pot. Indeed, some of the coal-owners of South Wales are already declaring that they have in their mines an almost illimitable supply. In the meanwhile, new motive powers may be discovered which will supersede the use of coal and engines altogether.

Mr. Halcro, of Sunderland, writes to the newspapers on the subject of "The wealth of our working men," and gives fresh evidence of the fallacy of taking savings banks deposits as the sole gauge of the prevalence of provident habits among the working classes. Speaking of his own town, he says:—"The subscribed capital to building societies in Sunderland is £2,000,000 sterling, and is being paid at the rate of £300,000 annually. The number of members is 20,000, but as about 8,000 are located in neighbouring small towns and villages, only 12,000 are residents. After deducting 2,000 to 3,000 belonging to the middle classes, we still have 9,000 to 10,000 working men in the midst of us to be reckoned among the temperate, the industrious, and the provident."

It would be well if some of those persons—members of Parliament, or otherwise—who fear that to extend the franchise to a larger number of the working classes would be only to submit it to a violent and unscrupulous mob, and so render fair, honest electioneering impossible—were to watch the proceedings at the elections to Trade Pension Societies, Orphan Asylums, and other institutions, especially the property of the working classes. Zealous labour on behalf of chosen candidates is accompanied with a spirit of fair play and love of order, and a forbearing and tolerant spirit which might well be emulated by many who shrink from admitting the working man to a share, however remote, in the government of the country.

The Co-operative Societies of the North are vigorously protesting against the exclusiveness of the savings bank clause, and claiming the extension of the principle so as to include all enrolled and registered societies. Mr. Akroyd, the member for Halifax, and Sir Francis Crossley, representative of the West Riding, have undertaken to champion the cause.

It is terrible to think that some manufacturing processes are fatal to those employed in them. Scientific men would render the greatest service if they could point out some means of counteracting the effects of the poison to which the workers—in lead factories, for instance—are exposed. But, in the meantime, the persons employed may do much for themselves. Personal cleanliness, temperance, attention to health generally, will, if they do not quite nullify the injurious action of the poison, at least greatly mitigate it, and deprive it of the greater part of its mortal terrors. A woman employed at a lead factory died a few days since, of lead-poisoning. There was no doubt, at least, that the action of the metal was the immediate cause of death; but she drank hard, and, as a consequence, was unable to eat a sufficient quantity of wholesome food. The verdict was—"Death from lead-poisoning, accelerated by drinking ardent spirits and want of food." No scientific discoveries, no legislative enactments, ever can do much for working people if they will not be temperate and cleanly. That is a law of nature which is invariable.

The short-time movement is not so popular in America as in this country. The commission upon the labour question have made their report to the Legislature of Massachusetts. They oppose the adoption of an eight hour law for these reasons: "1. Because they deem it unsound in principle to apply one measure of time to all kinds of labour. 2. Because, if adopted as a general law, in the way proposed, it would be rendered void by special contracts, and so add another to the dead laws that cumber the statutes. 3. Because a very large proportion of the industrial interests of the country could not observe it. 4. Because, if restricted, as some propose, to the *employés* of the State, it would be manifestly partial, and therefore unjust."

The Committee of Management of the Peel Park Museum, at Manchester, are determined to possess a novel and interesting portrait gallery of living celebrities, which in the lapse of time may grow into the importance of a national historical treasure. It is now intended to form a gallery of photographic portraits, of uniform style and size, about 8in. by 6in., to be taken from the life in the first instance, and printed by an important process, invented and patented by Mr. Swan, of Newcastle, which is claimed to have made photography as permanent and indelible as a printed engraving. We hope that care will be exhibited in the selection of portraits, so as to represent the real active intellect and patriotism of our time.

Mr. Gerald Massey, whose portrait we recently presented to our readers, has set himself to solve the vexed problem of the true meaning of Shakespeare's mysterious sonnets. It will be an enduring honour to the working classes if one of the number, who has strengthened his intellect and ripened his perceptions in a fierce struggle with the impediments which crowd the way to "the steep where Fame's proud temple shines afar," should be the first to interpret rightly the utterances of the greatest of all poets, himself sprung from the ranks.

We have before us an interesting little work, a "Report of the Social Organisation of the Saracen Foundry (Glasgow) for 1865." It includes the proceedings of the Mutual Improvement Society, description of the annual excursion, a *soirée*, concert, and assembly, and an exhibition of the industry of the persons employed in their leisure hours. Nearly 800 persons are engaged in the foundry; and they seem to have made good use of the opportunities afforded them by the liberality and encouragement of Messrs. W. Macfarlane and Co., the heads of the establishment. The exhibition of works of industry included models of machinery, furniture, figure-modelling, and, on the part of the females, of needlework, knitting, &c. Drawings, original compositions in prose and verse, and handwriting were also exhibited, and prizes were awarded in all the classes. The literary efforts, in which the females took their full share of honour, are creditable in every respect.

The sooner Benefit Societies and Lodges are removed from public-houses the better for the members. That, we believe, is generally regarded as a truism; but, like many other truisms, it is more frequently uttered than acted on. We are glad, therefore, to see that the Foresters of Paddington have resolved to purchase Portman Hall, a commodious place for their meetings, and quite free from temptations to drink.

Lord Elcho is at issue with the Reform League. A year ago he delivered a speech on Reform, in which, as reported, he said that "an extension of the franchise would let in a mass of men who were improvident and indolent." This report Lord Elcho now corrects, saying that the words he used were, "improvident and igno-

rant. The correction does not much mend his position; and working men are disposed to consider one epithet as great a compliment as the other.

We cannot conceal from ourselves that the extensive trade organisations among working men, the frequency of strikes, and the frequent violence of over-zealous partisans of trade rights, have created a spirit of animosity on the part of many men of political influence, which prevents them giving fair consideration to the political claims of the working classes. Very conspicuous was this feeling in the brilliant speech of Mr. Lowe. He seized adroitly on a few threatening letters, a few intolerant actions, and forgot the abundant evidence of intelligence, providence, and political moderation on the other side of the argument.

It is unfortunate indeed—for it places weapons in the hands of those only too happy to use them—that just now, when a claim is made for a larger share for the working man in the government of the country, strikes should be so prevalent. That consideration is quite apart from the reasonableness or otherwise of the strikes. But it is a fact, and the manufacturing interest makes the most of it, that demands for advance of wages and reduction of hours of labour, are just now being pressed with unusual pertinacity. The carpenters and joiners have refused the offer of the master builders, insist upon eightpence an hour as the standard wages, irrespective of the skill of the men, and a uniform day of nine hours, both in shop and out-door work; the journeymen tailors of Greenwich, Deptford, and Blackheath, have struck for an advance of wages; so, too, have the London wireworkers, and the seamen and foremen connected with the steam-ship service of Hull; the masons, labourers, and tailors of Durham are out on strike, the masons, and joiners having recently obtained an advance of two shillings a week; and the introduction of German tailors into Edinburgh has fomented the discord which, we fear, is not likely soon to be lessened. Some of the Yorkshire gardeners have struck for an advance of wages and reduction of hours of labour; so have the farm labourers of Newbury; and even the washerwomen and monthly nurses of Padiham, near Blackburn, have announced that in future they must have better pay for their services. The saddlers and harness-makers of Glasgow, we see, have held meetings, and ask a rise equivalent to 15 per cent., and a turn-out is threatened.

We are glad to be able to announce the close of the Sheffield file-makers' strike, after a duration of nine weeks. The terms are, that the men withdraw all opposition to machinery, and that a joint committee of masters and men enter fully into the question of wages, to see what advances the condition of the trade will admit of. They are to report on this matter in three months, and meanwhile work is to be resumed on the old terms.

The Liverpool town council have refused to instruct the Improvement Committee to report on the subject of sites for improved dwellings for the working classes. We are sorry to hear it. Liverpool is rich enough to take the lead in a good work.

On this subject Mr. Lowe gave utterance to a phrase which will not soon be forgotten. He said, in reference to the picture of working men drawn by Mr. T. Hughes—"they insist that the money of their fellow taxpayers ought to be spent in building them houses to live in, because, forsooth, it is not fitting for them to pay sufficient out of their own earnings for the purpose." Working men insist on nothing of the kind. They are driven from their homes by the schemes of capitalists, and, if weekly tenants, have no sort of compensation. What they ask is that capital shall be furnished to provide new and wholesome homes, for which they are perfectly willing to pay a remunerative rent. Working men cannot raise stacks of buildings for themselves; but they can and will do what capitalists themselves do—pay a good interest for money advanced to provide for their requirements.

Co-operative Intelligence.

Tanfield District Industrial Provident Society.—At the twentieth quarterly meeting of the above society, after deducting working expenses, interest, and a good reduction of fixed stock, a dividend of 2s. in the pound on members' purchases was declared.

Ashton-under-Lyne.—At the recent quarterly meeting of the Co-operative Society here, the secretary read the thirty-sixth quarterly report, from which we extract the following observations and figures:—"The total receipts for the quarter over the counters have been £1,693 18s. 11½d., which gives a weekly average of over £130 6s., and shows an increase of £158 7s. 6½d. over those of the preceding quarter. By contributions, £140 19s. 1d., being greater by £46 8s. 4d. than the amount received in the previous three months. The amount withdrawn has greatly exceeded that of last quarter, yet the capital of the society remains unimpaired, it being greater by £69 8s. than it was in December last. Forty-five new members have been enrolled, while only three have withdrawn, from change of residence, making a net increase of forty-two members. The reserve fund has advanced £5 2s. 9d. A banking account has been opened, and £300 has already been deposited therein, which will give the committee a considerable advantage of any sudden change in the markets."

East London Co-operative Provident and Industrial Society (Limited), 2, Ocean Street, Bull Lane, Stepney.—From the twenty-fourth quarterly report, ending March 27th, 1866, we learn that the total cash received for goods was £513 7s. 3¾d.; the gross profit, £52 15s. 10¼d.; expenses, £24 9s. 9d., or 11¼d. in the pound on the goods, leaving a balance disposable of £30 12s. 9½d., which sum, after paying the various items to fixed stock, interest on shares, &c., enables the committee to declare a dividend of 1s. in the pound.

Saddleworth Industrial and Benevolent Co-operative Society.—At the thirty-seventh quarterly meeting, the secretary read the report, which shows that the society is in a very healthy and flourishing condition. The total amount of receipts during the quarter is £2,001 9s., being an increase of £588 16s. 5½d. over the corresponding quarter of last year. Amount of assets, £3,339 5s. 4½d.; amount of liabilities, including depreciation of fixed stock, £3,123 12s. 2d., leaving a clear profit of £215 13s. 2½d., which enabled the committee to declare a dividend of 2s. 3d. in the pound on the members' purchase-money. The amount of share capital credited to the society is £3,033 1s. 7d., being an increase during the quarter of £423 4s. 8d. The amount of cash in hand and in the bank is £1,218 2s. 8½d.

Darwen.—Quarterly Meeting of the Industrial Co-operative Society.—At the twenty-first quarterly meeting of the Over Darwen Industrial Co-operative Society, held in the United Methodist school-room, the secretary read the report, which went to show that the society was steadily increasing in numbers, also prosperous in its finances. The sales at the centre and branch stores during the past quarter amounted to £8,516 3s. 11½d., being an increase of £373 4s. 11d. on the previous quarter. The profits made by the same were £738 7s. 3d., which, after depreciating fixed stock and buildings to the amount of £27 1s. 7d., paying interest on capital at £5 per cent., with other incidental expenses, £25 10s. 8d. also added to the reserve fund, a dividend of 1s. 8d. in the pound was declared on members' purchases, and a bonus of £15 0s. 0½d. amongst the non-members. During the past quarter the contributions have been £1,419 6s.; the withdrawals, £353, 17s. 8d.; thereby showing an increase to the amount of £1,065 8s. 4d. The increase of members during the quarter is 92, the present number being 962, with claims as per ledger of £7,686 7s. 6d.

General Information.

CLUBS AND INSTITUTES.

Leicester.—The club here opened on Easter Monday, April 2nd, with upwards of 350 members, who have taken out their cards and paid their subscriptions. The committee have expended the donations for fitting up the premises as economically as possible, compatible with the convenience, comfort, and entertainment of the members; many things are left undone until the funds warrant the committee in expending the necessary moneys. About £100 has been given in donations, and the committee would be glad to raise about £40 additional to carry out their intentions. The next important thing is to cover in the skittle-alley, and light it up in the evening, and provide a few more tables for chess and draughts.

Workmen's Clubs and Institute Union.—The second social meeting held under the auspices of this society took place on the 25th instant in the lower room of Exeter Hall, Lord Lyttelton presiding. The question for the evening was the reduction of the franchise, and in opening the discussion his lordship briefly adverted to the Government measure, but he declined to say whether he would support it or not, supposing it should ever reach the House of Lords. He could only say, "Time will show." Mr. Cyrus Symons, a working man, delivered an address, contending that a large extension of the franchise would promote the well-being of all classes of the community. He approved of fixing the limit at £7, and said one good effect he anticipated from giving working men a chance of getting into Parliament would be the example of brevity they would set in their speeches. There had already been too much talk on this question, and the debates generally required shortening. In the discussion which ensued, the Government Bill was generally accepted, and it was urged that the only remedy for corruption was the ballot. Mr. George Brook, of the Reform League, one of the speakers, assured Lord Elcho, who sat in the body of the meeting, that his explanation at St. Martin's Hall had given much satisfaction to the working classes. Another speaker hoped the end of the week would see Mr. Gladstone's measure passed with a "crashing" majority, and that the House of Lords would follow suit. The noble chairman, in reply to this remark, said he thought if the Bill came up with a "crashing" majority their lordships would think twice before they threw it out; but if it did not it would be another matter. Lord Elcho, responding to an appeal made to him, said he was a subscriber to the institution, believing that it would be the means of doing a great deal of good; and he had attended in the hope of learning the views of the working class upon this question, which, it was said, were not understood in the House of Commons. He had listened with the utmost attention to what had been said, and, with the exception of the argument that the franchise was to be an educational instrument, he had heard nothing to support the proposition which had been advanced. It had been argued that, by lowering the franchise, the man was to be raised; but his view of the matter was, that it was most desirable the man should be induced to work himself up to the franchise. The debate terminated with a vote of thanks to the noble chairman, who was accompanied by his relative, the Earl of Lichfield. A vote of thanks to the chairman was also proposed by the Earl of Lichfield, seconded by Mr. Solly, and carried unanimously.

Radstock Working Men's Hall and Institute.—The ceremony of laying the foundation-stone of this building was performed on Tuesday, the 24th ult., by George C. Greenwell, Esq., C.E., F.G.S., formerly manager of the extensive collieries at Radstock, Somerset, belonging to the Countess Waldegrave. The day was beautifully fine, and a large concourse of people assembled on the occasion. The proceedings commenced by singing a hymn, after which the Rev. R. Elmore, at present acting for the incumbent of Radstock, offered a prayer. One of the oldest and most respected workmen in the collieries then addressed the people, expressing the pleasure the working men of Radstock felt in the prospect of having such a building for their use, and in welcoming their old manager once more among them to officiate as head bricklayer. He concluded an able and energetic address by presenting Mr. Greenwell with a beautiful silver trowel, purchased by the colliers, and on which was engraved a gratifying inscription, showing how, in the course of his nine years' management of the works, Mr. Greenwell had won the confidence and affection of the men under him. That gentleman then returned hearty thanks, and wished them much benefit and happiness from the proposed Hall and Institute. The Rev. H. Solly, of London, then delivered a short address, and the meeting separated. At five o'clock, a crowded tea-meeting was held in the National School-room, at which Mr. Elmore presided, and addresses were delivered by that gentleman, the Rev. H. Solly, and the Rev. Mr. Gale, incumbent of Foskett. Cordial votes of thanks to the chairman and Mr. Solly were moved by J. McMurtrie, Esq., present manager of the collieries, and carried amid acclamation. Mr. McMurtrie is earnestly helping on this good work, and bids fair to be as useful and popular among the honest subterranean workers of Radstock as his predecessor. It is a good sign of the times when relations of this kind are established between employers and employed. Another interesting fact connected with this undertaking is that many of the men themselves are contributing comparatively large sums out of their wages towards the erection of the Hall, and those who can, are giving help in labour. A donation from Mr. Greenwell of £20 was announced in the course of the evening. The Countess Waldegrave and her husband, the Right Hon. Chichester Fortescue, M.P., have each contributed £100 towards the erection of the building.

District Union of Metropolitan Working Men's Clubs and Institutes.—The conference announced in our last number to take place between representatives of the London clubs and members of the council of the Parent Society was held on Thursday evening, at the office of the latter, 150, Strand, when about twenty persons, including members of the following clubs, were present:—Camden Town, Chelsea, Child's Hill, Clerkenwell, Hampstead, Hackney, Paddington, Southwark, Shoreditch, St. Bride's, and St. James and Soho. A. H. Layard, Esq., M.P., occupied the chair, and after a full discussion it was unanimously resolved, on the motion of Hodgson Pratt, Esq., seconded by Mr. Wyeth—that it is desirable that a District Union of Working Men's Clubs and Institutes within the metropolitan districts should be formed on the plan recommended by Mr. Solly, Mr. Bainbridge, and Mr. Pocklington. Mr. Layard warmly supported the proposed organisation, which, he thought, would be productive of great benefits in various ways. A full account of the plans proposed will at once be printed and sent to the various London clubs. It was agreed to convene a second meeting of representatives of these clubs, and then to lay before them the proposed constitution, objects, and rules of the District Union for final consideration and adoption. This meeting is to be held on Tuesday, May 14th, at the office of the Union; tea at seven p.m., and business to commence at eight, when it is hoped that Mr. Layard will again be able to preside. A cordial vote of thanks to that gentleman, as chairman, concluded the discussion. Great help, it was unanimously agreed, may be seasonably rendered by Working Men's Clubs to one another, and much mutual benefit experienced, by co-operating for entertainments, exhibitions, lectures, discussions, excursions, matches of various kinds, interchange of privileges of membership, circulating libraries, and so forth. It is sincerely to be hoped that these good results may be secured, not only by a union of London clubs, but by similar District Unions throughout the country.

Correspondence.

*** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE CASE OF RAILWAY WORKMEN.

To the Editor of the Working Man.

Sir,—As your columns seem open to suggestions for the benefit of working men, not only from themselves, but also from others who may mix among them and be aware of matters affecting their interests, I beg to trouble you with some inquiries relative to the condition of railway workmen.

Travelling a good deal about, I often hear complaints from railway porters and platelayers as to the great duration of their hours of labour, and the moderate wages they receive. What are the actual facts of the case? What have these workmen themselves to say? Would they write to you letters which might be published, either affixing their own name or sending to you privately their names and addresses, as a guarantee of good faith, explaining what their actual condition is, that the public may judge whether their complaints, or such as are made on their behalf, are well founded? If there be a grievance, they should know it; and if it is to have redress, they must tell it. As I observe that the Working Man reaches this class of persons, this notice of interest as to their social and industrial position might elicit some facts upon which an opinion can be formed. I observe that when an inquiry was lately made on behalf of letter-carriers, as to whether their wages should not be increased, the curious answer given was that there was competition for their places, and therefore there was no need to increase their wages, however otherwise well deserved. In the public service the object ought to be to command good services, and to pay such a rate of remuneration as will enable that service to be given—viz., prices to ensure it.

The case of railway labourers, porters, platelayers, and others seems yet stronger. The postman has our property in his hand; the railway workmen have our lives. Inadvertence, incapacity, or fatigue from over-work may lead, as it often has led, to a frightful catastrophe, which no award of juries can undo. It might be a matter of economy, as well as humanity, to command vigilant services, by shorter hours of duty or higher wages. Perhaps we shall learn how the matter stands from the parties themselves more immediately concerned, if you deem this letter of sufficient interest to insert.—I am, Sir, A Travellee.

Rugby, April 25, 1865.

[Some time ago we directed inquiries to be made upon this very subject, and we expect to have some special facts to lay before our readers. In the meantime, the suggestion of our correspondent may prove a useful auxiliary; and we shall be glad to record any results which may be communicated to us.—Ed. W. M.]

MR. CLAY'S EDUCATIONAL FRANCHISE BILL.

To the Editor of the Working Man.

Sir,—As I have been a reader of your new publication since its commencement, and I have read the correspondence which has been inserted from time to time in your columns on Mr. Clay's Educational Franchise Bill, and if I am not too late, I should like to state very briefly my opinions on the same subject. I am of opinion that the educational test as proposed by Mr. Clay is far preferable to the present system, which requires a £10 household qualification; but I think for Mr. Clay's Bill to have recommended itself to the great body of the people, it ought to have been prepared as a substitute for the present system, and not merely as an addition to it. I cannot, as has already been expressed by other of your correspondents, see why working men, in order to obtain the possession of the franchise, should be compelled to become, to a certain extent, intellectual, while others, because they are possessed of a few bricks and mortar, should be entitled to vote, although they may be as ignorant as it is possible to be in a civilised country. I am a firm believer in one common qualification for *all* classes—namely, registered manhood suffrage. My own opinion is that every man, whether he comes up to Mr. Clay's standard or not, who is twenty-one years of age, and of sound mind, and unconvicted of any crime against the laws of the country, and can show that he has resided in any given place the preceding six months, is—or, at least, ought to be—entitled to be put on the register as a fit and proper person to vote for a member or members of Parliament; for I hold that every man who is called upon to obey the laws and to pay taxes (and who is there among the working classes who does not contribute to the support of the State?) ought to have a voice in making those laws, and in saying how those taxes shall be expended. I think it is very absurd to say that because a man does not pay an annual rent of £10, or has not £50 in the savings bank, or because he does not come up to Mr. Clay's test, he has no interest in the country. Every man has the interest of his own existence, and ought to have a voice indirectly, at least, to plead for it in the British House of Commons. Before I conclude allow me to say that, in my opinion, no Reform Bill can be satisfactory that does not protect the voter by the ballot. It is all very well in its way to say that working men *ought* to be independent, but it is not only *working* men who, under the present system, require protection, but thousands of small tradesmen as well. Therefore let the suffrage be of what kind it may, without the aid of the ballot it would be rather a curse than a blessing, for I am persuaded that at the present time it is often looked upon as such by its possessor. Trusting you will insert the above as the honest opinions of a working man, I beg to remain, yours, &c., W. Morley.

Old Basford, near Nottingham.

WORKMEN AND TRADE SOCIETIES.

To the Editor of the Working Man.

Sir,—I avail myself of the invitation you have given to working men's contributions on subjects which interest them. Such contributions may be of little value in a literary point of view, but they cannot fail to possess some of that value which is frequently above all others—namely, the practical experience of the writers.

The working man, candidly and intelligently depicted by his own hand, would be a very different being from that fanciful delineation which we sometimes have from platform orators. No doubt, when they clothe the working class with high intelligence and many virtues, they speak to the extent of their knowledge, and believe what they state; but they would be completely cured of their error if they could be prevailed upon to spend a few months among the workshops, and be obliged to mix with the society and mingle in the conversation they would find there. The high encomiums which these partial friends of the working class frequently bestow are well and worthily deserved by many individuals in every trade; but their number, compared with the whole, is as yet but a drop in the bucket—too few to have much influence, either in the workshops or Trades' Unions; though, owing to good and cheap literature, that number is daily increasing. It would be well, too, if these fanciful friends of the working class would descend to the sphere of the Trades' Union for a little while, and practically learn from the proceedings, the management, and the views expressed there, what is the actual character of the working class with reference to information, intelligence, and self-respect. Any observer who has failed to gain a thorough knowledge of life in the workshop and Trades' Union can never have a correct estimate of the doubtful principles, the mean, narrow views, and general ignorance which mark many of the operatives. It is unfair to judge of what is seen at Working Men's Colleges or Literary Institutes, for at these places the best of every trade are drawn together by a similarity of tastes and desires. If it be thought that these views are rather crabbed and capricious, an appeal to every autobiography that has been written by working men, from Benjamin Franklin to the present day, would set the matter at rest. It is true that drunkenness, and the more brutal habits and pastimes, have abated in late years: yet every thoughtful and candid workman will acknowledge that the workshop description of Hugh Miller, "One who has Whistled at the Plough," and the talented printer, who has written "The Working Men's Way in the World," are veritable transcripts, and, though slightly modified by circumstances, are recognisable every hour of the day.

It is to be expected that, whatever societies are organised by workmen for the furtherance of their interests, such societies will, in a great measure, reflect the moral and intellectual characteristics of the majority of those who compose them.

Trades' Unions have never had the approbation of public opinion, because, as a body, they have never done anything to deserve it. Some have had its reprobation for acts that can never be justified, while few have done much towards a realisation of their professed objects. But the most remarkable thing is, they remain a permanent institution among all classes of workmen. They are to be found as far back in the history of labour as the beginning of the sixteenth century; and, from the tenacity with which they are clung to, it is fair to infer they will exist as long as the present relation between capital and labour remains unchanged. They are not only a permanent institution, but they are, also, an unchanging one; for their objects, and the means to accomplish them, remain the same at the present day as they were 300 years ago. Now, ought this to be? Amidst all the great improvements in the sciences and the arts; amidst the great diffusion of intelligence and light everywhere around us, cannot one single ray penetrate the darkness and fructify into life the seed which is assuredly there? The Chinese-like immobility of the Trades' Unions is surprising. Their professed objects are to keep up the rate of wages and preserve the personal independence of the workman—objects in themselves perfectly legitimate; but they have made no adequate provision for carrying out these objects. Wages cannot be advanced or depressed at will: there is a law pervading this subject, which must be known and attended to before a right conclusion can be drawn. And how can it be expected that anything like a correct idea of the relationship of wages and profit, and of both to production, can exist, when the people judging of them are utterly ignorant of the first principles of economic science, and who labour under delusions so gross, that if the words "political economy" are but mentioned among them, they are received with alarm and derision, as if an enemy were about to be introduced into the camp. And if the object of personal independence is to be sustained, there are no better means of doing so than the individual showing by his conduct that he possesses straightforward and correct moral principles, rectitude in his business dealings, and self-respect throughout his whole bearing.

It follows, then, that an educative object, incorporated with the objects of a Trades' Society, becomes an imperative necessity if they are to be anything else than they have been—mere engines of vulgar force. Let us see what efforts and changes are necessary to effect the very simple but important reform of associating the advantages of a literary with those of a Trade Society.

The first thing to be done is to get out of the present places of meeting, the public-house; for the fact of associating public business with drinking and smoking will stifle in its birth any project of reform. There is no occasion for the members to become teetotalers to do this—no reasonable person would expect such a wholesale change of habits. All that is wanted is a practical acknowledgment that public business can never be efficiently done if associated with conviviality, for conviviality will always get the upper hand of business in the long run. Many of the questions that are continually coming before a Trade Society, if properly treated, require a knowledge of economical and other principles, and their application again requires concentrated attention; but it is out of place to expect either amid the brawling which is ever concurrent with the fumes of "the pot and the pipe."

To make a beginning, small societies might rent the floor of a private house as a place of meeting. Large ones require more convenience, the ways and means to obtain which would soon appear by an earnest and well-directed business effort; and all societies might have a few shares in a building society, and so, in course of time, have premises of their own. It may be said the public-house is advantageous as a place of meeting, because it is always free to the members without the payment of rent; but there lies the fallacy, for it stands to reason that the landlord cannot afford the use of his rooms except the profits of the spendings there are sufficiently remunerative to him; and if an account were kept of the sum spent to make that profit, it would be found a heavy rent indeed. If the place of meeting were removed to a private house, the attainment of every other object would be comparatively easy.

A library could be formed without much expense: the foundation of one might be laid by every member presenting a volume; and the best disposed among the employers would readily contribute in support of such an object. Classes and lectures at stated intervals would be within the pecuniary reach of most societies. And surely it is a consistent and necessary thing that an organisation of workmen for trade purposes should teach and endeavour to perfect its members in the principles of the art by which they gain their livelihood. Engineers, carpenters, and others must be more efficient, both in head and hands, when instructed in the principles of mechanics, geometry, and drawing. A knowledge of the elements of chemistry is serviceable in other trades; and so on with various sciences, through the whole range of handicraft. The working men would find that such elementary instruction, if anything like general, would also be a wages-raising principle; their tastes and self-respect would be raised, a higher and more refined standard of living would be desired; and the public opinion of the upper and middle classes would be conciliated in their favour. The usual complaint, that the really intelligent portion of the working class take no leading part in Trade Societies, would be obviated; for they would naturally take the foremost place among classes and books, and when information was wanted. But, as Trade Societies are at present constituted, they make no demand on any man for information or intelligence; hence, their affairs are frequently in the hands of drivellers or presumptuous brawlers, who have nothing to recommend them but their obtrusiveness and vulgar prejudices.

There are already a few Trade Societies organised with an educative principle, and many workmen in various trades have favourable opinions of such a movement, but they have not sufficient energy to step forward and take the initiative in the matter. Their hands, however, would be strengthened by a little extraneous aid in the shape of the advice and influence of some of those practical philanthropists who have organised Working Men's Colleges and Clubs. These institutions are doing, and will do, an amazing amount of good; but they cannot reach the great body of the workmen—they can but draw off the best and most tractable among them, leaving a gulf, as it were, between them and those who are not favoured with such a correct turn of mind. But if the affairs of a Literary Society were mixed up with a Trades' Society, all would feel an interest and be constrained to partake of the benefits. And there would be no fear of such societies coming to an end when the fostering hand of the philanthropist was removed, for it is as much in the nature of a Trade Society to be permanent as it is in a literary one to be wisdom-giving. P.

TO CORRESPONDENTS.

Watson.—The india-rubber is first softened in benzole, and afterwards dissolved in camphine, or in sulphide of carbon; or it may be wholly dissolved in benzole. The smell is removed by suspending the goods in hot-air chambers.

Truro, W.—Gold lacquer for brass consists of alcohol, 1,000; shell-lac, 180; fused amber, 60; gamboge, 6; extract of red sandal-wood, 1; dragon's blood, 35; saffron, 2; powdered glass, 120 parts—grains, ounces, or pounds.

Bolton, W.—The blasting powder patented by Mr. Ehrhardt is composed of chlorate of potassa, ½ lb.; nitrate of potassa, ½ lb.; tannin, 1 lb.; charcoal, 2 lb.

Parkesine.—Our articles on Electrotyping will supply you with all the information desired.

C. T. T.—Silvering by Drayton's process is simple and sure. It will be described in an early number of the Working Man.

W. E. C.—See reply to Parkesine above.

A Miner.—"The Mines' Act," 23 and 24 Vict., c. 151, provides that no boy under twelve is to be employed in any mine or colliery, unless he has a certificate from a competent schoolmaster that he can read and write. With this certificate he may be employed at ten years of age. But a boy may be employed, if ten years of age, if the proprietor obtains a certificate that he attends school for three hours on each of two days every week. Women and girls are prohibited from working in mines and collieries by the 5th and 6th Vict., c. 99. False certificates render the giver liable to a penalty of not more than £10, or less than £5.

Saws same make, Second Quality (by some called best) of each of the above, 1s. less.

Carriage Free (if to the amount of 40s.) on receipt of Post Office Order, or postage stamps.

N.B.—These Saws are the same make as those that have given such great satisfaction for the last forty years.

Notice.—Messrs. Moseley and Son beg to announce that, in order to enable Country Workmen and others to obtain their superior Tools and Cutlery, they are now prepared to forward, direct from their Establishments, Parcels to the amount of £5 and upwards, to any part of the Kingdom, Carriage Free. Cash by Cheque or Post Office Order.

Moseley's Patent Electric Bells, Railway Signals, &c. Superior Galvanic Machines, from 18s., &c. &c. These machines are strongly recommended by the faculty for the cure of Rheumatism, &c. &c. [23

LEATHER, UPPERS, AND SHOE MERCERY.

J. W. McLellan, Leather Merchant, 47, Lambeth Walk, S., has one of the largest and cheapest stocks in London.

Prime 36 lb. Buenos Ayres butts, 1s. 6d. per lb. Prime 32 clean foreign, 1s. 3d. per lb. A very prime lot of enamelled seals, 4s. per lb. Men's and Women's soles, 1s. 4d., 1s. 6d., 1s. 8d., 2s. Scotch hides, 1s. 10d. per lb. Elastic webs, direct from the loom. Price List free by post.

KIT AND GRINDERY, WHOLESALE AND RETAIL.

Superior Brads, French and STEEL, 7 lbs. for 1s. 1d. Superior ink, 9d. per gallon. Copper toes, 2s. 2d. per doz. Men's iron-bottomed lasts, 2s. per pair. 20 lbs. clean English butts, 1s. 6d. per lb. Agent for Pront's Dubbin. 21 best plates, 5s. 6d. per gross. Scotch hemp, 2s. 7d. per paper. A liberal discount to all purchasers over £1, at I. W. McLELLAN'S, Lambeth Leather Warehouse, 47, Lambeth Walk, S. [24

PRICE TWOPENCE.

Upright Shoemaking. An ADDRESS TO WORKING SHOEMAKERS AND OTHERS ON THE EVILS OF THE "SEAT," AND THE ADVANTAGES OF THE "UPRIGHT BENCH;" with a few Practical Hints to Persons interested in the Promotion of Industrial Schools and Reformatories. By J. Sparkes Hall. Sent for three stamps to any address.

Magic Photographs.—Surprising and interesting amusement. Every one is able to produce with a few drops of water an instantaneous photograph. 1s. the packet, with printed instructions, or post free for 13 stamps, from the Manufacturers and Patentees, Messrs. ANGERERS, SON, FRUWIRTH, and Co., 146, Cheapside, E.C.

Magic Portraits. "Any child can astonish the family."—See *Standard.*

Magic Portraiture.—To be enabled to produce your OWN PORTRAIT by Magic Photography, with a few drops of water only, causing endless fun and amusement, send your carte de visite and 30 stamps to Messrs. ANGERERS, SON, FRUWIRTH, and Co., 146, Cheapside, E.C. One dozen with materials and printed directions for instantaneous production will be returned with the original within ten days. 4

£20,000 ready to be advanced by the TEMPERANCE PERMANENT LAND and BUILDING SOCIETY, on Freehold or Leasehold Property, for any period of years not exceeding fifteen, the mortgage being redeemable by equal monthly instalments. Interest (in addition to a small premium), 5 per cent. on the balance each year. Apply to

HENRY J. PHILLIPS, Secretary.

Offices, 34, Moorgate Street, London, E.C.

Note.—More than half a million pounds sterling have been advanced upon house property alone. [27

The Operatives' House BUILDING COMPANY (LIMITED). Established to provide Improved Dwellings for the Working Classes.

Working Men's Societies are invited to communicate with the Secretary, at the Company's Office, 10, John Street, Adelphi, W.C., where Prospectuses may be had.

W. H. ROBINSON, Secretary. [1

How to Purchase a House for Two Guineas per Month, with Immediate Possession, and No Rent to Pay. Apply at the office of the Birkbeck Building Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO PURCHASE A PLOT OF LAND for 5s. per Month, with Immediate Possession, either for Building or Gardening Purposes. Apply at the office of the Birkbeck Freehold Land Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO INVEST YOUR MONEY WITH SAFETY, at £5 per Cent. Interest. Apply at the office of the Birkbeck Deposit Bank. All sums under £50 repayable upon demand. Current Accounts opened similar to ordinary Bankers. Cheque Books supplied. All cheques exempt from Stamp Duty.

Office Hours from Eleven till Five daily; on Saturdays from Eleven till Two, and on Monday evenings from Seven till Nine.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to

FRANCIS RAVENSCROFT, *Manager.* [28

The Planet Permanent Building AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,381. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [29

Inventors Assisted in Securing, Carrying Out, and Disposing of their Invention. Apply to B. BROWNE and Co., British and Foreign Patent Office, 49, King William Street, London Bridge. A Pamphlet, gratis, on Cost of Patents, may be had on application. [30

Inventions Protected by Patent OR REGISTRATION at fixed and moderate charges. The "Inventor's Manual," free by post, or gratis on application. Apply to Mr. Brewer (late Barlow and Co.), 89, Chancery Lane, London.—Established Twenty-one Years. [31

The Best Remedy for Indigestion, Bilious and Liver Complaints, FRAMPTON'S PILL of HEALTH.—Sold by all Medicine Vendors, at 1s. 1½d. and 2s. 9d. per box, or obtained through any Chemist. 3

EASY MODE OF PAYMENT.

Every Description of General DRAPERY, TAILORING, AND OUTFITTING, At Moderate Prices.

Terms: One Shilling in the Pound per Week.

George Peabody.

THERE was something exceedingly appropriate and graceful in the idea of inviting Mr. George Peabody to preside over the closing ceremony of the City of London Working Classes' Exhibition, for there are few men who have done more to gain the respect and esteem of the artisan classes than the man who has so nobly devoted such a princely portion of his fortune to the furtherance of a scheme having for its object the improvement of the homes of the people. The Peabody Model Buildings will ever remain a monument of the practical benevolence of their founder. Unlike many of those who have sought to ameliorate the condition of their poorer brethren, he was enabled to discriminate between real and false charity. He knew that the safest and most serviceable aid he could render to working men was not in treating them as paupers or suppliants for charity, but as men who, against heavy odds, were endeavouring to help themselves. The great difficulty with which the working classes of London have to contend in obtaining proper dwellings is the enormous value of land in the metropolis—a difficulty which, in some instances, is at present beyond the power of working class co-operation to surmount. This obstacle George Peabody determined, so far as in him lay, to remove, by providing a fund for the purchase of land and the erection of suitable dwellings thereon for use, at a moderate rental, by the working classes, who otherwise would have to content themselves with far inferior habitations at a much higher rental. This was really practical help, and of a self-supporting character too.

But George Peabody came of a practical race. The Pilgrim Fathers were men who dared to become voluntary exiles rather than renounce the opinions which they had learned to regard as true; and from these men of iron will and indomitable purpose, George Peabody has inherited much of that calm and persistent resolution which has enabled him to successfully carry out his intentions. Born at Danvers, in Massachusetts, he commenced his commercial life in the city of Baltimore, where every scope was afforded for the display of his shrewd and discerning powers. From an early period he commenced that career of magnificent liberality which has culminated in the splendid and almost regal gift to the poor of London. He made wealth, not to enrich himself, but to bestow it upon others.

In 1837, he left his native country—the land of the stars and stripes—and came to London, where he founded the great American banking firm known throughout the whole civilised world as Peabody and Co., and which for eight-and-thirty years has had a most profitable and flourishing business.

But, in his adopted country, Mr. Peabody did not forget the claims of his native land. During a visit to America, in 1852, he gave 100,000 dols. to found in the town wherein he was born an educational institute and library, "the results of which," he stated, "have proved most beneficial to the locality, and gratifying to myself." In 1857, he generously devoted no less than 500,000 dols. to the erection of an institution for the promotion of science and art in Baltimore, the city in which he commenced his commercial life. But his chief munificence was reserved for England—the country in which his fortune had been amassed, and of whose commercial fabric he was one of the principal ornaments. When the extent of his gifts were first made known to the people, they could scarcely resist being incredulous. Such princely presents are somewhat rare in the history of nations; and it is not every man who makes a fortune who thinks of bestowing it upon others. In this respect, George Peabody has furnished a brilliant precedent for future millionaires—less, however, in the magnificence of his gift than its practical character. If his intentions are faithfully carried out, great and appreciable changes will take place in the condition of the London poor. The Peabody buildings will form the leaven which will alter the whole mass of house accommodation in the metropolis. Working men will no longer be content to be slowly poisoned to death in pestilential, reeking abodes, while landlords will find it to their interest to provide their tenants with homes more fit for the use of human beings, and less deserving of that censure and reproach which so many of them have incurred. This is the peaceful revolution designed by the people's benefactor, George Peabody.

GEORGE PEABODY, ESQ.
(*From a Photograph by M. Claudet.*)

Well did the Queen, with her womanly instinct, gracefully interpret, in her kind-hearted and noble letter to Mr. Peabody, the universal sentiment of the country. It is by such recognition of the really great deeds of large-minded and unselfish men, that royalty manifests its true dignity, and gains for itself that national respect and love—that undying popularity — which is stronger far than fleets and armies, and which never fails a ruler in the hour of need.

In America, to which country Mr. Peabody has temporarily returned, the presence of the great benefactor will be hailed as that of one who has done much to cement the feelings of mutual good-will which ought always to subsist between the two principal branches of the Anglo-Saxon family. Englishmen will always honour America as being the birthplace of one who has shown such devotion to the claims and interests of the labouring classes, while in America the name of Peabody will be regarded as that of one who has caused the name of his country to be spoken of in tones of esteem and gratitude in the homes of the mother-land.

SOUTH KENSINGTON.—The art-schools at South Kensington have been better attended during last year than ever before; consequently, the receipts from students' fees have been proportionally increased. More than £2,000, being an increase of nearly £200 over the amount received last year, has been paid on this account. The actual results in respect to employment obtained by students who have been trained in these art-schools have been more than usually satisfactory during the official year 1865. Of the holders of national medallions, the following are designated as having obtained good and regular employment:—Mr. Gundry, at Northampton, as a designer for iron-work; Mr. Brophy; Mr. Fildes, with Mr. Thomas, wood-engraver; Mr. Harris, with M. Helbronner, Regent Street.

FRENCH LOCOMOTIVES.—"The manufacture of locomotives in France," says a Paris letter, "is daily increasing to a great extent. Our great manufacturer, Koechlin, gave, a few days back, a dinner to his workmen on the completion of his one thousandth locomotive."

*The Origin and Uses of Trade Guilds.**

In the long reign of Edward III. both commerce and the arts flourished with new vigour. The sagacious monarch saw the advantage of encouraging the various companies which were the mainstay of the trade of the kingdom. To all those of importance he gave charters for the exercise of their privileges, which before were only held on sufferance, or by payment of certain fees. The guilds were now more often termed *crafts*, or *mysteries;* and as they began to assume a distinctive dress or livery, they were also called livery companies.

But a still higher mark of favour was afterwards bestowed upon the trading societies by the king. In order to raise them in public estimation, he resolved himself to become a member of one of the fraternities. The Linen Armourers, now the Merchant Tailors, was the company selected for this honour. They were at that time the chief dealers in woollen cloth, which the king sought to make the staple manufacture of the kingdom. His example was followed by his courtiers, and it soon became fashionable to belong to one or other of these bodies. Besides the Merchant Tailors, the Skinners, the Mercers, and the Grocers were particularly selected for this distinction. None, however, was so highly honoured as the first-named society. Richard II. followed the example of his grandfather in joining its ranks, and there were, besides, on its lists four royal dukes, ten earls, ten barons, and five bishops.

These were flourishing days for the trading companies; but their powers appear at times to have led them into excess, and it was, even at this early period, often complained that the monopoly enjoyed by the various associations was prejudicial to the public interest. In the thirty-sixth year of Edward III. a petition was presented to the House of Commons, seeking to limit the monopoly of the Grocers. The reason why they bore this name appears from the wording of the petition. It states that "great mischief had newly arisen, as well to the king as to the great men and commons, from the merchants called *grossers*, who engrossed all manner of merchandise vendible, and who suddenly raised the price of such merchandise within the realm; putting to sale by covin, and by ordinances made amongst themselves in their own society, which they call the Fraternity and Guild of Merchants, such merchandises as were most dear, and keeping in store the others until times of dearth and scarcity." The petition went on to suggest that in future every merchant should be restricted to dealing in one class of merchandise only.

This suggestion was adopted in an Act of Parliament passed in the following year. The Act decreed, amongst other things, that "all artificers and people of mysteries shall each choose his own mystery before next Candlemas, and shall henceforth use no other." Infringement of the Act was to be punished by six months' imprisonment. Women artificers, who at this time were numerous, were exempted from its operation. In the following year the Act was repealed, so far as it related to the merchants, but its provisions as to the artificers remained in force. We read of several freemen of London losing their privileges for following trades to which they had not been brought up. Among these were "John Lynn and Nicholas Merchant, who, being haberdashers, occupied merceries; William Southbrook, weaver, for that he occupied drapery; Geofrey Presbury, for procuring the freedom of the Haberdashers for a mercer," &c.

The trading companies had so far increased in the fiftieth year of Edward III., that the number sending members to the Common Council of the City of London was raised from thirty-two to forty-eight. At this time, not only were the Common Council elected by members of the companies, but also the City's representatives in Parliament.

The oath administered to the wardens and other principal officers was to the following effect, the language being modernised here:—"Ye shall swear that ye shall well and truly oversee the craft whereof ye be chosen. And all the good rules and ordinances of the same craft ye shall keep, and do to be kept. And all the defaults that ye find in the same craft ye shall well and truly present to the Chamberlain of the City, sparing no man for favour, and grieving no person for hate. Extortion nor wrong under colour of your office ye shall not do; neither to anything against the State, peace, and profit of our sovereign lord the king, or to the city, shall ye consent. For the time that ye shall be in office, in all things that shall belong unto the same craft, after the laws and franchises of the said city, well and lawfully ye shall have you."

Henry IV. both confirmed and extended the privileges of the companies. He made them bodies corporate with perpetual succession and a common seal, and gave them powers to have and to hold lands purchased or bequeathed. Husbandry in this reign was neglected for trade, until it became necessary to enact that artificers and "people of mysteries" should be compelled to serve in harvest, by cutting, gathering, or bringing home the corn.

In the reign of Henry V., an important change was introduced, at the king's suggestion, in the records of the companies' proceedings. Up to that time the language used for this and other public purposes was chiefly the old Norman French, with a mixture of Latin; but the common tongue of the people was now generally adopted.

The trading companies figure prominently in the State pageants of this period. When the king returned triumphantly from France in 1415, he was met at Dover by a grand procession, in which, we are told by an old poet—

> "The Mayr of London was redy bown
> With alle the craftes of that citie,
> All clothyd in red throughout the town;
> A semely sight it was to see."

At the same monarch's funeral they made an impressive appearance with torches and mourning emblems.

In the reign of Henry VI., a complaint was made to the king by the Commons against the trading companies. It set forth that "the masters, wardens, and commonalty of several guilds, fraternities, and other companies, incorporate in various parts of the kingdom," frequently made unreasonable ordinances under colour of their charters, as well as corrected offences, the punishment of which belonged only to the king or his officers; and also that they "confederated things for their own single profit, and to the common damage of the people." They prayed that all such companies should be required, by a certain day, to produce their charters before justices of the peace or governors of cities, for registration; and that henceforth they should be subjected to a penalty of £10 for exceeding, or acting contrary to, the powers they rightfully enjoyed. This very reasonable petition was granted.

Succeeding monarchs continued to bestow their favour upon the guilds. Henry VII. especially honoured them by becoming a member of the Merchant Tailors, and delivering that company a new charter from the throne; at the same time being himself clad in the livery of the company, made of the richest materials. He afterwards presided as their master, clothed in the same dress.

We must reserve our concluding notices of this subject for another paper.

* Continued from page 281.

*Window Plants and their Culture.**

Among hardy plants usually raised from seed, there is none more generally grown than mignonette. The best way in which to manage it, is to grow it into what is called a "mignonette tree." This is accomplished by cutting carefully out all the little branches which appear at the junction of the leaves with the stem. A sharp knife must be used, so as not to injure the leaves. The plant under this treatment runs up to a single head of flowers; cut them off as soon as visible, and allow the branch that grows from the top leaf joint to grow, training it to a thin stick. When about a foot high, in October, let the top branch out and flower, and, by judicious pruning, it will form a fine head of deliciously-scented flowers. In spring, it can be again pruned to one single stalk, and allowed to grow still taller. Thus treated, it will grow for years.

In beginning to treat of the culture of window-plants separately, the camellia is entitled to the first place, from the perfection of its form and beautiful colours. It is at all times an object of beauty from the richness of its evergreen leaves; but when its snowy white or bright rosy waxen flowers appear, it has hardly an equal.

The camellia was introduced into England in the year 1739 from China, by Father Kamel, from whom it has taken its English name. Like most of the plants which we have obtained from China, the camellia is nearly hardy. It has been grown through the winter in the open air, and with very little protection, will grow in the border; but the flowers, under this treatment, are not worth much. It can be easily grown and successfully flowered in the window of any room where the frost cannot get at it. The soil in which it succeeds best is composed of two parts good loamy earth and one part each of sand, peat, and well-decayed manure. As soon as the plants have done flowering, they must be repotted, if they seem to require it, that is, if the pot is filled with matted roots. If the roots are matted, it is better to break off the matted portions with the hand than to *cut* them off. As soon as they have been potted, they will require plenty of water until the new shoots have ceased growing. They ought to be in the warmest spot at command until they have completed their growth, always protecting them from the direct rays of the midday sun. To make room for other plants which will be in blossom, the camellia may be placed out of doors until September, when it is to be brought in and kept for the winter in any cool place where it will be free from frost. The flower-buds of the camellia are, when just expanding, very liable to drop off; this is caused by sudden changes in the heat of the room in which they grow, and by unequal watering. Let them be regularly watered, and, if possible, protect them from sudden alternations of heat and cold. Cuttings of the camellia can be struck at any time, except when the young wood is growing; but they grow most readily immediately after this period. Cut off the young branches, leaving them four or five joints in length; cut the bottom square off below a joint, and take off a couple of the lower leaves. Place the cuttings in sand and cover with a bell-glass, and in heat they will strike quickly.

The camellia, if it has plenty of light and air, is not subject to the attacks of insects to any extent. Sponging the large green leaves will be of great benefit to the plant, and will much improve its looks.

The camellia is constantly grown from seeds to obtain new varieties; but, as the seeds require two years to come up, and do not generally flower until the fifth year, it is a much better plan to procure plants or cuttings, than to wait for plants from seed.

The next place may be given to the fuchsia, which, from the elegance of its mode of flowering, and the ease with which it is cultivated, is in universal favour as a window-plant.

The best time to increase the stock of plants is in the spring, just as soon as the young shoots are long enough to be handled. Slip them off close to the main stem, and plant them round the edge of a four or five-inch pot. If they are kept, by means of a bell-glass, and a moist, warm atmosphere, from withering at all, they will be rooted in a fortnight or three weeks from the time they are put down. When they are well rooted, they are to be removed into separate pots (small ones); and, as they require it, remove them until they are in five or six inch pots, in which they will flower. The soil that suits them best is rich, loamy earth, with a mixture of well-decayed manure, and a very little sand to make the soil slightly open in texture. When the plants have done flowering, give them as much sun and air as convenient, so that the green shoots may be ripened well for the coming year. If convenient, they may be placed out of doors until the approach of cold weather. A little frost will not kill them; but it is much better to avoid the danger. Through the winter, the only attention they require is to keep the earth in the pots pretty dry, and to keep the plants from making new shoots. Of course, all the time, care must be taken to prevent the soil from drying entirely, and to keep them from frost. About March, they will begin to grow, when, if they require it, they may be shifted into pots a size larger, or have some of the old roots and earth rubbed off, and be repotted in the same pots, adding some fresh earth. As I have already

* Continued from page 259.

mentioned, the culture of the fuchsia from seed is simple, and is interesting from the chance it offers of raising new varieties. The most of the young plants will flower the first year. When the plants are going into blossom, an occasional watering with weak manure water will much improve the flowers.

Thomas Crowther, the Tape-sizer of Todmorden.

We recently reported, in the columns of the Working Man, a very remarkable speech delivered by a working man at a Reform meeting at Todmorden. Some of the principal metropolitan newspapers published the speech in full as a practical answer to the aspersions cast upon the working man, and the picture drawn of him by Mr. Lowe and some writers who, fancying that the labouring man was at a moral discount, appeared to think that there was a favourable opportunity of going with the stream—being "strong upon the stronger side"—and talked largely of the utter unworthiness of the working classes. The person whose speech was thus converted into a substantial argument, was Mr. Thomas Crowther, a working man, employed as a tape-sizer—that is, one who sizes warps for weaving—in a factory at Todmorden. The clear and even elegant style of the speech, the incontrovertible soundness of the arguments, and, above all, the temperate tone and entire absence of class animosity, at once turned attention to the author; and we propose, in a short sketch, to describe the career of one whom all right-minded and intelligent working men must feel to be an honourable representative of their order.

Thomas Crowther was born in Todmorden on the 25th of May, 1836. He was one of those waifs and strays of illicit love, who, unfortunately, figure so numerously in the returns of the Registrar-General as "illegitimate." His parents were extremely poor, his mother being a weaver in a cotton mill, and daughter of a journeyman plasterer, and his father a shoemaker. Soon after the birth of Thomas, his father went to America, leaving the burden of supporting the child upon the mother. She struggled well for seven years, and then died, leaving the boy to the mercy of the world. Her parents, though little able to bear additional expense, contrived to send him to school, more or less regularly, until he was thirteen years of age. His teacher was a self-taught factory operative—a man of intelligence, who did his best to impart to his willing pupil all the knowledge he himself possessed. We may suppose that his acquirements were not very extensive, as reading, writing, and arithmetic were all that young Crowther mastered under his tuition. When he left school he was taken on at the factory, and worked at the loom for upwards of ten years. His spare time was devoted to the acquisition of knowledge, and the few books he was able to collect were his chief companions. When about twenty-four years of age, he was promoted to the office of tape-sizer—an occupation frequently involving long days of work in a heated atmosphere. About this time he became generally known in the town as one of the most active members of the Todmorden Mechanics' Institution, where his remarkable power of speech was soon conspicuous. It was not, however, the sounding fluency of the mere debater which made Thomas Crowther's Institutional reputation; but his closeness of reasoning, tolerant spirit, and the healthy tone of his mind, which, in his case, had the invaluable assistance of ready speech and mastery of graceful and vigorous diction.

At the annual *soirées* of the Institution, Thomas Crowther was always the member selected to appear on the platform with men of far higher reputation—Members of Parliament, clergymen, literary men, and others, who by their presence on such occasions encouraged the members to persevere in the path of intellectual improvement. We have before us several reports of these interesting meetings; and it is not too much to say that none of the speakers were more eloquent and effective than the hard-working man, who had just changed his clothes of labour, and hurried from the factory to the platform.

Speaking in 1861, he said:

We have, I trust, got past the time when ignorance is regarded as a lesser evil and knowledge as at best but a doubtful good. The experience of past years has been sufficient to teach us that in an increase of knowledge lies our own best interest and our true national safeguard. The predicted days have come upon us when many shall run to and fro, and knowledge shall be increased; and in the dilemma which has thus been forced on us, we at least have been wise enough to perceive that our true policy lay in assuming the direction of a movement we could not avert, and by our Mechanics' Institution and other kindred means are seeking to direct the feeling into legitimate and useful channels, as at once better and safer than damming-up each outlet, when it would be sure to stagnate and poison till the body corporate became swollen to bursting with a moral dropsy; and we are now reaping the fruits of that wise discernment. While other nations are armed to the teeth, and yet find difficulty in maintaining order in their own provinces, when students are always suspected of treason, and universities are regarded as the hot-beds of sedition—we fear nothing from an increase of knowledge, nor need the voice of cannon to call forth our loyalty, but, as is shown in the calamity that has fallen on us, from the lowest and poorest in our midst, the prayer has gone up to heaven that God would bless our good Queen and help her in her great bereavement. The turbulence of ignorance has in a great measure given place to orderly peacefulness, and now we fear little from any outburst of popular violence, for our honest course has so well enlightened the public mind that however severe the depression of trade, they see as clearly as any one the utter uselessness of all forcing-processes.

Two years later he made an excellent speech, on a similar occasion. We quote a passage full of sound thought, and admirably expressed:—

The days are past when a man could say, "I have no interest in my neighbour's welfare;" for now the several classes of society are so thrown together, and their destiny is so interwoven, that whatever tends to the interest of one is for the benefit of all. If a man is ignorant, it is so much power subtracted from the common stock, and society, as a whole, has to bear the loss. His work loses in value for want of intelligent thought being brought to aid him, he passes through life fit for nothing but the commonest drudgery of mechanical toil, and in old age is oft thrown on his master's charity, or left to be a burden his life out on society at large. There is danger, too, in ignorance, in that it makes life less secure, and property less safe and valuable, and threatens, moreover, the very constitution of society, in that ignorance is a chronic evil too near akin to madness to be controlled or made useful; it moves by unthought-of impulses, and in methods that are unaccountable, and in a moment when least expected the frenzy of the popular passion may vent itself in a way that shall cause misery to thousands, and throw back our progress for years and years to come. For these reasons, then, it becomes at once the interest and the duty of all who can to help on the time when the working man shall rise to that mental equality with the other class of society which shall do away with the heart-burning and fancied antagonisms that now sunder class from class, and enable us, in our several walks of life, to understand one another better; when the neglected ones that are now a danger or a disgrace shall become useful members of society, and citizens worthy of that free England it is our privilege to live in.

Later speeches are similar in tone; and we can well understand, from their perusal, the influence which Mr. Crowther exercises over his fellow-members.

In addition to his hard work in the factory and his exertions in the Mechanics' Institution, Mr. Crowther is an active member of the United Methodist Free Church, a local preacher, and a Sunday-school teacher. He labours hard to make his fellows better than he found them. He is yet a young man; and we trust that he may be spared for many years to witness the fruition of the good seed he is so industriously sowing.

THE FACTORY ACTS ANTICIPATED IN BIRMINGHAM.

In the early part of the present year a meeting was held in Birmingham, at which several of the principal manufacturers of the town advocated the introduction of the Factory Acts, subsequently taking upon themselves the voluntary adoption of the principal clauses of the same. A set of the rules carried out in one of the factories has been forwarded to us. It is as follows:—

"RULES TO BE OBSERVED AT FRIDAY BRIDGE WORKS.

"1. No persons shall be allowed to enter this manufactory but those who are employed therein.

"2. No child will be allowed to work in this manufactory under nine years old.

"3. All workers are required to keep their time punctually, as follows:—Work hours commence at seven o'clock in the morning, and continue until nine o'clock. Forty minutes are then allowed for breakfast.

"At twenty minutes to ten o'clock work recommences, and continues until one o'clock. One hour is then allowed for dinner. At two o'clock work is resumed until six o'clock, when the manufactory is closed. No person will be allowed to work after six o'clock without special order.

"The gates will be closed precisely at fifteen minutes past seven, opened at nine o'clock, and closed at forty minutes past nine in the morning; at one o'clock they are re-opened, and closed again at fifteen minutes past two. No person will be admitted after the gates are closed.

"No cooking or making tea will be permitted except at the proper time allowed for breakfast and dinner. Every person found cooking, except at proper time, shall for each offence forfeit threepence to the funds of the sick society.

"4. No one employed is allowed to bring children, or to engage any individual without the approbation of the employers.

"5. No basket or bundle will be allowed to be brought into, or taken away from this manufactory.

"6. No person will be allowed to remain during dinner hour without permission.

"7. No person will be allowed to leave this manufactory during work hours without permission.

"8. No person will be allowed to enter any shop unless employed therein; if so offending to be fined threepence, to go to the sick fund."

It can be easily imagined how mutually advantageous the change must be from the adoption of the well-considered rules before us, when introduced as a system in any manufactory. Perhaps, of all the great manufacturing centres, whether we take Glasgow, Leeds, Manchester, or the cloth-workers of the West of England, there is not to be found the same amount of irregularity in any of the mills or manufactories as is observed in Birmingham. Here time is frittered away. Too often, in very many places, workpeople may commence work at any hour their inclination suits them. Seldom before eight o'clock, oftener nine, and sometimes ten; and at eleven o'clock work is discontinued for luncheon, and it too frequently happens that the late working hours of the previous night destroys the appetite for breakfast, so now a beefsteak or a rasher of bacon is cooked, and a good half hour is lost thereby. Here, however, the evil does not end. The same looseness is observable in the evening. The manufacturer must get his orders executed. The result is, the manufactory must be kept open for the late morning comers, and so far into the night do they peg at it, sometimes nine, but oftener ten and after; the additional privilege being extended to those who are devoted to the worship of Saint Monday, to work all night towards the latter end of the week to make up for time lost. And as most of the trades are very much subdivided, one branch being interdependent upon another, those of regular habits, or desirous to be, whether child or adult, are often involved and necessitated to work the same hours with them they would scorn otherwise to imitate. This little ray of light leads us to hope there are not far distant better days for working people.

Safety for Miners.

ANSELL'S FIRE-DAMP INDICATOR.

In 1844, the coal and iron-stone mines of Great Britain numbered 3,220, and the computed number of male persons employed was 307,542. It appears that of these one life in 354 was lost by accident during the year, and that for every 109,718 tons of coal recovered and brought to the surface one human life was sacrificed. Beside the fatal accidents, there is a fearful array of contusions, fractures, maimings, amputations, &c., so that the record of mining accidents reads more like the description of a battle-field than the ordinary report of industrious and peaceful pursuits.

This heavy mortality shows that the means at present employed to indicate the presence of fire-damp are inadequate. Much evil, however, results from the recklessness and ignorance of the workmen. The "Davy lamp" is constantly being tampered with; the "Geordie" is not held in much favour; and the "Dumas" lamp does not yield sufficient light to enable the miner to see his work. The Davy lamp serves, however, to indicate the presence of fire-damp. Mr. G. F. Ansell, of the Royal Mint, now offers to miners and mine-owners a simple and beautiful fire-damp indicator, by means of which the presence of the smallest per-centage of fire-damp or choke-damp is immediately detected. We give a description in his own words:—

"The apparatus is of three kinds. The first consists of a diffusiometer, an electric alarum, and a small galvanic battery, the whole being arranged under a small stand, of sufficient portability for the miner to carry with him into the heading where he is at work, and upon a sudden irruption of fire-damp the alarum is rung instantaneously.

Its action may be explained in the following manner:—The diffusiometer consists of a bent tube in the form of the letter U, having at one end a cup or chamber, the surface of which is enclosed by a piece of porous tile. This tube is partially filled with mercury. When the fire-damp surrounds it, diffusion of the gas takes place through the porous tile, compressing the volume of air within the cup, and thereby forcing the mercury downwards, which rises in a corresponding manner in the opposite side of the tube; this is made to form contact with one of the terminal poles of the battery, and the alarm is given. By proper adjustment it can be set to indicate within five seconds after the irruption of gas. The second form of instrument is for indicating gradual accumulation; it consists of an inflated india-rubber ball, which is fixed in a frame. Diffusion takes place through the surface of the ball, causing it to expand. This force is applied by a mechanical arrangement to complete the circuit of a battery, and by means of a telegraphic wire it will indicate at the mouth of the pit where the air of that particular part of the mine is explosive. These instruments could be placed in different parts of the mine, and by a simple system of telegraphy a perfect knowledge of the state of the air would be had by those above ground; and in the case of a gradual accumulation taking place in the night during the absence of the miners, the affected part of the mine would be indicated at the mouth of the pit. The third arrangement is for indicating the presence of fire-damp and measuring its quantity. It is an adaptation of the aneroid barometer, and is extremely portable, being little larger than an ordinary watch. The instrument is graduated to the ordinary barometrical scale, and can be used as a barometer. When not required as a fire-damp indicator a small valve is attached, which, being open, admits the atmosphere, and the instrument acts as a barometer; but, when closed, the admission of gas must be through a porous tile, which causes compression (as before explained), and the indication is given by the hand upon the dial. The indications are unvarying, 100 per cent. of fire-damp being indicated by 1·680 inches of the barometrical scale, and 10 per cent. by 0·130 inches. It will also determine the amount of carbonic acid or choke-damp, the hand moving in the opposite direction to that for fire-damp."

In order to render the description fully intelligible, we append a description of the construction of the aneroid barometer.

The aneroid barometer was invented in 1847, by M. Vidy, and is as unlike an ordinary barometer as can be imagined. It is constructed of metal, and has no mercury. Its construction is based on the elasticity of metals—an essentially different principle from that on which the ordinary barometer depends. The form adopted by the inventor was rather complicated, but a skilful mechanician (M. Bourdon), acting upon M. Vidy's idea, and availing himself of the property discovered by Linz, a Prussian, that tubes curved to an elliptical section are distorted under the influence of internal and external pressure, realised a more practical form for the aneroid barometer, which is now generally adoped.

Bourdon's aneroid is composed of a copper tube, wide and greatly depressed, so that its transverse section has the form of a very elongated ellipse, while the tube itself has the appearance of a thick ribbon of copper. This ribbon is bent so as to form an almost entire circle; it is fixed at its middle in a circular case. A vacuum is effected in the tube, its two extremities, *a* and *b*, being closed, and they are connected by small copper pins with the two extremities of a small lever, moving on its centre, to which is fixed a sector of a toothed wheel, *g h*, of large radius, which acts on the pinion *o*, carrying an index hand, *c d*, the movements of which, over a graduated circle, serve to indicate the atmospheric pressure. In proportion as this pressure increases, the tube flattens in corresponding quantity; its curvature increases, its two extremities approach nearer together, and the index turns in one direction. When the pressure diminishes, this series of effects is produced in the opposite direction, and the needle turns the contrary way to what it did before. This barometer has the advantage of being light, portable, and not easily damaged or rendered unserviceable. It is very sensitive and correct.

THE FACTORY ACTS AND THE EMPLOYMENT OF CHILDREN.

Alluding to the argument very frequently adduced by employers against legislative interference with their respective trades, that thereby production would be seriously diminished, Mr. Redgrave, one of Her Majesty's Inspectors of Factories, in his last official report, quotes from letters which he has received from masters, which go to prove that this argument is, to a great extent, fallacious. The manufacture of earthenware was, perhaps, the most important brought under the Act under discussion, and of its operation, Messrs. Cochrane and Co., of the Britannia Pottery, Glasgow, write as follows:—"We confess that we were a little fearful, at first, of the effect of the new Act; but, so far, we have got on wonderfully well, and are persuaded now that, notwithstanding a few sources of annoyance created by it, some of which are inseparable from any change whatever, the trade will, ultimately, be very largely benefited by it; as we fully anticipate that greater regularity in the men, and the greater age of the youths from whom, of course, our tradesmen are drawn, will likely give us a better class."

Mr. Maling, of the Ford Pottery, Newcastle-on-Tyne, has also written:—"I can only say that I am very glad the Factory Act has been introduced. I think it will much improve the respectability of the workmen. When children were allowed to work after 6 p.m., men inclined to drink would do so on Monday and Tuesday, and would work their children half the nights of Wednesday and Thursday to make up their wages. They would also employ children of any age they could get, and very frequently the children were much too young and overworked."

The manufacture of lucifer matches is one of those dangerous employments which it was highly necessary to regulate, and very satisfactory reports are given by the large makers on the operation of the law. Messrs. Bell and Black, of London, say:—"As far as our firm is concerned, the Act has not had a prejudicial effect, but the reverse; and we believe that our opinion of the working of the Act will be endorsed by all large manufacturers of matches."

Respecting the effect of legal restriction on the employment of paper-staining, Mr. Henderson, the sub-inspector at Blackburn, on the authority of Messrs. Potter and Co., of Over Darwen, writes:—"When their works were first placed under the restraint imposed upon such establishments by the Act in question, a fear was entertained that their trade would suffer to some extent, as it was not unnaturally supposed that a curtailment of the hours of labour would lead to a diminished production of a proportionate amount; and as the winter months embrace the busiest season in the year in the paper-staining trade, the operation of the Act at Messrs. Potter's works has been watched with great care during the past six months. The result has proved an agreeable disappointment. There has been no decrease in production, which has been fully maintained, and that without any additional hands having been employed. The manager at Messrs. Potter's is inclined to attribute much of the result to the fact that, as the Act provides for regular meal-times for the children and young persons, and limits the hours of labour, the hands employed work with more energy and assiduity while they are at work than they did formerly, when their hours were irregular and unrestricted. The principals express themselves generally as thoroughly satisfied with the operations of the Act, which need not interfere adversely with the interests of the trade, or of their establishment; and after the first week or two, when it was being introduced, they have been but little inconvenienced by it."

Messrs. Potter's experience is confirmed in a remarkable manner by that of another large paper-staining firm in Lancashire—Messrs. Heywood and Co., of Manchester. The latter say:—"The inconveniences we expected to arise from the introduction of the Factory Acts into our branch of manufacture, I am happy to say, have not arisen. We do not find the production at all interfered with; in short, we produce more in the same time, as the young folks are not so wearied out as formerly with long hours. We must thank you for the assistance and advice you have so kindly rendered us on previous occasions, and we may say that the introduction of the Act, hitherto, has not given us any annoyance or cause of regret."

Then, as to the employment of fustian cutting, a branch of trade which, when the Act was applied to it, was in a most depressed and wretched state, evidence of an extraordinary improvement is furnished by this report. One master writes:—"There is no doubt the Act has been a great benefit, and with factory hours the hands can cut as much as we require, or ever did require them to do; for a hand was never asked to cut more than nine lengths a day. I am quite certain that the Act has raised the character of the trade. I would not have old times again." Another master says:—"Neither employers nor employed, not a single party I knew of, would be without the Act on any account;" a third, "I am quite certain the Act has been an advantage, and has raised the trade in the social scale, as it were. I quite approve of the Act, and the hands generally seem to like it very well;" while a fourth, in alluding to the effect of legal restrictions on the trade in regard to wages, says, "Formerly so many children were employed that the large undertakers, rather than be without work, would take it at any price. When prices were low, to keep the young hands together, until trade revived, I lost £3 per week by taking orders at a low price. This 41-inch double velvet we should have got 12s. per 100 yards for during the American war, and now we obtain 24s. Some women get 12s. or 13s. per week, but on an average about 10s. Young persons of twelve or thirteen years of age can get, at the lowest, 8s., and at some work 10s. per week."

JOHN STUART MILL ON THE FUTURE OF THE LABOURING CLASSES.

Whatever advice, exhortation, or guidance is held out to the labouring classes, must henceforth be tendered to them as equals, and accepted by them with their eyes open. The prospect of the future depends on the degree in which they can be made rational beings.

There is no reason to believe that prospect other than hopeful. The progress, indeed, has hitherto been, and still is, slow; but there is a spontaneous education going on in the minds of the multitude, which may be greatly accelerated and improved by artificial aids. The instruction obtained from newspapers and political tracts may not be the most solid kind of instruction, but it is an immense improvement upon none at all. What it does for a people has been admirably exemplified during the cotton crisis, in the case of the Lancashire spinners and weavers, who have acted with the consistent good sense and forbearance so justly applauded, simply because, being readers of newspapers, they understood the causes of the calamity which had befallen them, and knew that it was in no way imputable either to their employers or to the Government. It is not certain that their conduct would have been as rational and exemplary if the distress had preceded the salutary measure of fiscal emancipation which gave existence to the penny press. The institutions for lectures and discussion, the collective deliberations on questions of common interest, the trades unions, the political agitation, all serve to awaken public spirit, to diffuse variety of ideas among the mass, and to excite thought and reflection in the more intelligent. Although the too early attainment of political franchises by the least educated class might retard, instead of promoting, their improvement, there can be little doubt that it has been greatly stimulated by the attempt to acquire them. In the meantime, the working classes are now part of the public; in all discussions on matters of general interest they, or a portion of them, are now partakers; all who use the press as an instrument may, if it so happens, have them for an audience; the avenues of instruction through which the middle classes acquire such ideas as they have are accessible to, at least, the operatives in the towns. With these resources, it cannot be doubted that they will increase in intelligence, even by their own unaided efforts; while there is reason to hope that great improvements, both in the quality and quantity of school education, will be effected by the exertions either of Government or of individuals, and that the progress of the mass of the people in mental cultivation, and in the virtues which are dependent on it, will take place more rapidly, and with fewer intermittences and aberrations, than if left to itself.—*From the People's Edition of "Principles of Political Economy."*

Steel Watch Chains.—The small steel chain which winds round the fusee of a watch is about eight inches in length, and contains upwards of 500 links, riveted together. It is not thicker than a horse-hair, and the separate links can but just be perceived with the naked eye. Modern invention has, as yet, discovered no substitute for this chain equal to it in slenderness, strength, and flexibility. These watch chains are all manufactured at Christchurch, in Hants. The links are punched out by girls from plates of steel, and very young girls pick up the links, and rivet one to the other. Watch-chain manufacture has been the staple of Christchurch for nearly a century, ever since, in fact, pocket watches began to be generally carried.

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

IN estimating the work done by a man or other animal, we must distinguish between the work actually done, and the useful work. In some cases, the difference is due to a wasteful employment of the force at our disposal, and an expenditure of work on useless movements of the body that might be avoided; but, in other cases, no care will suffice to prevent a large amount of work being expended wastefully—as it may be impossible to do the work at all without wasting much force on the necessary movements of the body. This seems to be especially the case with the horizontal transport of weights—a kind of work that cannot be effected without the waste arising from the transport of the labouring animal from place to place. If we divide into useful and wasted work the work done in the horizontal transport of weights, in the three examples already given, we shall find the following results :—

HORIZONTAL TRANSPORT OF WEIGHTS.

KIND OF LABOUR.	USEFUL WORK.	WASTED WORK.	TOTAL.
1. Pedestrian .	—	7,543 ft.-tons	7,543 ft.-tn.
2. Porters . .	2,238 ft.-tons	5,402 „	7,640 „
3. Pedlars . .	2,688 „	4,276 „	6,964 „

The amount of work wasted in this kind of labour is inherent in the labour itself, and is much greater than that wasted in labour directed to the lifting of weights, in which the body may be kept nearly stationary, and a minimum expenditure of labour take place on unnecessary movements.

In employing the labour of quadrupeds, such as oxen, horses, and asses, we are forced to lose much of their force in the useless transport of the animals themselves, as they are not adapted like men, monkeys, racoons, or turnspit dogs, to climbing labour, in which there is always a minimum of force wasted on the body itself.

If we analyse the table of p. 178 in the same manner as the examples of horizontal transport of weights, we find the following :—

LIFTING OF WEIGHTS.

KIND OF LABOUR.	USEFUL WORK.	WORK WASTED	TOTAL.
1. English Treadwheel . . .	417 ft.-tons	—	417 ft.tns
2. Norwegian Treadwheel .	390 „	—	390 „
3. Hodman . .	181 „	182 ft.-tons	363 „
4. Shovellers . .	125 „	88 „	213 „
5. Tipping Wheelbarrow. . .	139 „	151 „	290 „
6. Paviors . .	352 „	—	352 „
7. Piledrivers (a)	242 „	—	242 „
8. Piledrivers (b)	260 „	—	260 „
9. Box lift . .	404 „	—	404 „
10. Swing lift . .	280 „	—	280 „
Mean . .	279 ft.-tons	Mean . .	321·1 ft-tns

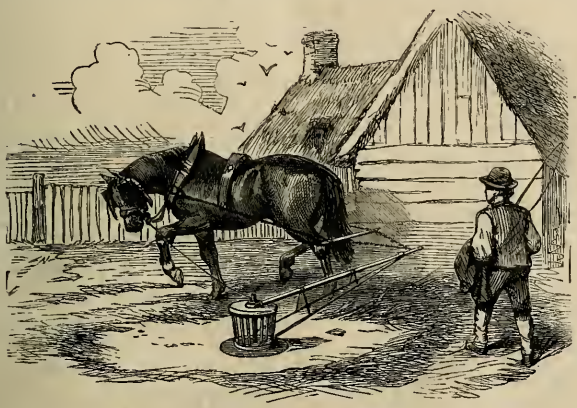
A horse yoked to a wagon will produce a larger daily amount of work done, than the same horse yoked to a whim, or similar contrivance; for he has greater freedom of action for his muscles, and labours under more natural conditions. All animals, also, including man, give out more work when labouring at a slow than at a rapid rate; and there exists for every different description of labour, a certain rate of performance, at which the maximum of work is done. The following table shows the work done by several animals in the horizontal transport of weights :—

HORIZONTAL TRANSPORT OF WEIGHTS.

	HOURS OF LABOUR.	WORK DONE.
1. Horse yoked to wagon (walking)	10 hours.	34·6 mile-tons
2. Horse yoked to carriage (trotting)	4½ „	23·9 „ „
3. Horse yoked to a whim (walking)	8 „	17·6 „ „
4. Horse yoked to a whim (trotting)	4½ „	14·8 „ „
5. Ox yoked to a whim	8 „	15·8 „ „
6. Mule yoked to a whim . . .	8 „	11·9 „ „
7. Ass yoked to a whim	8 „	4·9 „ „

The results of the foregoing table are calculated from the French observations, on the hypothesis already proved, that horizontal transport exceeds vertical lifting of weight, in the proportion of 25 to 1. The observations were made by measuring with a dynamometer the pull on the traces of the wagon in each instance, estimating the velocity with which the animal moved, and the length of its daily labour.

It seems to me that the works done by the horse drawing the wagon and carriage, are rather above the average, and should not be regarded as more than an effort made for a day or two; for no horse could continue, for a long succession of days, to draw a ton weight each day, for 34 miles along a well-made horizontal road; although such an effort might easily be made for a short period.



THE HORSE GIN, OR WHIM.

The accompanying illustration shows the general arrangement, and the inconveniences of the horse gin, or whim. It illustrates the pumping apparatus used to supply the Royal School of Portora with water from Lough Erne. The motions of the horse are necessarily cramped by the narrow circle in which he is compelled to move; and the work obtained per day, without distressing the horse, may be estimated as follows :—

The horse working for five hours, pumps 3,000 gallons of water to the cisterns, 120 feet above the level of the lake, each day. Hence, the work done in five hours, is

$$\frac{3{,}000 \times 10 \times 120}{2{,}240} \text{ ft.-tons.}$$

And this multiplied by the coefficient 25, and divided by 5,280, the number of feet in one mile, becomes

$$\frac{3{,}000 \times 10 \times 120 \times 25}{2{,}240 \times 5{,}280} = 7{\cdot}61 \text{ mile-tons.}$$

Or, in other words, the horse working for five hours at the pumps, does work equivalent to drawing a load of one ton a distance of 7·61 miles along a level, well-made road, whose coefficient of friction is 1-25th. As the whole day's labour is considered to be eight hours, at this description of work, we should add to the 7·61 miles 3-5ths of its amount, together with the work due to the friction of the pumps and pipes through which the water is forced. In this description of work, it is always considered right to assume 1-3rd of the work done to be consumed in friction. Hence, we obtain finally,

Work done in five hours . .	7·61 mile-tons.
Remaining three hours . . .	4·56 „
Friction of pumps	4·05 „
Total . .	16·22 mile-tons.

*Electrotyping.**

MOULDS.

EVERY substance which is a conductor of electricity may be employed to form a mould suitable for the electrotyping process, provided that it is not liable to be acted upon by the solution, or to be reacted upon by the metal precipitated. A non-conducting mould fulfilling these conditions may also be employed, by taking the precaution of imparting a conducting faculty to its surface by means of a very thin coating of a conducting body, like plumbago, in a state of powder.

Metallic Moulds.—The conducting bodies capable of serving as moulds are—the metals, well-calcined carbon, and plumbago. The solution most commonly employed in electrotype operations is sulphate of copper, upon which zinc, tin, and iron act. These three metals cannot, therefore, be employed to make moulds, unless previously coppered in alkaline baths. Platina and gold perfectly unite all the required conditions; but their high price does not admit of their being employed on a large scale. These exceptions stated, there remains among the abundant metals only silver, copper, and lead, and the alloys of the latter metal, to form moulds. Silver, which can be precipitated only by gold and platinum, must be employed to reduce the metals when we wish the deposit precipitated to be of great purity. We obtain very excellent moulds of copper by means of an electro-chemical deposit of this metal upon the original subject, or upon a cast suitably metallised. Sheet-lead, when carefully cleaned of its oxide, is first flattened in a press between two iron plates. The object to be moulded is placed on the lead and covered with a steel plate, and passed through a rolling-press; the lead receives a perfect impression of even the most delicate parts. This is the method adopted in "nature printing." The alloys of lead employed are plumber's solder type metal, and fusible metal. Moulds in fusible metal are employed only in copying medals. The alloy most frequently employed consists of five parts lead, three parts tin, and three parts bismuth. It melts at 176° Fahr. With this alloy moulds are taken by percussion. Moulds are taken in plumber's solder by pouring the metal on a piece of paper, and laying this on a piece of cloth. The medal to be copied is laid upon the alloy, covered with a piece of wood, and struck a sharp blow. The mould must not be separated from the metal until the latter is quite cold. Success in this kind of moulding depends on the skill of the operator.

Non-conducting Moulds.—The plastic materials most commonly used are plaster of Paris, wax, stearine, paraffine, gelatine, sealing-wax, and gutta-percha.

Wax.—Plaster models are put into warm water until they are thoroughly saturated, but not so as to appear wet on the surface; the plaster is then put into a paper bag, and melted wax poured upon it. Left in a cool place, the wax easily separates from the plaster; but as wax and similar substances contract materially upon cooling, it is necessary to employ a mixture of equal parts of yellow wax and resin. When melted and stirred together, the mixture is left to repose until all the bubbles have disappeared, and it has acquired the consistency of treacle. It is then poured over the model like wax.

Stearine.—Stearine may be employed in lieu of wax—or, still better, a mixture of thirty-two parts of spermaceti, seven of wax, and seven of mutton fat, melted and strained. It is well to add a little plumbago to the mixture, to impart conductibility. Plaster moulds should be saturated with stearine. Sulphur moulds yield very fine impressions.

Gutta-percha.—This substance is admirably

* Continued from page 258.

* Continued from page 277.

adapted for electrotype operations. Sufficiently elastic to admit of the copying of undercut objects, and wholly unchangeable in acid and alkaline baths, it lasts almost indefinitely, if it be kept from the air. To prevent the spontaneous change of gutta-percha, it must be kept under water. When old it becomes brittle; its original properties may be restored by boiling it with a third of its weight of new gutta-percha.

There are two methods of obtaining a mould—by melting and by pressure.

The first method consists in putting into a stove heated to 230° or 250° Fahr., the model and the sheet of gutta-percha, mixed with one-third its weight of linseed oil, so as to form a kind of fusion on the surface of the model; then, on removal from the stove, the gutta-percha is pressed down upon the model by the hand, moistened with cold water to prevent adherence, until a perfect mould may be supposed to be taken. When the gutta-percha is cold it is separated from the model, and presents a perfect copy of all the details of the original. The principal objection to this method is that the gutta-percha undergoes great change, in consequence of which it will serve for only a small number of operations, and require a long time for each.

The second process, much preferable to the first, is by mechanical pressure. It requires a large quantity of material, but is a better and quicker process than that described above. On the platform of a screw-press a frame is placed, in which the *bed* upon which the model to be copied is laid. A lump of gutta-percha, softened in boiling water, and well kneaded in the hands, then a counterpart representing the principal sinuosities of the model, and horizontal on its upper surface, are laid upon the bed. In order to avoid the adherence of the model, it is gone over with a soft brush dipped in weak soap-water, and the lump of gutta-percha is dusted with plumbago. The gutta-percha, in yielding under the pressure, drives out the air and water before it, and impresses itself perfectly on the model. When cold, the mould is removed. Moulding in gutta-percha requires models in metal, which may be pressed or heated, without fear of injury. If the model be of plaster or wax, we have recourse to modelling in—

Gelatine.—This substance is more elastic than gutta-percha, and admits of objects more undercut being executed. It has the inconvenience of spoiling in acid baths, and of furnishing a very brittle metal, in consequence of the necessity that exists for making a very rapid deposit to avoid alteration in the surface of the mould. Gelatine becomes nearly impermeable if we add to its solution in warm water 2 per 100 of tannic acid dissolved in alcohol, and 10 per 100 of treacle. But it still spoils in the baths if care be not taken to protect the external surface by a thin coating of gutta-percha or by a thick varnish. Dipping the gelatine mould into a strong solution of alum renders it of a horny texture, and less subject to be acted upon by the bath, but the mould contracts a little in consequence of this treatment.

Sealing-Wax.—Only the best quality of this material can be employed as moulds. It is usually applied to copy seals, by holding a card over the flame of a candle and rubbing the surface in a circular direction with a stick of sealing-wax until sufficient thickness is obtained. Care must be taken that no air-bubbles exist. The seal or other object to be copied is then applied with strong pressure, and left till cold.

METALLISATION OF THE MOULDS.

Non-conductors of electricity require to be metallised in order to render them conductors. This is accomplished by two methods—the dry way and the wet way.

Plumbago.—Of all metallic or metallising powders applied by the dry way, plumbago is the best. Its unctuous nature renders its application easy: by means of a soft brush the plumbago may be applied to the most undercut portions of the mould. All kinds of plumbago are not equally good for metallisation, and it is useful to make trial of their conductibility before adopting them.

The moist way consists in coating the surface of the mould with a metallic solution, and in reducing the metal it contains by the action of a gas, of a liquid, or of light. The most convenient solution is that of nitrate of silver in alcohol; it is applied to the mould with a fine pencil, and left to dry. Two or three successive applications are necessary; then the article is submitted to the action of nascent sulphuretted hydrogen gas. Immediately the surface of the mould turns black the mould is ready for the bath, for the sulphuretted silver has rendered the surface conducting. We may arrive at the same result by replacing the action of sulphuretted hydrogen by that of phosphorus dissolved in sulphide of carbon, or by the direct action of solar light, or by gallic and pyrogallic acids, or by sulphate of iron in its minimum state of oxidation; but the first method is preferable. It is employed to metallise vegetable and animal matters, such as flowers, fruit, insects, and osier and reed articles, so as to produce very curious results. The reduction of nitrate of silver by hydrogen permits, also, of the metallising of silk threads, and, consequently, of coppering, gilding, and silvering them. So, also, by metallisation by the moist way, glass may be covered with metallic deposits, producing very remarkable artistic effects.

When the moulds are rendered conductors, a copper wire is attached to them, and they are put into the bath.

If the article be undercut, it is well to multiply the points of contact, so as to cause the deposit to fall upon several parts at once. The physical qualities of the copper obtained depend upon a perfect equilibrium between the four conditions which we shall describe hereafter.

The thickness of the copper deposited upon a given surface cannot be perfectly uniform, in consequence of the galvanic current acting in an inverse ratio to the distance. The result is that the parts of the mould nearest to the anode receive most deposit, while the distant portions receive much less. There exists, therefore, very sensible differences in the thickness of the deposits, and, consequently, the electrotype deposit does not present all the solidity desirable.

To remedy this inconvenience, it has been proposed to solidify the interior of the galvanic shell, and take advantage of the different fusion points of copper and brass.

By means of the gas blow-pipe, wire or pieces of brass are melted into the copper shell, and perfectly unite with it, giving to the electro deposit the malleability and other qualities of an article that has been cast.

Metallic Powders.—Copper and silver are sometimes employed as metallic powders.

To obtain an extremely fine copper powder, the copper is precipitated from a boiling solution of its sulphate by metallic zinc; the copper is afterwards separated from the zinc in excess by diluted sulphuric acid; the powder obtained is dried at a gentle heat.

Silver powder is prepared by boiling recently prepared chloride of silver in water acidulated with sulphuric acid, and a piece of pure zinc.

The metallic powders are applied to the moulds—plaster impregnated with unctuous matters, &c.—after slightly warming them. A camel's or badger's-hair pencil is preferred for this purpose. The parts of the mould on which the metal is not to be deposited are coated with varnish.

Metals can be applied to glass without the interposition of a varnish. The object is submitted to the fumes of hydrofluoric acid, until the surface assumes a *mat* or ground-glass appearance. Plumbago is then applied with a cork or leather stump; an exceedingly thin coating of plumbago adheres to the rough surface with great force.

Cleaning.—The plastic moulds, when covered with a conducting coating by the preceding processes, are ready to be immersed in the baths. The metallic surfaces require to be first scoured and cleaned, either by chemical or mechanical means, which will be described hereafter.

SOLDERS.

To establish communication between the mould and the negative pole of the galvanic battery, a conductor is formed of a band of copper or of lead, which, if the mould is metallic, is soldered to the edges in the following manner:—

Soldering with Chloride of Zinc and Tin.—The two surfaces to be united are scraped clean and slightly moistened with a pencil dipped in hydrochlorate of zinc, and then are easily soldered with the soldering iron and a little tin solder. After putting them closely in contact, the soldering is completed with the iron, or the spirit-lamp.

Soldering with Stearine.—This process is simpler than the other. Stearine, generally at hand, is the only substance required to deoxidise the metals, and determine their adherence by the aid of tin solder.

The pieces to be cleaned are first scraped, and rubbed with sand-paper. The articles are then warmed at the flame of a spirit-lamp, and rubbed lightly with a piece of stearine. A very thin piece of solder is then applied to the heated part, which immediately spreads and combines intimately with the copper. The same operation is repeated upon the other piece to be soldered. The two articles are now held in close contact by a pair of pincers, and heated together, and they are left in the pincers until they are cold.

The Rev. F. D. Maurice's "Workman and the Franchise."

Always a thoughtful and distinguished writer, remarkable yet more for his ideas than his diction, the Rev. Frederick Denison Maurice has created another claim to public gratitude by publishing his admirable little volume entitled "The Workman and the Franchise." "Admirable" we have called it; yet, perhaps, "excellent" would be a more appropriate term, as having reference to its quality rather than its execution. Through dislike to add another theory to those already guiding or encumbering the world, the author does not define what kind of franchise he would have. Yet, he does appear to do that, for he evidently thinks that manliness and wisdom are the true qualifications for the franchise; but he does not commit himself to any method by which the legislator may lay his hands upon those who possess these qualities. Mr. Maurice, however, does great service by indicating what the legislator ought to look for, and by maintaining that in manhood, rather than in money, the true civic virtues are to be found.

The old Society of Painters in Water Colours, who have recently opened their Sixty-second Exhibition in Pall Mall, number among their painters Mr. Evans, of Eton, who has painted "Eton Common" and "Windsor from Eton Wick," in which the castle is seen in the distance. In each picture the painter has caught the spirit of Eton scenery—richness, life, verdancy, beauty, and a pervading mist, which softens and partly obscures the distinctness of objects, and which suggests a certain fecundity of nature which produces it. There is an Eton spirit about Mr. Maurice's writing. The ideas seem to melt away. There is a certain mellowing haze about them. There is a wealth of beauty in them—you quite feel that. Angel forms are there, but you cannot interrogate them, to learn their mind; though you cannot fail to be allured to follow them and be enchanted by their grace.

A people's edition of "The Workman and the Franchise" is published, at one shilling and sixpence, for the benefit of the best of all London institutions—the Working Men's College—on whose behalf the lectures which constitute the volume were delivered. Mr. Maurice treats of the "Representation and Education of the People," and presents an historical survey of the rise of the House of Commons of England, and the gradual development of freedom in Europe. Nothing can be more timely, valuable, or instructive than such a book; and, perhaps, no living author is better competent to write it than Mr. Maurice. In his "History of Philosophy" he delineated the mind of philosophers, as well as their systems; and in this book he discusses the conscience which underlies all politics which have life in them. When Mr. Stuart Mill was a candidate for Westminster, Mr. Maurice went to a meeting of electors, and said, "I do not agree with Mr. Mill. Perhaps on a hundred questions I should differ from him on ninety-nine. But what we want most in Parliament is a just man. I believe Mr. Mill to be a just man, and therefore, despite all difference of opinion, I come forward to support him, and to vote for him." This is the grace of Mr. Maurice's character, and the secret of his great influence for good over all who have the good fortune to come in contact with him in his classes, in his congregation, or through his books. He does not frown upon or repel any who seek his counsel. He who means well, it matters not what he means nor how he means it—if there be the spirit of honest worth in the man—Mr. Maurice appears to respect him. In every page of this volume this fine feeling wins the confidence of the reader, even when he dissents the most.

There is a wise sentiment, applicable to our present Parliament, which occurs early in this

volume: "If Caius Martius wished to assert Rome as a city of freemen, he should have welcomed the cry for freedom in all who dwelt under its shadow. That would have been the true security for the reverence of the old families." Our present word "people," Mr. Maurice points out, does not mean what the Roman meant by it. With us it means "all those who dwell in cottages," as Mr. Bright once defined the word. With the Roman, people meant patrician. Where Shakespeare uses the word "people," Macaulay uses the word "commons." Mr. Maurice points out that, with the Roman, "the patrician was the *Free Man*." The Roman spirit had this nobleness in it. If a man had not "a hide of land, still it behoved a Roman to be a free man. At all hazards, at all sacrifices, he must maintain his freedom." Despite, however, sentences so clear and thoughts so valuable as those just quoted, and which abound in every page of Mr. Maurice's book, we cannot be sure of his definition of "commons," of which the House of Commons is the sign. It must mean the knights of the shire, burgesses of the towns, freeholders and freemen. Yet the reader is not quite certain of this. Take these sentences: "The Norman barons or lords spoke the tongue which they had brought with them. The English tongue was the tongue of the Commons."

Now, who are the commons—who are the people above them, who are the people below them? When Mr. Alfred W. Hunt paints "Climbing Shadows," as may now be seen in the Water Colour Exhibition to which we have referred, or Mr. E. Warren paints the scene where the "cuckoo" sings, lately exhibited by him, you share the sentiment of the shadows, you imagine the very spot where the concealed songster is cooing. There is feeling and suggestiveness in the painters, but in books you want a backbone of definition. You want to know, and to know that you know. Mr. Maurice takes so wide a range of view that he seems to have no measure small enough for the ignorance of common men. If some fairy would lend him a rule of this description, he would be one of the happiest, as he is one of the noblest of the teachers of the "people," whatever the word may mean.

Mr. Maurice's book is, in fact, a history of the rise and growth of the House of Commons. We celebrate centenaries now, and rejoice on great days. In January this year was the six hundredth birthday of the House of Commons. Mr. Maurice seems to think that our politicians might wisely have celebrated that day, and we think so too. In 1265, the king of that time being in durance, the writs for summoning the first House of Commons "were really drawn by the Earl of Leicester." Few passages more interesting we have seldom met with, than those in which Mr. Maurice gives an account of the author of our Parliament. Leicester was a foreigner; he came of a bad family, had a bad character, and appears to have deserved it. "Yet he became dear to the Commons. He was celebrated in English speech and song as their deliverer. He was the man—to borrow the title of one of Miss Martineau's books—who fitted the hour. The moment was come when a work was to be accomplished which had long been preparing. A House of Commons had become a necessity. He perceived the necessity, and was the instrument of bringing it into existence."

In those days the Franciscans arose. "Grostête, afterwards Bishop of Lincoln, was completely carried away by the reports which he had heard of the Franciscan preaching. He longed to be admitted into so holy and noble an order. The denunciations of ecclesiastical wealth, the honour put upon the poorest people, the implicit protest against baronial tyranny, were most acceptable to him." We get here a glimpse of what there was renovating and sacred in Franciscanism in its first inception, and of the fine character of Grostête, who appreciated the order. Now this Grostête was intimate with Leicester. They were much attached friends. It exalts Leicester that he should possess and cherish the friendship of a man like Grostête. "To the blessed Robert of Lincoln," says the chronicler who continued Matthew Paris, "did the Earl of Leicester steadfastly adhere." Under his counsel he attempted arduous enterprises, ventured on uncertain paths, and brought imperfect schemes to completion. For the remission of sins, so it is said, the bishop bade him enter upon the cause for which he contended unto death. Some tell us that the bishop once laid hands on the first-born son of the Earl, saying to him, "My dear child, thou and thy father will die in one day, by the same kind of death, struggling, however, for righteousness and truth."

"From such testimony," we may gather, says Mr. Maurice, "how very sacred the cause in which Leicester was engaged appeared to the most earnest men of his age. The words in which the chronicler I have quoted sums up his lamentations for Leicester, after his fall at Evesham, expressed, no doubt, the feeling of those who had the best education of the time. 'Thus,' he says, 'did this magnificent man conclude his labours—a man who gave not only all he had, but his own self, to relieve the oppression of the poor, and to defend justice and the right of the kingdom. For his knowledge of letters he was worthy of all honour; in the divine offices he was assiduous; he was frugal, faithful to his word, severe in countenance, constant in his prayers, reverent to his teachers, giving his nights to watching more than to sleep.'"

Such are the characteristics of the opening only of Mr. Maurice's book, "The Workman and the Franchise," of which we may say more, but have already said enough to induce our readers to look into its pages.

David Wingate, the Collier-Poet.

That poetry is popular with the working man is a grand fact. To prove this, we have only to refer to those beautiful old English ballads—historical and legendary—which have been handed down from generation to generation as priceless heirlooms of the great family of toilers. And a lover of poetry the working man will always remain, as surely and so long as his love of honest work continues. A life of honourable labour is in itself a poem; barren indeed, it may be, of the epic, but fraught with the humbler yet no less heart-stirring incident of the idyll.

True, the working man cannot, as a rule, taste the delights of classic poetry, or appreciate the artificial finish and sentiment of drawing-room verse; but who can deny that the poetry of Nature—the life without and the life within—strikes a deep and fibrous root in the warm and fruitful soil of his strong spirit?

The working man loves that poetry which, like himself, is genuine and manly. He cannot love that which merely tickles the ear, but he will joy in and treasure up that which touches his heart, and unlocks the vent of his sturdy emotions. Happy the one or two minstrels who possess this master-key, and use this great power to a noble end. These, moreover, chiefly belong to the class themselves, and have found amidst the clods of daily toil and struggle up the rugged pathway of their lives, the sweetest and fairest of perennial flowers, which they have gathered to cheer and encourage the hearts of their brother toilers, and which, when they have reached their journey's end, they will leave behind them, as a rare yet common legacy to the bees of a later day. One of this goodly brotherhood, whose name and title heads this paper, has presented to us a second garland of such blossoms, fresh with the dews and ripe with the fragrance of living nature.

We feel sure that every reader of this paper will join with us in saying, "Welcome again, David Wingate!" and in thanking him for his sweet and touching idyll of "Annie Weir," who, in the eyes of her lover, Reuben, a collier,

"Was fairer far
Than the gowan or the star,
In the green glades o' earth or the blue o' heaven,
And gentler than the dove."

Surely this description is of some sunny-eyed, bright-browed, rosy-cheeked, ruddy-lipped rustic maiden, and not of a coal-begrimed, coal-burdened, collier-girl, the essentially masculine nature of whose work compels her even to forego much of the dress which woman wears for the closer and less elegant garb of a man! Reuben tells us that Annie and he worked in the same mine, and also that—

"She was nae seventeen,
But at work she lang had been,
And up the weary stairs wi' her coal-creel laden,
Day by day, wi' trembling limb,
In the twilight dim,
For her frail old father's sake, clamb the peerless maiden.

"That her silken auburn hair,
Snowy hauns and face so fair,
Should be daily soiled sae sair I aye was mourning;
But my Annie at her wark,
Aye as lichtsome as a lark,
Gaed singing to the stair, and sang returning."

The incident of the story is as follows:—An irruption of water takes place one day in the mine. Annie Weir is on the stair, and out of danger; but seeing that Reuben is not amongst the rest who are making their escape, with an heroic self-forgetfulness she flies to seek and acquaint him of the peril. They run together towards the stair, but are met by the "black and stoury flood," and, seeking in vain for an outlet, return to the former place of danger.

"We didna tear our hair,
But it surely was despair
That made us ither's hauns sae wildly tak';
For our heavy hearts aye sunk
As wi' hollow, dismal clunk,
The water slowly rose and drove us back."

Thus for three long days the lovers wait in hunger and darkness, and at length, just as the soul of Annie seems passing away beyond the earth and beyond the skies, they are rescued by the searchers, who have been all this time hard at work digging through into the dark prison. Annie revives, and she and Reuben are wed; but Annie's spirit, having once pruned her wings for flight on the threshold, does not long stay here, and at the end of a year her body is laid beneath the churchyard turf; "and, oh!" Reuben concludes, "that we were ance again thegither!"

Such a story is entirely fresh and new, and will, we should think, be long remembered and re-read by the people, who will surely feel grateful to the collier-poet for investing with poetic interest and beauty the rough and gloomy scenes of a miner's life. Throughout this and other poems which we have not space specially to notice, it is not difficult to trace the hand and heart of a genius, albeit one of a humble calibre, who sings true heart-songs, and gives fair promise of still sweeter strains.

THE LONDON FEMALE SCHOOL OF ART.

This school, originally the "Female School of Design," was established by Government at Somerset House in the year 1842-3, but from want of accommodation was removed to adjacent premises in the Strand, and, for a similar reason, was afterwards transferred to Gower Street in February, 1852. On the reduction of Government aid, in 1859, it was again removed to 43, Queen Square, and placed under the charge of a committee of management, with the view of establishing it on a self-supporting basis.

The object of the institution is twofold:—1st. Partly to enable young women of the working and middle class to obtain an honourable and profitable employment. 2nd. Partly to improve ornamental design in manufactures by cultivating the taste of the designer. Most of those who come to the school live at too great a distance from South Kensington to be able to attend there, while there is no other school in London, exclusively for females, in which teaching is given for the whole day, on five days of the week, or in which the instruction is so ample, and the range of subjects so extensive.

The general course of instruction comprises—geometrical drawing and perspective; elementary free-hand drawing from the flat and from the round; shading from the flat and from the round; drawing from solid models; figure-drawing from the flat, from the round, and from the life, including anatomical studies, and drapery; wood-engraving; painting in water-colours, tempera, fresco, and oil, from examples of ornamental art, from nature, landscapes, animals, foliage, flowers, fruit, &c.; exercises in composition, and original designs for decoration and manufactures. The teachers of the school hold full certificates from the Science and Art Department.

In a recent report the committee state that they have purchased the freehold premises situate at 43, Queen Square, and erected a noble gallery, which may compare with any studio in London for space, light, and ventilation. They have also thoroughly remodelled the entire house, and, by raising the roof, they have converted the upper storey into a spacious and useful elementary class-room. The establishment is now capable of accommodating from 150 to 200 students. To encourage the objects of the school, Her Majesty the Queen has signified her intention to contribute £10 annually towards the foundation of a scholarship of £20 per annum for the students of this school, to be called "The Queen's Scholarship," and the committee are most anxious to raise a permanent fund in order to carry out the gracious intention of Her Majesty. Applications for admission, prospectuses, or any other information, should be made at 43, Queen Square, Bloomsbury.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

We have much pleasure in announcing that the following gentlemen have kindly undertaken the adjudication of the Prizes:—The Right Hon. Lord Houghton; Right Hon. Lord Lyttelton; Right Hon. Lord Talbot de Malahide; Lord Milton, M.P.; Charles Buxton, Esq., M.P.; John Stuart Mill, Esq., M.P.; Rev. Charles Kingsley, M.A.; Rev. F. D. Maurice, M.A.; and the Rev. J. Begg, D.D.

The Victory in Parliament.

The great Reform Division which recently took place in St. Stephen's must be regarded as a victory of the working classes. It is they who have been on trial during the protracted debates which we have chronicled in these columns. The Franchise Bill was objected to because it proposed, for the first time in English history, to make the working class a political power in the State. They have always been the industrial power—they have long been a social power; and the end must be that they will become a political power. Everybody sees this. Many are glad of it—others fear it. Already Lord Cranbourne talks of the people as the future sovereign, and it is but natural that there should be inquiry into the character of the new king. We believe His Majesty will prove quite as wholesome and sensible a king as any one we have seen of late years in Europe. There are many reasons for this belief on our part, some of them extremely cogent. The new *régime* is not one to be feared. Its powers will not be suddenly acquired, but by degrees, involving the preparation necessary.

Some thirty years ago the middle class attained their kingship in this country, with great advantage to the progress, security, and satisfaction of the State. Liberty has increased, government has improved, the institutions of the country are more respected, and even the Crown commands more of the popular affection than it ever enjoyed before. Every one of these advantages will, we believe, be extended by the accession to power of the new monarchy of the people. Reasons numerous and sound can be given in support of this opinion.

There has been great criticism of the character of the working class of late: so there was of the middle class formerly; and this difference has been clearly established now that the character of the working class in 1866 stands higher than that of the middle class in 1832. The people are better known now than the middle class were then. They are better informed also. The Press, which spoke with a hundred tongues weekly, and not very intelligibly at that time, now speaks with a thousand tongues daily, with ten thousand tongues weekly, and with a degree of plainness, fulness, and explicitness unknown, unimagined, and indeed impossible in the old pre-Reform Bill days. It cannot be said that the press may speak and no one hear. It would not and could not continue to speak unless the public did hear. It cannot be said that the public may hear and not regard. They have regarded. The cotton famine tested that. The vast, unknown quantity, which so terrifies the speculative politician, passed through a fearful and protracted temptation, and came out upright. None hesitated, and none fell. The great bulk of the people, therefore, may be trusted. The middle class of 1832 had never given such proof of fitness as this. The great interests of industry, therefore, are entitled to political representation.

The ninth Report of the Trustees of the National Portrait Gallery has, by command of the Queen, just been presented to Parliament. The Report itself is addressed to the Lords of Her Majesty's Treasury. It states—"In this year, as in the preceding, the trustees gave directions to open the apartments during the first three days of Easter week, and have again, as on former occasions, been highly gratified at the results."

Of Easter Monday the secretary states in his report:—"Notwithstanding the increased number of visitors, everything was remarkably quiet; people spoke in a low tone, and were extremely well-behaved." And of Easter Tuesday:—"I observed to-day rather more working men in their rough clothes than yesterday. Not one attempt has been made to touch the pictures or handle the written tablets. The care which they all take of the printed lists as they go down stairs, by folding or rolling them up and putting them in their pockets or bags, shows that they value them. People were all remarkably quiet." This is independent, timely, and relevant testimony of weight.

Lord Cranbourne, in the late debate, affected to modify the accusations made against the people. He was disposed to admit that their nature was as good as that of any other class, but that, being poorer, they were more exposed to temptation. It has been well answered by the *Daily News*, that all poverty is relative. A man is poor when his income falls below his expenses; and in this sense middle-class men or lords may be, and often are, poorer than the generality of working men. But there is a yet more conclusive answer: The people may be pure as a class, however tempted. Of this Lancashire may be cited in proof. The whole population were poor; their income was entirely cut off; they were subject to serious and protracted privation; strong temptation was at hand; they needed only to clamour to the Government to take a certain political step, and relief would arrive. They were besought in every way to do so, and they steadfastly declined. There is an end, therefore, of all charges against the unfitness of the populace to exercise political power.

Mr. Disraeli laboured in his speech, and was for a long period ineffective; he seemed to lose at times the thread of his argument, until he took up his wonted weapon of invective, when he became fitfully brilliant. The purpose of this great effort was to summarise the direful consequences of admitting the working classes to representation in that House. Eloquence, scholarship, genius, and everything else with a dash of mortality in it, is to expire then. We are not quite so sure of this. Mr. Mill, Professor Fawcett, Mr. Hughes, may be taken as examples of the men the working classes would send, and, indeed, have sent, not to mention Mr. Layard, Mr. Stansfeld, and others. On the other hand, Mr. Gladstone, as boldly as generously, avowed that he thought that it was desirable to have working-class representatives in that House. We do not pause to say what changes this implies in Parliamentary arrangements. Elections must be simplified and rendered less costly. How purely working-class members are to be enabled to attend on Parliamentary duties, expensive as those duties now are, are questions upon which we do not enter. We are only concerned to notice now that the House of Commons has arrived at the conviction—which Mr. Gladstone so eloquently expressed—that working-class members are destined ere long to appear there. The vast industrial interests of the people entitle them to this power of self-defence. Pauperism must cease among their class; their honour will demand it when the class enters Parliament. They can clear their way and pay their way, as the middle class have done. The Chancellor of the Exchequer evidently feels this truth. His great speech was brilliant evidence of it. His earnestness was never betrayed in more thrilling tones; his language was swift, impassioned, glittering; his sentences had a simple, compressed energy, unusual with him; and when he raised his hand over his head, as he spoke of the banner that the people would bear, perhaps not to an easy, but to certain and not distant victory, it vibrated with emotion. His manner was so changed and inspired, that any one who had seen at that moment only would scarcely have known him. When it is considered that the House of Commons contained, within two, the greatest number of members who ever divided on a public question, and that the majority decided in favour of a Franchise Bill—the first that ever proposed to admit the working classes to political power by the direct action of their own representatives—the memorable division was in every sense a victory of the people. The Government who have thus made themselves the defenders of the working class will not resign, nor dissolve, nor fail.

Shall Victoria Park be Destroyed?

Has it come to this—that, after all the agitation about sanitary improvement and progress, we are to have several huge gasometers set up in Victoria Park, or so near to it as to impregnate it with vile sulphurous fumes? People used to be afraid of gas—they feared its explosiveness. The subtle, hidden enemy was everywhere, and no one knew when it would make its power felt. Science and mechanical skill have allayed these alarms, and we dwell in security with gas-meters in our cupboards,

CO-OPERATIVE MANUFACTURING ASSOCIATIONS.

To carry on such undertakings successfully, requires not only great skill and judgment on the part of the managers, but great forbearance and a strong spirit of subordination on the part of the capitalist workmen, who have to submit themselves to the control of those who are their own paid servants. That they have often been found deficient in the latter qualification is unfortunately but too plainly manifested by the lamentable shipwreck of some of these establishments on this rock. For instance, a mill at Padiham was forcibly entered by some of the operatives, who tore the cloth from the looms and damaged the machinery, because they could not have the overseers they chose; the concern was thriving at the time, and could have easily borne the loss, but as some of its funds were borrowed, the creditors, fearing its safety, came down for their claims, and made it bankrupt. However, it is not unnatural to expect that these qualities of subordination and forbearance will be duly developed in time, as appears to have been the case already in Rochdale.

On the question of whether the requisite skill and judgment can be found in the managers, who are themselves frequently men from the ranks of the operatives, it is allowable to speak with more confidence. It appears that the capitalists who are owners of the large mills perform little or no part of the duties of supervision or management in person, but depute all to their hired subordinates. Mr. Cooper, one of the managers of the Rochdale Pioneers Society, in a letter to the author on this subject written some years ago, observed: "Persons acquainted with the manufactures of this district know that, as a rule, the employer does little more than give a general oversight to his business; the rest is done by the workers, including those who buy the raw material and sell the manufactured article, the managers, overlookers, &c.: and if these can manage a concern for a capitalist, can they not do it for the workers, who by their united subscriptions become the capitalists also?"

Supposing this condition to be fulfilled, and that a Co-operative manufactory is fairly started, it possesses one great advantage over similar industrial undertakings conducted by private capitalists, namely, the greater energy which, owing to the interest which each co-operative takes in the amount and excellence both of his own and his neighbour's work, will necessarily accompany the exertions of all engaged in it. Those who are accustomed to an agreeable variety in their occupations cannot perhaps realise the exhausting monotony of the great majority of mechanical employments: the interminable rows of bricks, the everlasting piles of mortar; the endless length of twist, and the boundless expanse of cloth spun and woven to the incessant din of clanking and crashing machinery, are scarce less disheartening than the eternal "seam and gusset and band, band and gusset and seam," which forms the "be-all and the end-all" of the poor seamstress's dreary existence. Is it, then, strange that the workman should at times become gloomy and discontented? that he should seek to dissipate the shadow which darkens his life by artificial stimulants, and vent his dissatisfaction in complaints against society and against his employer? But when you reflect that in addition to this, he is remunerated not in proportion to his diligence, but according to a fixed standard, can you conceive anything wanting to deprive him of all interest in his occupation, and render the primeval curse of labour a curse indeed? Even his very strength but aggravates his discontent, doomed, as he feels himself to be, to grind in the prison-house for the benefit of those he abhors. Now, here the principle of Co-operation steps in, and sheds a gleam of light over the dark pathway of his life: establishing a close connection between the remuneration and the toil, it robs the latter of half, nay, all its bitterness; for profit sweetens labour. Henceforth the trowel and the saw, the loom and the crank make merry music: they tell of comforts augmented, of competence realised, of independence gained. The mechanic goes to his work cheerfully, labours at it with zest, and leaves it with regret. Mere existence, which to every man in full health ought to be a joy, becomes so to him once more; he begins to feel some pleasure in the present, because he has some hope in the future. This, however, is to anticipate slightly another branch of my subject, namely, the benefit which these societies confer on the working classes.

There is one great difficulty with which Co-operative manufactories have to contend in common with all other mercantile undertakings, and which it was at one time thought would prove an insuperable obstacle to their permanent success, namely, that of commercial revulsions and the other accidental disturbances to which trade is liable. The extent of this difficulty is very clearly explained by Mr. Edmund Potter, President of the Manchester Chamber of Commerce, in a paper on Co-operation and its tendencies, read before the British Association some years since. Co-operation, he says, "would prove weakest during periods of depression, and could not find power of sustentation from a multitude of shareholders of the weaker capitalist class; whilst," as he adds, "it would not supply the power of purchase and expansion during these periods when the private capitalist invests and expands most profitably."

These views are pretty generally entertained among theoretical men, as well as those who, like Mr. Edmund Potter, are intimately acquainted with the phenomena of trade, and the conditions essential to success in commercial undertakings. But let us see what has actually happened during the great commercial revulsions which have occurred since co-operative societies began to be established. Has any large number of them failed? or rather, has any larger number of them failed than has occurred in the case of establishments in the same branches of business conducted by private capitalists? If any crisis was likely to try the strength of co-operative associations, the cotton famine was that crisis. Yet what is the fact? co-operative societies have come out of that terrible ordeal almost unscathed. Like other establishments, they have felt the pressure keenly; but from inquiries that I have made it would appear that such failures as have occurred, though doubtless hastened and aggravated by so terrible a pressure, are in no case attributable entirely to this cause. If, then, co-operative manufactories have survived this exceptionable, this unparalleled trial, may we not safely conclude that, if properly conducted, they will come safely through whatever others the future may have in store for them?—*From a Lecture by Professor Houston, Trinity College, Dublin.*

---

*A Ramble among the Working Men's Clubs and Institutes.**

BY THE REV. H. SOLLY.

Being too much occupied just now to continue an examination of the causes that have led to the failure of several Clubs and Institutes, I give the following extracts from a report which will, I think, be interesting to the readers of the Working Man. A gentleman of great experience and intelligence, taking a tour in September last for the benefit of his health, kindly undertook to visit certain Working Men's Clubs, and furnished us with a report of his visits, from which the following passages are taken:—

"My first visit was to F——, an agricultural town with 3,000 inhabitants. The Club there is tenant of an old, inconvenient, and musty six-roomed house, for which it pays a rent of £12 a year, the taxes amounting to about £2 more. Three of the six rooms of the Club-house are used, respectively, as a reading-room, a conversation and smoking-room, and a games-room, and the other three are appropriated to the manager of the Club. The manager is a married man with a family. He receives no salary, but, in return for the performance of his duties as manager, lives rent free, and is supplied by the Club with coal and gas. He makes in addition some little profit, though only very little, by the refreshments which his wife is occasionally required to supply to the members of the Club. The number of members at the time of my visit, exclusive of honorary members, was 64, of whom 36 were quarterly members, paying 1s. per quarter, the other 28 being weekly members, paying 1d. per week. In addition to these 64 ordinary members, there were about 30 honorary members, two of whom had subscribed two guineas a year each, nine one guinea a year each, and the remainder from 5s. to half-a-guinea a year each. Last winter the number of ordinary members averaged 130, or twice the number there were at the time of my visit. The advantages which the Club affords its members in the summer season are (1) the use of a reading-room, tolerably well supplied with daily papers, and also with weekly papers, both London and local, and, moreover, having on its shelves about 100 volumes of books, of which the members can avail themselves at will; (2) the use of a room in which to smoke and talk; (3) the use of a room in which to play chess, draughts, or dominoes, and of the boards and pieces with which to play those games; and (4) the use of a *recreation-ground*, and of the necessary appliances for the games of cricket and quoits. The recreation-ground is a field of four or five acres, situated at about five minutes' walk from the Club-house, and the members of the Club have the privilege of using it on two evenings per week, for which the Club pays £2 a year. The Club does not possess either a skittle-ground or a bagatelle-board. The landlord of the recreation-ground would probably be willing to allow skittles to be played there, but some of the more influential honorary members, and also some of the ordinary members, have an objection to the introduction of that game. The same members also object to bagatelle. In winter, the Club offers a greater variety of means of amusement than in summer. Last winter a 'free-and-easy' was held weekly, and both a weekly discussion meeting and a weekly 'judge and jury' were attempted. The 'free-and-easy' was very successful indeed, but the 'judge and jury' was even more so, as long as it was kept up. Some of the honorary members, however, did not approve of it, and it was, therefore, very soon discontinued. The discussion meeting failed through bad management. During a great part of last winter 'Penny Readings' were given, in connection with the Club, once a week, and were eminently successful. The members of the Club were admitted free, the 'penny' being charged only to non-members. The readings were at first given in the Club-house; but the Club-house was soon found to be not large enough to accommodate all who wished to come to them, and they were afterwards held in the 'Savings Bank Room,' a room belonging to the Savings Bank of the town, and the use of which, for occasional meetings, is handsomely allowed to the members of any benevolent or other useful society, at no charge beyond that of the bare cost of cleaning and lighting—not amounting to more than 2s. per evening. In the case of the penny readings, this cost was paid by some of the honorary members, so that the whole of the receipts were clear profit to the Club. These profits averaged between 6s. and 7s. per week. One concert was also given last winter in connection with the Club, the singers and performers being some of them members of the Club and some of them not. The Assembly Room of the —— Hotel was hired for it, and the public were invited to attend on payment, the members of the Club being admitted free. Although the expenses of the concert amounted to over £2, a clear balance of profit remained to the amount of £1 5s. The Club also tried, last winter, the experiment of lectures, but it was not attended with any great success. Still less successful have been its few attempts at establishing *classes*. The most promising of these was an attempt at a singing-class, but the first meeting of this class in the Club-house was its last. It met one evening in the games-room (a kind of cellar under the conversation-room), but the conversation going on above so interfered with the singing, and the singing so interfered with the conversation, that everybody at once saw that a singing-class, under the circumstances, would not do. The class, however, is still in existence, and consists exclusively of members of the Club; but it has only four members, and it does not meet at the Club-house. In the summer it meets for practice on the top of a hill about a mile from the town, and in winter at the lodgings of one of its members.

"As regards the financial position of the F—— Club, the first point to be noted is that the Club is still in debt in respect of the cost of adapting and furnishing the Club-house at starting, three years ago. Last year, however, it reduced its debt from £60 5s. 3d. to £33 0s. 11d. If a similar amount of reduction can be effected *this* year, the debt, it will thus be seen, will thereby be nearly extinguished. So far, the reduction of the debt has been effected solely by *donations*, the current expenses of the Club swallowing up the subscriptions alike of the ordinary and of the honorary members, and not being wholly met thereby. The most liberal donor has been the Earl of R——, who gave £20 last year, and who has contributed most handsomely to the funds of the Club during each previous year of its existence. Until last year, the expenses of the Club exceeded its total income from subscriptions, and so had to be met in part out of the donations. A new committee, however, was elected at the beginning of last year, and its management has been more economical than that of its predecessor; and the result is that the subscriptions of its honorary and ordinary members together now just about meet its current expenses. *If the Club were out of debt*, therefore, it would not need to ask for donations; but, as its honorary members at present contribute more than half its total income from subscriptions, it would still be very far from being supported by its working-men members alone."

It will be noticed that the honorary members in this instance exercised administrative control in two or three matters of considerable importance to the well-being of the Club. I do not presume to say whether their decisions were right or wrong; but when we look to the rules of this

---

* Continued from page 279.

Club, and find it was exercised, as in previously-mentioned cases, by means of a Gentlemen's or General Committee sitting and acting distinct from the Working Men's Committee, we need not be surprised that the Club has not been more successful. It has done and is doing decided good; but very little compared with what one would desire. It has sustained a great loss, moreover, in the death of one of its best friends among the gentlemen, whose kind and genial disposition greatly helped the movement at its outset.

Our friend's next remarks will be specially interesting to clergymen and other persons desirous of establishing or maintaining a Working Men's Club in *rural districts*.

"In imitation of the club at F——, a very interesting little Club (of whose existence, I believe, the Union is not aware) has been established at S——, an agricultural village, containing about 1,000 inhabitants, situated at about four miles from F——. This Club was started about eight months ago, chiefly by the efforts of Mr. ——. It has about forty ordinary members, nearly all of them agricultural labourers, each paying either 1d. a week, or 1s. a quarter, and either three or four honorary members, who have agreed to pay half-a-guinea a year each. The Club hires, at a rent of 3s. a week, two rooms in a little cottage, one of which rooms is used as a reading-room, the other being devoted to smoking and conversation. The furniture of the two rooms was completely paid for out of the first quarter's subscriptions, aided by donations to the amount of £2, and at the end of its first quarter the Club was entirely out of debt; but at the time of my visit to the neighbourhood it was in debt about £1. It possessed no library, no recreation ground, and no games, either indoor or outdoor, and its reading-room was very scantily furnished indeed. Many of its members cannot read, but some of those who can read are in the habit of reading aloud to the others. During its first quarter it devoted every Monday evening to a formal reading meeting; and on one occasion Archdeacon ——, who holds the living of S——, and on another the Rev. —— acted as reader. The most frequent reader, however, was the excellent secretary of the Club, Mr. ——. This little Club seemed to me to be eminently deserving of whatever recognition and assistance could be accorded to it by the Union."

It is very satisfactory to find, as we do in many rural parishes, that a social Club can be successfully maintained, if only two or three men of education and kindly feeling will devote themselves to conducting its operations. Of course it is vitally important that they should get the men themselves to do as much for its management as possible; and a great secret of all sucessful adminstration, of course, consists in obtaining the co-operation of efficient agents. But there must be a "head" in every enterprise.

"From S—— I went to C—— (an agricultural town with 7,000 inhabitants), in which town there is a very successful little Working Men's Club. It is accommodated in rooms connected with a very commodious and well-appointed hall belonging to the local Temperance Association. That association is very successful and energetic; and in the winter season lectures, concerts, and other entertainments are provided by it at very frequent intervals. The members of the Club have free access to all these, so that the Club has no need to provide entertainments for itself. As rent for the rooms it occupies, the Club pays to the Temperance Society only £4 a year, but it also pays £5 a year towards the salary of the Society's hall-keeper, who acts also as manager of the Club. A portion of the Society's building is open to the public during the whole of each day, except Sunday, for the sale, at the lowest remunerative prices, of teetotal refreshments, and from this department the members of the Club can be supplied at pleasure in their own rooms. These rooms, at the time of my visit, were only two—one used as a reading-room, and the other appropriated to games; but Mr. ——, to whose earnestness and liberality the Club is in many ways so deeply indebted, was contemplating adding to the building, at his own expense, a room to be devoted to smoking, &c. The Club possesses a library of 250 volumes, which are lent out to the members, and its reading-room is very amply supplied with newspapers and magazines. The number of ordinary members on the books at the time of my visit was forty-six, of whom twelve were in the habit of paying 1s. 6d. per quarter, and thirteen 6d. a month. The rest paid 1½d. per week. Last winter the number of members averaged eighty-one, and the Club-rooms, which are but small, were frequently crowded to inconvenience. The Club published its first annual report on the 1st of March last, when it had a balance of about £7 in hand. The total expenditure for the year had been £61 11s. 7d., of which about *one-third* was derived from the subscriptions of ordinary members."

Our friend speaks warmly of the good being done by the Club at C——, although the number of members, in proportion to the population, is certainly very small. But this is only one among many proofs, first, that we cannot always measure social and moral influences by numbers; and, secondly, that the benefits to be derived from Working Men's Clubs must not be expected to be appreciated rapidly or extensively for some years to come. Their friends and promoters may be thankful and hopeful, even though they have a much more up-hill work to do than they originally anticipated. The committee of the Club in question, in their first annual report, show that they well understand this, and "refer with pleasure" to their belief "that many of the homes of the working men have been made happier through its instrumentality." Thankfulness and hope need not diminish earnest effort after greater success, nor lessen a genuine desire to discover and avoid sources of error.

WORK IS NOBLER FAR THAN PLAY.

Make the most of ev'ry blessing,
Cultivate contentment here;
There are treasures worth possessing
For the men of ev'ry sphere.
Though thy lot in life be humble,
And thou toilest day by day,
Battle onward, never grumble—
Work is better far than play.

What tho' fortune crown thy neighbour?
Riches cannot banish care;
And there's dignity in labour
Which the idler cannot share.
Those who toil uphold the nation,
Keep its greatness from decay;
In each honest occupation,
Work is better far than play.

On the scaffold heav'nward climbing,
Deep within the mine below,
'Mongst the hammers loudly chiming,
And where molten metals glow—
In the fields where birds are singing,
On the vessel's deck so gay—
There are voices ever ringing,
"Work is nobler far than play."

W. Talbot.

LAW AND LABOUR.

Just at the present moment every fresh illustration of the anomalous condition of the laws which regulate the social relations of wealth and labour is more than usually interesting. Such an illustration—and that of the most pregnant kind—is furnished by the judges' arguments in the case of Unwin *v.* Clark, tried in the Queen's Bench last Saturday. We say the judges' arguments, for there was really a rather long discussion between the three justices—Blackburn, Mellor, and Shee—as to the interpretation of the existing laws regulating contracts between employers and artisans; and the judgment, unwillingly acquiesced in by Justice Shee, appears so unsatisfactory that we can only trust that the point will be speedily raised once more, and tried, as Justice Blackburn recommended, in the Court of Common Pleas. As almost everybody who is not an artisan of some sort or other is an employer of labour, the question is really important to us all. The facts of the case are as simple as possible, and there is no controversy about them.

A working cutler, named Clark, made a contract with Messrs. Unwin and Rogers—of whom it may be said that their penknives are in everybody's pocket—to work for them at certain wages for two years. Last November he refused to work any longer, except at advanced wages, and was accordingly convicted of a breach of contract, and sent to prison for three weeks. On coming out he still refused to work, was again prosecuted, and is now again convicted by a judicial sentence, which, as Judge Shee forcibly argued, is equivalent to an admission of the principle that a man may be kept in prison by repeated prosecutions and convictions for the whole time of his original contract, be it two months, two years, or twenty years. That upon any rational principle, as distinct from legal hair-splittings, the law of contracts should be thus interpreted is so "monstrous" an absurdity—as Judge Shee did not hesitate to call it, even while submitting to his brother justices—that we can hardly imagine that the present conviction can be sustained. The argument by which Justice Blackburn maintained that the man must be punished again and again is to the ordinary understanding simply amazing. If a man who has been sent to gaol for beating his wife beats her again when he comes out, of course he is again punished, *ergo*, argues Judge Blackburn, one single civil offence—namely, the breach of a definite agreement—is to be punished as if it were a criminal act repeated again and again after every fresh penalty. No wonder the real merits of the case were argued by the judges on the bench rather than by the counsel at the bar.

The practical conclusion of the whole matter is that there is an urgent call for a revision of the laws regulating the employment of labour. If the working man had as many wise friends as he has zealous friends and misdirecting leaders, it would not have been left to some future reformed Parliament to place the labourer and his employer on strictly equal terms in the eye of the law. If the mere possession of a vote is a benefit to the artisan, as we are told, how far larger a benefit would it be to him if there were no longer one law for the capitalist and another for the artisan! As the law now stands, the employer can punish the breach of a contract on the part of a workman by a heavy, and it may be a ruinous penalty; but no such punishment can be inflicted upon the employer if he is the breaker of the agreement. It is the case of bishops and curates over again. Whatever the misdemeanours of a rector or vicar, a bishop can only punish him by a regular legal process; and whatever the misdemeanours of a bishop or archbishop, nobody knows how he is to be got rid of. The curate, on the contrary, may have his licence withdrawn at the simple will of a bishop, who is not bound even to assign the smallest reason for the exercise of his despotic power. It is not, however, worth the while of any ambitious politician to make capital out of the woes of curates or working cutlers; and, at the same time, no one seems to perceive that it is in the existence of such real injustice that strikes take root and draw their vital power. Statesmen do not seem to see that so long as labour and capital combine rather as natural enemies than as natural friends, these incessant conflicts and combinations must necessarily be continued, paralysing the healthy action of trade, and inflicting sometimes irremediable mischiefs upon all concerned. And yet, setting aside the political aspects of the labour question, there never was a time when the establishment of perfect justice to all parties was more loudly demanded. More and more the relationship between labour and capital assumes the nature of a conflict, in which the sole practical question is as to which side is the strongest. Passion takes the place of sense, and the natural laws of supply and demand, which ought to regulate the distribution of profits between employers and employed, are perverted to the service of anti-social prejudices. And yet, in the meantime, by the quiet working of these laws, a complete equality of rights has been achieved by a class of labourers who, whatever else they can do, can certainly never strike or form themselves into trades unions. Cooks and housemaids are triumphant while the men of Birmingham and Sheffield are still toiling at a disadvantage; at least, we never heard of even the most revengeful of "mistresses" sueing a runaway servant girl for breach of contract, and getting her sentenced to twenty-one days' imprisonment. In every household one law is practically supreme. If you turn away your maid without a month's warning, you must pay her a month's wages. If she discharges herself within the month, she cannot claim any payment. If good servants are scarcer every year, it is not because they are unfairly used, but because, while servants become numerically fewer, there is a perpetual increase in the number of well-to-do families who want servants to wait upon them; and because, unfortunately, the machinery which has entered everywhere else into the manufacture of necessities has not yet achieved the cooking of our dinners or the sweeping of our carpets.—*Pall Mall Gazette.*

THE FACTORY OPERATIVES OF BRADFORD.

Mr. Redgrave, inspector of factories, in his annual report, says:—When I was in Bradford (in October last) I had some conversation with Mr. Poppleton, the certifying surgeon for the town, upon the subject of the physical condition of the factory operatives as compared with that of other operatives. Mr. Poppleton examines weekly more children and young persons than any other certifying surgeon in my district, and from his long experience and his judgment is well entitled to form a sound opinion. I asked him to give me, in writing, the result of his observations during the year; for he had paid much attention to the effect of employment upon health, as evidenced by the condition of the young persons brought before him in the factories, and he has sent me a very interesting report. He says:—"There has been a very large increase in the number of hands presented to me for examination during the past year. Several causes have been at work to produce this change; the principal one, in my opinion, being the large number who have left other employments for factory labour, such as machine makers, ironfounders, colliers, brickmakers, and other trades requiring greater physical

exertion than factory labour, or such as are exposed to more danger and discomfort. Another cause may have been that the heated state of the rooms in factories during the past summer has made the hands restless and indisposed to work the whole week, the high rate of wages enabling them to be careless in this matter. With regard to the hands introduced from other employments, by far the greater number come from machine shops, iron foundries, and collieries. I am happy to be able to report on the improved physical appearance of our factory people. Since hand-combing was removed from the dwellings of the operatives, their children have increased in health and size, and more especially so since good trade has raised the price of labour to a height never before known. They now surpass in appearance most other operatives, and are especially superior to workers in iron. All the children presented to me who have worked in machine shops or foundries are exceedingly pale, diminutive, and most pitiable looking objects, and altogether unfit for continuous work. The physical appearance of the collier is superior to that of the worker in iron, but the countenance of the latter is very expressive of the condition of mind which may be expected from the nature of the occupation." Since sending that report, Mr. Poppleton has given me the following account as an instance of what comes before him, and upon which his opinions as above expressed are founded:—"Yesterday I was at Messrs. ——, and on a batch of hands coming before me I selected one who appeared under age. On asking him where he worked last, his reply was at a machine shop. I remarked that his appearance would make one believe that he had worked in the pit. The lad at once replied that before the machine shop he had been a collier for three years, and that he was sure he was fifteen years old. So certainly do these employments stamp their effects on our young people. There was a few days ago a very severe accident from a machine shop of a child about ten, and he told me that he never worked less than from six to six, and sometimes till nine p.m. The physical exertion of these children is as great as the men."

This contrast of the effects of labour in iron works, as compared with the results of factory labour, which is under due restrictions, is very important at the present time, when so much attention is turned to the condition of persons employed in the metal manufacturing districts. The half-time system has been in existence at Bradford for years, several firms employing as many as 200 half-timers, some even as many as 400 and 500, and no town contains a better opportunity for the contrast between restricted and unrestricted labour than Bradford. In every part of my district there is a scarcity of hands, and partial strikes are taking place in separate departments in the mills. The certifying surgeons inform me that they are called upon to examine an increasing number of children and young persons desirous of obtaining factory employment, and a very large number of those presenting themselves are rejected as being under the prescribed ages. It is at a period like this, when the demand for labour is so active and the price of labour is so high, that the services of the certifying surgeons are of most value; for unless there were some certain check to the employment of children of tender age, who would be unequal to the work, a serious injury would be inflicted upon the young in a manufacturing district. It appears from the present scarcity of labour that if all the existing factories are to run full time there must be some great improvements in machinery, or the rate of wages must rise considerably higher than it is at present. In fact, this is beginning to be felt severely in some places, and the introduction of machinery is progressing.

A manufacturer writes to me:—"Had we not latterly introduced a large amount of machinery to substitute for hand labour, we should have been in serious difficulty;" and a short time since, speaking with an eminent manufacturer upon this subject, he quoted two instances in his own works that had occurred within a week, showing how rapidly the wages were advancing. One application was from the woolsorters, who applied for an increase of 3s. and 2s. per pack. They founded their claims upon the increased price of provisions, clothing, rent, &c., and they added:—"If you direct your attention to the general advance in wages of other branches of labour, you will find that we are not sufficiently remunerated to maintain that social position in society we heretofore have done." The second application was from the warp twisters, who in seeking an advance concluded with the following N.B.:—"We expect a satisfactory answer to this on or before the 18th instant (two days after the date of the application), or else you must look out for some fresh men, for we shall do no longer, except you will give it us." The great increase in wages has also had an effect upon the supply of labour by rendering some classes of operatives independent of their children's earnings, who are consequently not sent into factories at so early an age as formerly. Mr. Poppleton, of Bradford, has observed this, and he attributes some portion of the diminished production of goods to this cause; he says upon this subject:—"I have also to report on the great scarcity of hands during the past nine months, caused in some measure by the parents withdrawing their children altogether from work. This remark applies to the better class of factory operatives, the high rate of wages which they have at command enabling them to dispense with their children's earnings (once so important to them), and to send those children continuously to school. This scarcity of hands has led to the stoppage of so much machinery as to diminish by one-fifth or one-sixth the production of the manufactured goods. Night work has been more common during the past year than it has ever been since the passing of the Factory Act; and, owing to the scarcity of hands, masters have been glad to employ for night-work young men who can command from 17s. to 20s. per week, instead of the ordinary pieceers from 7s. to 9s. per week."

THE BOOKS THAT WORKING MEN READ.

The fourth annual report of the Blackburn Free Library and Museum has just been published. From it we learn that during the year of 365 days, commencing on the 15th of February, 1865, and ending on the 14th of February, 1866, the library was open 304 days and closed 61 days. The total number of volumes consulted and circulated in the year was 34,266. The number last year was 34,497. There is a slight increase (181) in the issues of the lending department, and a small decrease (412) in those of the reference department. The relative proportions of the various classes of books called for do not materially vary. The accompanying table will furnish the exact classified statistics:—

	Theology and Philosophy.	History.	Politics and Commerce.	Sciences and Arts.	Literature and Polygraphy.
Reference .	63	1,024	95	1,665	2,955
Lending .	293	4,880	211	1,370	21,709
Totals .	357	5,904	306	3,035	24,664

The largest monthly issues were in March (3,229), November (3,334), and January (3,248); the smallest was in July (2,359). Below is shown the average number of issues of each volume in the five classes. The table refers only to the lending library:—

	Vols. in lending department.	Issues during year.	Average issues per volume.
Theology and Philosophy .	123	294	2½
History	1,912	4,880	2½
Politics and Commerce . .	125	211	1¾
Sciences and Arts	482	1,370	3
Literature and Polygraphy .	2,161	21,709	10
Totals	4,803	28,464	6

A few examples are appended of the number of times certain volumes taken at hazard have been borrowed during the year from the lending department:—Theology and Philosophy: Bunyan's Pilgrim's Progress, 18; Taylor's World of Mind, 19; Coleridge's Method, 11; Paley's Natural Theology, 6, Plato, 4. Biography: Charlotte Brontë, 16; Wellington, 14; Mary Stuart, 14; Carlyle's Cromwell, 12; Heroes of Europe, 13; Wraxall's Criminal Celebrities, 13; Macaulay's Biographies, 10; Forster's Life of Goldsmith, 10; Working Man's Way in the World, 9. Travels: Adventures in Borneo, 19; Irving's Captain Bonneville, 39; Chaillu's Equatorial Africa, 18; Ballantyne's Hudson's Bay, 13; Hertzen's Exile in Siberia, 14; Russell's Diary North and South, 11; Borrow's Wild Wales, 10. History: Macaulay's England, 13; Traditions of London, 13; Story of the Peninsular War, 11; Bede's Ecclesiastical History, 14; Thiers's French Revolution, 11; Baines's Cotton Manufacture, 11; Kinglake's Invasion of the Crimea, 8; Chambers's Scotland, 8. Politics: Brougham's Political Speeches, 6; De Tocqueville's Democracy in America, 8; Mill's Representative Government, 8; De Lolme's British Constitution, 7; Our Homeless Poor, 13. Science: Mathematical Science (Orr's Circle), 10; Facts for Everybody, 16; Timbs's Curiosities of Science, 10; Magic of Science, 11; Triumphs of Invention, 9; Carpenter's Animal Physiology, 7; Science Popularly Explained, 8; Lyell's Antiquity of Man, 6. Poetry: Burns (two copies), 30; Addison, 13; Coleridge, 13; Shelley, 11; Wordsworth, 6; Virgil, 7; Bloomfield, 15; Songs of England, 14; Tennyson's Enoch Arden, 13; Southey's Joan of Arc, 11; Byron's Hours of Idleness, 10; Bulwer's Dramas, 11; Moore's Irish Melodies, 10; Hood's Whims and Oddities, 16; Sheridan's Dramas, 6. Essays and Miscellanies: All the Year Round, 22; Family Friend, 18; De Quincey's Confessions, 15; Lowell's Biglow Papers, 16; Swift's Gulliver, 18; Five Hundred Anecdotes, 16; Cassell's Elocution, 17; St. James's Magazine, 15; Sala's Accepted Addresses, 14; Hannah More's Miscellanies, 10. Prose Fiction: Eton School Days, 45; Marryatt's Jacob Faithful, 33; Kavanagh's Daisy Burns, 30; Wilson's Tales of the Borders, 28; Braddon's Eleanor's Victory, 43; Collins's Woman in White, 44; Trollope's Barchester Towers, 21; Yonge's Hopes and Fears, 22; Ainsworth's Crichton, 32; Hugo's Les Miserables, 20; Sala's Captain Dangerous, 21; Scott's Rob Roy, 36; Dickens's Pickwick, 35; Wood's East Lynne, 44; Lever's One of Them, 35; Oliphant's Harry Muir, 23; Disraeli's Alroy, 19.

The borrowers' cards granted to the 14th February, 1865, numbered 2,647, and in the present year the additional cards taken out have been 491. The total number of borrowers now on the books is 3,138, 2,652 of whom are males, and 486 females. The fines which have been imposed during the year for overdue volumes, &c., have produced the sum of £15 0s. 6d. Eight volumes which have been issued during the year are now considerably overdue, but these, with one or two doubtful exceptions, are believed to be recoverable. Five volumes have been lost, and replaced by the losers. Some thirty volumes have only been returned on the librarian's application.

Things Talked About.

Every Englishman who lives by the work of his hands takes an interest in Mr. Gladstone's Budget, because he knows that a large portion of the surplus revenue—and Mr. Gladstone generally contrives to have a surplus—will be devoted to the lightening of some impost which has hitherto borne heavily on those who have little to spare. That the reductions this time are small, is owing to the fact that the surplus in hand would not allow the Chancellor of the Exchequer to deal with the larger claims pressed upon him with such pertinacity. So the consideration of the duty on malt and the sugar duties must be postponed, though, doubtless, only for a time. In the meanwhile the policy is pursued of getting rid, or reducing, various small imposts or inequalities which cause considerable trouble, and lead to many petty frauds. Pepper will, supposing the Budget to be accepted, henceforth be free of duty, and it may not be worth the while of the small dealer to adulterate it with the odious rubbish now so commonly employed. The duty on timber is to be abolished, with what effect on the building trades we must wait to see. Each previous reduction of the duty—at one time as high as 56s. 6d. a load, and now only 2s. and 1s.—has been followed by an immense increase of consumption, and the rule will probably hold good now. An equalisation of the wine duties promises to make the light, nutritious wines of Burgundy, Hungary, and Greece still more accessible to persons of moderate means. The remainder of Mr. Gladstone's scheme is of less immediate interest, demanding for its comprehension a wider acquaintance with financial science than falls to the lot of most people. But one fact is easily recognisable, and that is that the scheme is framed in accordance with high principle, and not with mere expediency.

A general meeting of the Art Workmen's Association of Manchester has been summoned to consider a scheme proposed by Sir J. Kay Shuttleworth, Dr. Fairbairn, Mr. O. Heywood, and others, for holding a general exhibition of all the principal manufactures in Lancashire. A wise suggestion has been made that it would be better to defer the exhibition until the year after next, when the Paris Exhibition will have terminated.

We are sorry to hear that the announcement that the Sheffield dispute had been settled is premature.

Tempted by the revival of trade in Lancashire, a number of "foreigners," as they are called—workpeople from other districts of England who have been temporarily employed in the cotton manufacture before the famine—have returned to Bacup and other towns where operators are in demand, and some of the mills are running short time, not for want of work, but of hands. We regret to hear that some of the old hands object to the presence of these "foreigners," an unreasonable objection when there is plenty of work for all.

The Wolverhampton Chamber of Commerce has approved of the passing an Act respecting the employment and education of children in factories, with certain reservations, which may be thus summed up: "That no child under ten years of age should be employed; that children between ten and thirteen years of age should not be employed for more than half a day, and should be required to bring a certificate of attendance at school the other half; that there is no necessity for the interference of Government with the hours during which young persons between thirteen and eighteen years of age and women are employed; that the limitation of age at which young persons may be employed in night sets should not be above fourteen; that no such Act (as the Factory Act) should be introduced, unless it be applied to all places in the United Kingdom in which trades of the same kind are carried on;" and "that it should be distinctly understood that all workshops, however small, in which the affected trades are carried on, must be considered factories."

From the same town we hear that a code of arbitration rules, specially applicable to the plastering trade, have been agreed to. There is already a court of arbitration for carpenters, composed of twelve arbitrators—six men and six masters; and now the plasterers have agreed to establish a similar court; and both courts are, there is no doubt, rendered still more useful by the introduction, at the suggestion of one of the men, of a provision for conciliation with a view to make, in many instances, even arbitration unnecessary. In minor matters, and in personal dispute, the man will choose one of the trade arbitrators for the men, and the master one of those for his class, and they will meet, hear the case, and if they find they cannot conciliate the disputants, then the whole of the trade arbitrators will be called together by the umpire to decide the matter.

The fifteenth annual report of the Amalgamated

Society of Engineers, Machinists, Millwrights, &c., has been recently issued, and shows that during the year £28,500 was added to the previously accumulated fund. New members numbered 3,583, and at the end of December there were, in all, 30,978 members. The accumulated fund amounted to £115,357 13s. 10½d., although the expenditure on the year had been £49,172 6s. 2d. About seventy of the branch societies have deposited £24,000 in Post-office savings banks, and the general secretary says that "many more will avail themselves of this privilege." Within the year members out of employment received £14,070 4s. 9d., £13,785 14s. 9d. was paid to those who were sick, and £5,184 17s. 4d. to superannuated members. Such is the working of one of the largest and most influential of trade organisations, with nearly 40,000 members, and an available fund of nearly £116,000 safely invested.

Sir Morton Peto presided, a few evenings since, at the third triennial festival of the Railway Guards' Universal Friendly Society. Railway servants are peculiarly liable to be disabled from work; and the value of such a society can scarcely be too highly estimated. Since the establishment more than £1,000 annually has been devoted to the relief of the members.

The travelling public had been led to expect a great boon, for the London and North-Western and the Manchester, Sheffield, and Lincolnshire Railway Companies advertised that their fares between London and Manchester had been revised and reduced, the reduction to take effect from the 1st of May. The reduction has taken place, and it amounts to this—first-class passengers between London and Manchester will be charged *sixpence* less; second-class, *nothing;* third-class, *twopence!* There is a boon to talk about!

Another reduction will be more readily welcomed. London milk will be cheaper. Since the outbreak of the cattle disease, London dairymen have received milk from the country, at the wholesale price of 2s. and 2s. 4d. the barn gallon of eight quarts. The price is now lowered to 1s. 8d. and 1s. 10d.

Co-operative Intelligence.

Wallsend.—At the fifteenth quarterly meeting of this society, the report read showed that goods to the amount of £2,202 10s. 4d. had been sold during the quarter, leaving a net profit, after paying all expenses, of £261 6s. 11½d., which was disposed of as follows:—£12 9s. 4½d. to reduction of fixed stock, £14 18s. 6d. interest on £1,194 £1 members' shares, at the rate of five per cent. per annum; £8 2s. 8d. to reserve fund, and £225 16s. 5d. dividend on members' purchases, at 2s. 3d. in the pound, non-members being returned five per cent. on their purchases at the time of making them. The number of members on the society's books is 284, being an increase of seventeen during the quarter.

Backworth.—At the ninth quarterly meeting of the Backworth Industrial Co-operative Society, the secretary, Mr. John Adams, read the quarterly report, which showed that the society was in a very prosperous condition. The sales at the store had amounted to £1,824 1s. 4d., being an increase of more than £400 over the preceding quarter, and after the payment of all expenses, a dividend of 2s. in the pound was declared. During the quarter six members have left the society owing to removals, and thirty-six have entered, making a total of 182 members on the books.

Sheffield Improved Provident Co-operative and Industrial Society (Limited).—The first annual balance sheet and general statement of the transactions of the society for the past twelve months show the amount of cash receipts for goods sold to be £2,417 15s. 2d., and the net profit (after allowing interest at the rate of five per cent. on all paid-up shares, reduction on the fixed stock commencing the second half-year, at the rate of five per cent.) to be £82 7s. 6d., in the disposal of which the committee recommended £5 to be laid aside to start a reserve fund, 6d. in the pound for non-members' purchases, 7d. for the first and 1s. 3d. for the second half-year on members' purchases, leaving a balance of £9 4s. 4d. to meet outstanding cheques.

Dodworth, near Barnsley. Establishment of a Cheap Meat Association.—A tea-party was recently held in the Town's School-room, Dodworth, for the purpose of establishing a Co-operative meat store in this place. After tea a public meeting was held, under the presidency of Mr. Joseph Mitchell, schoolmaster, who briefly introduced Mr. J. C. Farn, of Eccles, near Manchester, who gave some advice on the object before the meeting. It is contemplated to open a store for the sale of butchers' meat as soon as the necessary arrangements can be made. The shares are to be £5 each. A meat store has also been opened in connection with the Barnsley British Co-operative Society, and on the first day the supply fell short of the demand, although upwards of 120 stones of meat was provided.

Stalybridge.—The twenty-seventh quarterly report of the Stalybridge Good Intent Industrial Society has just been issued, in which the committee congratulate the members upon "the steady and increased progress of the stability of the society," and they hope that all true, earnest, and well-wishing members participate in the same feelings. They are confident, now that the great crisis is past, still greater results may be realised by the members purchasing all they can at the society's stores, and unless they do so they cannot possibly receive or reasonably expect to realise the same benefits as members belonging to similar societies who are heart and soul in the great work of social redemption. The dividend for the quarter is 1s. 3d. in the pound to members, and 1s. in the pound to non-members.

Turton. Egerton Co-operative Society.—At a meeting of the newly-established Co-operative Association at Egerton, the secretary, Mr. C. J. Kenyon, read the first quarterly report, representing the financial account for the quarter ending 20th March, from which it appeared that the profits for the quarter amounted to £125 16s. 5½d., which, after allowing for depreciation of fixed stock and paying interest on non members' claims, allowed a dividend of 2s. in the pound on members' purchases, and 8d. in the pound on the purchases of non-members; the committee recommending the balance, amounting to £15 19s. 4d., to be carried to the reserve fund. The cash account showed the following result:—Debits: To cash received for contributions, £418 3s.; entrances, £6 7s.; sales of goods, £1,304 11s. 6½d.; for sundries, 12s. 9d.: total, £1,729 14s. 3½d. Credits: By cash paid for goods, £1,495 1s. 2d.; rent and taxes, £17 0s. 5d.; wages, £31 14s. 9d.; withdrawals, 21s.; carriage, £14 18s. 9d.; sundry expenses, £2 4s. 6d.; stock-taking, 12s.; fixed stock, £101 15s. 6½d.; cash to Rochdale corn mill, £5; and balance in treasurer's hands, £60 6s. 2d.: total, £1,729 14s. 3½d. The profit and loss account showed: Interest on members' claims, £2 14s. 8d.; dividend on members' purchases, amounting to £1,011, at 2s. in the pound, £101 2s.; dividend on non-members' purchases, amounting to £96, at 8d. in the pound, £3 4s.; amount carried to reserve fund, £15 19s. 4d.; depreciation of fixed stock, £2 16s. 5½d., thus representing the quarter's profit at £125 16s. 5½d.

CO-OPERATION IN AUSTRALIA.

Sydney (New South Wales) General Co-operative Society (Limited).—At the thirteenth quarterly meeting of this association, the secretary read the report and balance sheet for the quarter ending 31st December, from which we gather that the society is progressing favourably; and, although a slight falling off was observable in the last, compared with the previous quarter, yet the profit made was somewhat in excess of that shown at the last quarterly meeting; and the report congratulated the members upon the fact that, although the working expenses were large in proportion to the amount of business done, yet, by strict economy and careful management, they were enabled, after defraying all expenses, allowing for depreciation and the usual 7½d. per cent. upon the capital, to pay a bonus of 1s. in the pound upon members' purchases.

General Information.

CLUBS AND INSTITUTES.

Social Meetings of the Working Men's Club and Institute Union at Exeter Hall.—The third of these interesting meetings was held on Wednesday evening last to consider the following question:—Is it the duty and province of the Government and local authorities to assist the industrial classes in providing themselves with better dwellings. W. T. McCullagh Torrens, Esq., M.P. for Finsbury, having taken the chair, the proceedings were opened by Mr. T. Paterson, a working man, and Member of the Council of the Union, who read a valuable paper on the subject, illustrating his remarks by reference to a map of London, on which the extent of recent demolitions was depicted. J. Locke, Esq., M.P. for Southwark, then addressed the meeting, making special reference to a Bill on this subject which had been introduced by himself and Mr. Kinnaird. A great number of working men then addressed the meeting, which did not break up until past eleven o'clock.

Rotherham and Masborough.—Owing to the construction of the new railway line through Rotherham, the present building in which the Rotherham and Masborough Working Men's Club is held will have to be demolished. It has been thought very desirable that a society tending so greatly to the moral and intellectual improvement of the working classes should not be allowed to become defunct for the want of a suitable quarter. Holding this view, the Rev. H. M. White, M.A., the Rev. W. Blazeby, B.A., and other gentlemen, materially aided in the getting up of a "People's Hall Company (Limited)," whose object was the erection of a large edifice, in which not only the Working Men's Club might be properly accommodated, but the various friendly societies also, the members of which, in many instances, would be thus removed from the evil influences and attractions of the public-house. It was also proposed to have a large room to be let for rational entertainments. A hint being thrown out as to the readiness of the proprietors of the Rotherham Mechanics' Institute to assist the working men in the construction of a club-house, a deputation from the Working Men's Club and the People's Hall Company recently had an interview with the committee of the Mechanics' Institute, when the committee expressed their willingness to build a club-house for the working men on the plot of ground immediately adjoining the Mechanics' Institute, on the shareholders in the People's Hall Company amalgamating with the Mechanics' Institute proprietary, and taking up a certain number of shares, amounting, say, to £400 or £500.

Wisbeach Working Men's Club and Institute.—At the annual meeting of this institution, the committee's report showed that the institution, now legally constituted a friendly society, was, both financially and otherwise, in a prosperous condition.

Oldbury.—At the annual meeting of the members belonging to the Working Men's Club and Institute, the report showed that the club has been in existence for one year, and has been successful in its operations. It owes its origin to the penny entertainment movement, the profits from which assisted in its establishment. The total income amounted to £130, and the expenditure to £132. This small deficiency will be covered by some promised donations. The manufacturers of the district and friends of the movement gave £50 to defray the expenses for the starting of the club. That such an institution was required is evident from the numbers who have attached themselves to it. There have been 120 quarterly members on an average, 1,660 weekly tickets have been issued, and more than 10,000 visits have been made.

Salford Working Men's Club.—At a special meeting of the managing committee of this club, held a few days since, a proposal was made, at the suggestion of the numerous class of members, with wives and families, for a series of Saturday afternoon excursions during the summer months. The proposition was well received, and arrangements were made that the first trip (to Worsley) should take place on the 5th of May. The general affairs of the club were reported to be in a prosperous condition. The Rev. H. Solly, the general secretary to the "Working Men's Club and Institute Union, London," recently visited the institution, and expressed his gratification and surprise that so much had been done from so small beginnings, and with so little means. The working classes almost exclusively support the institution out of their own resources, and it is not in debt. Among other sources of income, the fortnightly "Penny Readings" during the winter months realised £15. These entertainments were attended on the average by 450 persons. The library has been increased, and, including a recent handsome contribution from the Rev. E. B. Chalmer, the president, contains nearly 3,000 volumes.

The Duke and the Working Men.—Some of the Working Men's Clubs and Institutes in the heart of London were visited last week by the Duke of Argyll, who is announced to preside at the approaching public dinner of the parent society. The duke was introduced to the secretaries of the respective clubs, and to such members of their committees as were present, by the Rev. H. Solly, who also explained the *modus operandi* in them, and the advantages they offer. The visits seemed highly interesting both to the noble duke and to the working men whom he visited.

EMIGRATION.

A Bolton artisan writes from Brisbane, Queensland, as follows:—"In order to give you some idea of the rapid increase of population here, I may tell you that, five years ago, a cattle market did not exist, and the city had only two butchers in it, who, perhaps, killed a couple of bullocks in the week, and could not sell all that. At the present time there are not less than 400 head of cattle consumed per week, and 1,000 sheep; that is 20,800 cattle per year, and 52,000 sheep. The progress of the colony is self-evident, when we consider that its separate existence dates only since 1859. I am not able to give you any correct information as to the population at the present time, but it is generally computed to be not far short of 90,000. In 1864 it was 61,467 persons. The revenue, in 1863, was £390,823; the imports were £173,236; and the exports, £1,888,381. When you compare these figures with the dates and the population, I would wish you to bear in mind the time the colony has been in existence, and that it is the youngest of the Australian colonies. Now, from the fact of all these works being in construction, it must follow that there must be a proportionate demand for labour. True, the demand for labour of all kinds is great, but the supply is three times greater than the demand, and is, therefore, lamentably in excess. It often happens that 1,000 persons land upon our shores in one week, and I have known 2,000; and thus the labour market is suddenly overstocked, and, as a consequence, hundreds walk the streets disgusted with the place. Some of these, no doubt, send home woeful letters to their friends. Again, there are some who ought not to have come, as they are by no means adapted for the requirements of the place. Some are, perhaps, physically weak—unable to endure the climate; some depend solely and entirely upon their 'education,' and find that they cannot get employment—they, too, will send a miserable account of their experience. All who come must be able to do something, to perform manual labour, must be able to work with their hands. Education alone is virtually useless; it may serve to direct labour, but of itself here it is not much in request."

Industrial Progress at Pittsburg, U.S.—There are now over 500 large manufacturing establishments in Pittsburg, among which are 50 glass factories, 58 oil

refineries, 31 rolling mills, 46 iron foundries, 33 machine shops, 12 boiler works, 6 large steel works, 10 brass foundries, 16 potteries, 5 cotton mills, 9 plough works, 10 establishments for heavy forging; also, a number of extensive white lead factories, chemical works, saw, axe, copper, and other manufactories of only the great staples of trade.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

THE WORKING MAN LIFEBOAT.

To the Editor of the Working Man.

Sir,—I am requested, on behalf of the Council of the Metropolitan and Provincial Working Classes' Industrial Exhibition, to thank you for so readily carrying out the suggestion respecting the lifeboat, and to inform you that we shall be most happy to place one of our silver medals at your service for presentation to the collector of the largest amount towards the fund, if such a course meets your approval.—I have the honour to be, Sir, your obedient servant, W. J. Watts, *Hon. Sec.*

7, Birchmore Terrace, Cardington Street, Hampstead Road, N.W., London, 4th May, 1866.

[As we have no doubt the medal offered will be gladly accepted and highly valued, we shall have much pleasure in becoming the medium of presentation. The first list of contributions will be published in No. 22 of the Working Man, and we shall be glad if the lists intended to be acknowledged in that number be forwarded on or before the 31st of May.—Ed.]

SHALL VICTORIA PARK BE DESTROYED?

To the Editor of the Working Man.

Sir,—I trust you will afford me the use of your columns to make known to the public the very great and serious nuisance which two powerful gas companies are about to create in the immediate neighbourhood of Victoria Park, in the confident hope that, when the outrageous grievance is made known, the expression of public opinion will be so strong and unanimous on the subject as to avert the threatened evil, and preserve this beautiful park from so great a calamity. The Imperial Gas Company have a Bill pending in the present Session of Parliament to enable them to acquire twenty-seven acres of land in the parish of Bow, and to erect thereon stupendous gas-works. There is also a Bill pending in the present Session to amalgamate the City of London Gas Company with the Chartered Gas Company; and another Bill to enable the Chartered Gas Company to acquire land at Hackney Wick, and to erect thereon gas-works of enormous size. The Commissioners of Her Majesty's Works and Public Buildings, who have the management of the public parks of the Metropolis, have not opposed the Bill; the only terms which they have imposed upon the companies are, that no gas is to be manufactured upon any lands that are within 300 yards from any part of the fence round Victoria Park. I feel quite confident that if Her Majesty's Commissioners were aware of the gigantic character of these two proposed new gas-works they would never consent to their being erected in such a locality—the works of the Imperial Gas Company will be 300 yards from the park, and the works of the Chartered Gas Company about 400 yards.

It appears from the evidence given by the Secretary of the Imperial Gas Company before a Committee of the House of Commons in 1865, and before a Committee of the House of Lords during the present Session, that the company intend to erect works on the land at Bow at a cost of about £1,000,000, capable of making 17,000,000 cubic feet of gas daily. The daily consumption of coals to produce that quantity of gas will exceed 1,200 tons. It appears also that the Chartered Gas Company intend to erect works on the land at Hackney Wick capable of producing daily 12,000,000 cubic feet of gas, to produce which will require a daily consumption of 800 tons of coal. These two gigantic gas factories will be the two largest gas factories in the world. They will be on the east side of Victoria Park; and as east winds prevail during a great part of the year, the effect which will be produced upon the park and adjoining property by the dense clouds of smoke continually emanating from thousands of retorts, consuming daily 2,000 tons of coal, and casting into the air all sorts of poisonous vapours, will be most disastrous. No such intolerable nuisance would be suffered to exist near Hyde Park, St. James's Park, Regent's Park, or Battersea Park; why, then, should it be permitted to be established near Victoria Park?

In order to have a clear conception of the extent of the nuisance which will be created, it must be borne in mind that each of these gas works will exceed in size three of the largest of the present existing gas-works in or near London put together; so that the nuisance created will be as great as the nuisance which would arise from six of the largest gas-works in the Metropolis being concentrated in one place.

Victoria Park was formed at a heavy cost to the country, for the use and recreation of the people of the north-east end of London. It is kept up in excellent order, at a very considerable annual expense; a choice selection of ornamental shrubs and trees are planted in it, which thrive remarkably well, and it has become woody, luxuriant, and beautiful. On a summer's day it is frequently visited by upwards of 50,000 persons—the hard-working population of the north-east of London having most cordially responded to the enlightened efforts made for the amelioration of their condition. But if these enormous gas-works be permitted to be erected the park will be entirely ruined; the present luxurious growth of flowers, shrubs, and trees will be blighted and destroyed; and visitors, instead of inhaling a pure and healthy atmosphere, will breathe an air vitiated with all sorts of poisonous and noxious gases. Besides the injury which will be inflicted upon the public, the owners of property in the neighbourhood will be most seriously damaged. As no necessity exists for manufacturing gas near the place where it is consumed, these companies ought not to be permitted to erect works of such vast magnitude in such a locality; and, as I have stated before, I do not believe that Her Majesty's Commissioners of Works and Public Buildings can be aware of the gigantic character of the gas factories proposed to be erected, otherwise they would at once exert their influence to prevent these Companies from obtaining Parliamentary powers to erect such extensive works so near to Victoria Park, or even so near the Metropolis itself. I sincerely hope that the matter will be taken up warmly and earnestly by these Members of Parliament who are anxious to promote the interests of the working classes, in order to prevent what would be an everlasting disgrace to the Legislature, namely, the sanctioning of measures which will enable these two powerful gas companies to inflict a perpetual curse and nuisance upon the inhabitants of the north-east end of London.—I am, Sir, your very obedient servant, P. Francis Dart, M.A. Oxon.

6, Francis Terrace, Victoria Park, April 27th, 1866.

SAVE VICTORIA PARK.

To the Editor of the Working Man.

Sir,—If the working men and working women of London wish to preserve their beautiful and much-prized park from destruction, they must bestir themselves to instant action. The gas companies are about to erect works on an unprecedented scale of magnitude in the immediate neighbourhood of the cricket lawns, and not far from Miss Burdett Coutts' splendid fountain, the effect of which will be to convert what has become the popular recreation ground of East London into a place which cannot be visited without the risk of being poisoned by the noxious fumes and vapours of the gigantic gas manufactories. If the working men of London have the least particle of spirit in them, they will not allow themselves to be tyrannised over by these reckless monopolists. Such a terrible nuisance would never be tolerated near the dwellings of the wealthy, and why should it be brought to the homes and the recreation grounds of the working man? I hope that from every workshop, from every factory, from every establishment where working men and working women are to be found, there will instantly issue such a voice of indignant remonstrance that the Government will be compelled to oppose the projects of the gas companies. There must not be the delay of a single moment if the park is to be saved. The gas companies have stolen a march upon us. They have managed to get their Bill passed by the House of Lords, and read a first time in the House of Commons. They thought they had only poor working men to deal with, and that they—the great capitalists, with their vast money power—would meet with very little real opposition to their schemes. But there is something more powerful than money. That something is Public Opinion! Let every working man feel it to be his bounden duty to resist to the uttermost this shameful and unjustifiable attempt at curtailing his rational enjoyments; let him assist in getting up petitions, which, if signed and forwarded to me, shall be presented by the right men to the House of Commons; and, above all, let him be prompt in action. The delay of an hour may imperil the safety of the park. Mr. Cowper has given it as his deliberate opinion "that no great ground of complaint could be made even if gas-works were erected within 300 yards of any buildings, provided they were properly and prudently conducted. The nuisance arising from gas-works, being entirely occasioned by the refuse of those works, could be remedied by the insertion of a clause requiring the company to remove the refuse, and to prevent the accumulation of such refuse." Would such language be used were the works proposed to be erected near Kensington Gardens? Certainly not. Then why use it with reference to Victoria Park? Are the lives and pleasures of the poor less valued or required than those of the rich? If the working men of London be true to themselves in this matter, if they undauntedly demand that the gas companies be denied the power to rob the poor of one of their most prized spots of recreation, he will be a bold man who dares oppose them. Let us all work in the good cause: let there be no delay in the matter; let every man instantly put his shoulder to the wheel, and then not only our children, but our children's children, and their descendants, will bless us for preserving to them at least one spot where the hard-worked children of toil may come forth from their unhealthy homes in the courts and lanes, for the purpose of breathing the pure and refreshing air of heaven.—I am, Sir, yours respectfully, John Plummer.

4, Homer Terrace, Hackney Wick, May 5, 1866.

THE VICTORIA PARK CRICKET CLUBS.

To the Editor of the Working Man.

Sir,—The Victoria Park Cricket Clubs ought to lose no time in petitioning Parliament to adopt immediate measures for the protection of the park from the danger which awaits it in the shape of the threatened encroachments of the gas companies. The petitions should be entrusted to Mr. John Stuart Mill, M.P., Mr. Beresford Hope, M.P., Mr. Thomas Hughes, M.P., Lord John Manners, M.P., or Professor Fawcett, M.P., for presentation to the House of Commons. A.

May 5, 1866.

TO CORRESPONDENTS.

Notice.—In answer to numerous inquiries respecting the eligibility of clerks, book-keepers, and others holding similar positions, as competitors for the prizes offered by Messrs. Cassell, Petter, and Galpin, we beg to refer our correspondents to the announcement in No. 12 of the Working Man.

Mechanic.—The phenomena alluded to by you are well known. A contemporary says:—"It is a fact known to the philosophical instrument makers, that if a metal wire be drawn through a glass tube, a few hours afterwards the tube will burst into fragments. The annealed glass tubes used for the water-gauges of steam-boilers are sometimes destroyed in this way, after the act of forcing a piece of cotton waste through them with a wire, for the purpose of cleaning the bore. This will not happen if a piece of soft wood is employed."

Laura.—We cannot undertake to reply to such trivial questions.

Artisan.—Wooden shoes (clogs) were introduced by some Flemish weavers in 1337.

J. J. W.—The first cotton mill in Glossop was erected in 1784.

S. T. O.—Yes; the Boston *Transcript* gives an account of a newly invented cotton-picking machine, hardly less important and valuable than the cotton-*ginning* machine invented by Eli Whitney. One of these machines, it is claimed, will do the work of twenty men, gathering cotton as clean as the most expert hand could do it, at distances ranging from six inches to six feet, and taking it only from the bolls which are ripe and well open, leaving the undeveloped pods uninjured, and not harming the plant.

W. S.—The discovery of mines of rock salt in this country is of comparatively late date, being not quite 100 years ago. It occurred from a search which was made for coal near the town of Northwich. In Poland, on the contrary, the salt mines have been worked for 500 years, and there the stratum of salt is in some places so pure as merely to require breaking, whereas in England it requires to be dissolved and evaporated before it is fit for culinary purposes.

J. B. K.—It is meant that you should write on one side of the *page* only, not on both sides.

Saml. Rogers wishes to obtain from a reader of the Working Man instructions for making a velocipede.

L. M. D.—From the time of Henry VI. till 1832, the qualification in English counties was the ownership of a freehold property worth a clear 40s. a year. The Reform Bill continued this qualification with a slight modification in the case of life-renters. It also admitted to the suffrage copyholders having land worth £10 a year; leaseholders having land worth £10 a year, when the lease had been granted for 60 years and upwards; and leaseholders with land worth £50 a year, when the term of the lease exceeded 20 years. A 40s. freehold gives a county vote, even when the freehold is situate within a parliamentary borough.

John Buchanan.—You do not state the nature of the difference you allude to.

Sour French Claret.—Thanks for your letter, which want of space forbids our insertiug.

A Youth of Fifteen.—Odell's system of shorthand is the best. You can procure a cheap copy at many of the second-hand bookshops.

J. James.—Some cardboard, a pencil, rule, penknife, and a little glue, paste, or gum are all that you will find necessary in making cardboard models. For the rest, you must rely on your ingenuity and skill. There is no work on the subject.

A Factory Operative.—The Bleaching and Dyeing Works Act (23 and 24 Vict., c. 78, and 26 and 27 Vict., c. 38) applies the Factory Acts to bleaching and dyeing works, with certain exceptions. Lost time may be made up by young persons and women by working until eight o'clock on the first five days, and until half-past four on Saturdays, providing the total time in six months does not exceed the time allowed by the Factory Act. Children (under 13) may not work beyond six o'clock on the first five days, and two o'clock on Saturdays. No woman or young person, however, may work more than nine hours on the Saturday, or twelve hours on any other day. If the machinery is moved by a water wheel, and, by reason of the shortness or excess of water, is stopped for part of a day, young persons and women may work during the night, except Saturday night, providing they do not work in the twenty-four hours more than the usual number of hours. The provisions in the Factory Acts as to the whitewashing of ceilings, fencing of machinery, and meal times, are not to be applied to blacking and dyeing works, and the number of hours may be worked between six a.m. and eight p.m.

Caxton: The only remedy is by an action in the County Court.—Botain: your remarks on the subject of botany shall receive due attention.—J. W. S.: The number has not yet been definitively decided.—W. O. (York): The subject treated in your letter is more suitable for the columns of a newspaper.—Designer: *Periphery* means the boundary line of a circular or curvilinear figure.—S. G. N.: The registration fee charged by Mr. J. Tidd Pratt does not exceed a few shillings. The charge is perfectly legal.—Nemo on a Pedestal: The first of a short series of papers on modelling appeared in No. 68 of *Cassell's Illustrated Family Paper*, New Series.—Truthful: We have not yet published an article on the subject.—Shirley Brooks: The refusal of the mother does not lessen the legal liability of the father.—A. B.: We are not acquainted with any works on the subject other than those named by you.—E. S. D.: We are unable to comply with your request.—A Working Tailor: Thanks for your letter and the information it contains.—Browne, Y.: Both Canada and America are alike suitable for your purpose; but perhaps the former country would prove the most advantageous.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

Morrison's Archimedian HEM-FOLDER for the Sewing Machine and the Finger. Manufactured solely by

JOSEPH GILLOTT,

Metallic Pen Maker to the Queen, Victoria Works, Graham Street, Birmingham.—Drawings and particulars forwarded on application. [4

The Original Chlorodyne, Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c.

EARL RUSSELL communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chlorodyne.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chlorodyne engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ½ oz., 1s. 1½d.; 1½ oz., 2s. 9d.; 10 oz., 11s.; 20 oz., 20s.

Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [24

Hall's "Lung Restorer" gives instant relief in Coughs, Asthma, Hoarseness, Sore Throat, &c. Mr. R. Brooke, Mirfield, near Leeds, writes, after suffering over ten years with an asthmatic cough, "Three 1s. 1½d. bottles cured me." Prepared by THOMAS HALL, Chemist, 6, Commercial Street (City side Great Eastern Terminus), London, and sold by all Chemists, in bottles, at 1s. 1½d., 2s. 9d., &c. [25

Advances made on Freehold and Leasehold Securities.
Fire Insurance at the usual rates. Duty reduced to 1s. 6d. per cent.

Forms of Proposal for Assurance, Prospectus, &c., forwarded on application to EBENEZER CLARKE, Jun., Secretary, 78, Cannon Street West, E.C. [2

£20,000 ready to be advanced by the TEMPERANCE PERMANENT LAND and BUILDING SOCIETY, on Freehold or Leasehold Property, for any period of years not exceeding fifteen, the mortgage being redeemable by equal monthly instalments. Interest (in addition to a small premium), 5 per cent. on the balance each year. Apply to

HENRY J. PHILLIPS, Secretary.

Offices, 34, Moorgate Street, London, E.C.

NOTE.—More than half a million pounds sterling have been advanced upon house property alone. [32

How to Purchase a House for Two Guineas per Month, with Immediate Possession, and No Rent to Pay. Apply at the office of the BIRKBECK BUILDING SOCIETY, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO PURCHASE A PLOT OF LAND for 5s. per Month, with Immediate Possession, either for Building or Gardening Purposes. Apply at the office of the BIRKBECK FREEHOLD LAND SOCIETY, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO INVEST YOUR MONEY WITH SAFETY, at £5 per Cent. Interest. Apply at the office of the BIRKBECK DEPOSIT BANK. All sums under £50 repayable upon demand. Current Accounts opened similar to ordinary Bankers. Cheque Books supplied. All cheques exempt from Stamp Duty.

Office Hours from Eleven till Five daily; on Saturdays from Eleven till Two, and on Monday evenings from Seven till Nine.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to

FRANCIS RAVENSCROFT, *Manager.* [33

The Planet Permanent Building and Investment Society, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

Offices—39, City Road, London, E.C. [34

THE SWEDISH CALCULATING MACHINE.

The Swedish Calculating Machine.

THE wondrous advance which has been made during the present century in human knowledge and skill, as displayed in the multifarious ways whereby time, money, and labour are economised, through the substitution of mechanical for manual power, tends almost to make one sceptical whether there be any limit to that progress.

Looking back over the last hundred years, and contemplating the marvels which are now "familiar as household words," he would be a bold prophet who would venture to predict an era when the fiat, "Thus far shalt thou go, and no farther," will bar the way in any branch of the development of man's reason and genius.

We have almost "put a girdle round about the earth," and annihilated distance by the aid of electricity, in whose subtle power lie capabilities as yet but partially known. The most intricate work possible to be done by hand is now executed with far greater accuracy and dispatch by machinery; and pretty nearly everything short of sentient intelligence is evolved from combinations of levers, cranks, and wheels, more or less complex.

The idea of employing mechanical contrivances to execute the elementary functions of arithmetic is of very ancient date. Instruments, such as computing boards, or the *Abacus*, with its rods and sliding balls, to be seen at this day in our infant schools, were employed by the sages in the very earliest periods of civilisation, to aid them in combining numbers.

In later times, and following on the discovery of logarithms, there was the invention of Baron Napier, called *Rhabdology* (since popularly known as "Napier's bones"), whereby, through the medium of a number of small rods arranged in rectangular pyramids, the principal rules of arithmetic might be worked.

Subsequently scientific men of almost every European nation, including the celebrated names of Pascal and Leibnitz, have tried to solve a problem which has, perhaps, absorbed an equal amount of thought and labour with the search for the philosopher's stone or perpetual motion. The major part of these designs consisted either of modifications of Napier's principle, or of the elaborate invention of Pascal; but none of them ever became more than curiosities of science, whose remains are yet to be met with in museums. Their complexity, slowness of working, and inexactness, rendered them altogether useless for practical purposes. Indeed, with the exception of Pascal's design, none of them are entitled to be called "calculating machines;" they were simply arithmetical instruments for performing isolated operations—scientific toys, in fact. Of course, under this classification we do not include Günther's calculating rule, or its many modifications, as that ingenious contrivance has been of real use, and is now very extensively employed by architects and surveyors.

For the *arithmometer*, invented by M. Thomas, of Colmar, in 1822, it is claimed that it is endowed with "une véritable intelligence," and that it executes all ordinary arithmetical operations, without fatigue to the operator; but of this instrument we are not in a position to speak from personal acquaintance with its merits.

There is one thing in the history of calculating machines beyond all question, which is, that the honour of originating and actually establishing by proof, the idea that machinery could be made available for much more extensive functions than any hitherto thought of, and that the results of such operations might be simultaneously printed, belongs to our highly-gifted countryman Mr. Charles Babbage. From his recently-published book, "Passages from the Life of a Philosopher," we learn that the idea of a calculating machine first struck him in 1812, when studying a table of logarithms. Pursuing this thought, he came to the conclusion that a machine to execute the isolated operations of arithmetic would be of comparatively little value, unless it would work with very great rapidity and accuracy, whilst the method of differences supplied a general principle by which *all* tables might be computed mechanically; and to ensure accuracy, he required that the same mechanism should print whatever tables it computed.

It would carry us far beyond the scope of our present purpose were we to enter into a full explanation of the mathematical principle which lies at the root of Mr. Babbage's conception; but it is impossible to convey to our readers any correct idea of the elaborate machine we have to describe unless we touch, however briefly, on the end for which it was designed.

The method of finite differences is that by which, when any given points in certain series of numbers are known, the intermediate terms can be calculated from those points. It is therefore applicable to numerical tables in which the values increase or decrease, according to some general law. Now, a column of the natural numbers from 1 to, say, 10,000, would increase in arithmetical progression by the constant addition of 1; so, if we write 1, 2, 3, 4, &c., and begin to subtract the less from the greater consecutively, we shall find that the difference between each term is 1 invariably. The series, therefore, is of the simplest character, and requires but *one* difference in its construction.

Next in order would be a table composed of the *squares* of the natural numbers, which would

involve *two* differences; and higher still, a table of the cubes, or third powers of the natural numbers, would require *three* differences. The following examples will illustrate the application of the differential method to such a table:—

Natural Numbers.	Cubes of the Natural Numbers.	1st Difference (δ^1)	2nd Difference (δ^2)	3rd Difference (δ^3)
1	1	7		
2	8	19	12	
3	27	37	18	6
4	64	61	24	6
5	125			

We see here that if we continued this table to an indefinite length, by taking the difference between each of the cubes, then the difference of those first differences, and then the difference of those second differences, the last of the differences would remain invariably 6 to the end of the chapter. From just these few figures, then, we could deduce a table of cubes to any extent, and we should start the calculation by writing down in this way:—

δ^3	δ^2	δ^1	First term of the Required Series.
6	12	7	1

subsequently proceeding as follows:—

δ^3	δ^2	δ^1	Terms of the Required Series.
6	12	7	1
6	18	19	8
	24	37	27
		61	64
			125

and so on to the limit of the series.

Following out the same principle, a table of fourth powers would involve *four* differences, and so on for higher powers.

We have thus far spoken of the most simple form of numerical tables, where the increase is regular and by arithmetical progression only; but the differential method is even of far greater use in the construction of tables where the increase or decrease is in geometrical progression, and is either regular or fluctuating. Huge volumes there are of all sorts and sizes, containing we should be afraid to say how many millions of figures, in the shape of tables of interest, logarithms, navigation, and astronomy, as well as the necessary tables for insurance wherein the probabilities of life are combined with the interest of money. All these lie within the compass of the same method; all require immense time and labour in their calculation; and in all, the difficulty of avoiding clerical and arithmetical error, even under the most stringent precautions, is almost insurmountable.

Taking the mathematical principle which we have endeavoured to shadow forth as his guide, Mr. Babbage determined to put his ideas to the test of experiment, and, in 1821, he produced his first machine—or, as he properly calls it, "Difference Engine No. 1." This was only a small matter, but it sufficed to demonstrate the practicability of producing a machine which should approach to the very verge of thinking for itself—at any rate, one to which its originator could say, "I give you the first term; from the values of the difference between that term and any given point supply me with all the intermediate terms!" In this respect our countryman takes rank as the real inventor of calculating machines proper. Mr. Babbage's success led to a commission from the Government, in 1823, for "Difference Engine No. 2," which was to possess powers far surpassing those of his original conception. After devoting many years of thought and labour, and much money from his private resources beyond the £17,000 advanced by the Government, to the production of the machine, Mr. Babbage discovered new principles, which opened up such an extended range to the power of mechanical combinations, that the old ideas were altogether superseded; and as the Government would go no further, the Difference Engine No. 2 was abandoned.

In 1834, there appeared in the *Edinburgh Review* a very able and exhaustive article, by Dr. Lardner, on the calculating machinery of Mr. Babbage. This article fell into the hands of Mr. George Scheutz, then an editor of a journal of arts in Stockholm, who derived from it the first idea of constructing a machine for the same purpose as that of Mr. Babbage. Mr. Scheutz, with the aid of his son, Mr. Edward Scheutz (a student in the Royal Technological Institute at Stockholm), so far carried out the design as to construct a working model, with printing apparatus included, which was completed in 1843. After a lapse of eight years a sum of money was awarded by the Swedish Diet to the inventors, who immediately applied it to the construction of a new and an improved machine, which was finished in 1853. The inventors visited Paris and London in 1854—5, with their machine. It was exhibited, and its principle explained by Mr. W. Gravatt, F.R.S., at the Royal Society's rooms in Somerset House, to the late Prince Consort and to numbers of scientific visitors. Subsequently it was purchased by Mr. Rathbone, of Albany, U.S., and presented by him to the Dudley Observatory in that city, where, we believe, it still remains.

We ought, in justice to Mr. Babbage, to say that his conduct towards the ingenious Swedes was above all praise. So far from betraying the least feeling of jealousy, he warmly espoused their cause, and has always borne candid testimony to the merits of their design.

Many years ago Dr. William Farr, of the Registrar General's Department, had expressed his belief that machinery such as Mr. Babbage had invented could be made available for the construction of a number of tables—in especial, tables for life insurance purposes; and having satisfied himself that the Swedish machine was in every way suitable for such operations, the Registrar General obtained the sanction of Her Majesty's Government for the purchase of a machine, to be constructed by Messrs. Donkin, the well-known engineers, from the drawings of Messrs. Scheutz, on a plan superior to their first machine.

Sir George Lewis, then Secretary of State for the Home Department, gave the necessary authority, and the result was the very beautiful piece of mechanism of which, by the courtesy of the Registrar General, we are enabled to give the illustration which prefaces this description.

The Government paid £1,200 for the machine, but we believe that that sum did not, by any means, cover the cost of construction to its makers. As soon as it was completed, it was deposited at the General Register Office, where Dr. Farr immediately put its capabilities to a severe practical test, by employing it in the differential interpolations for a new English life table, on a most extensive scale, which he was then enabled by its aid to construct. The volume containing that table was published in 1864, and it includes no less than 238 pages, calculated by the machine, and printed from stereotype plates produced from the matrices stamped by its type-wheels. Thus the nation has something really valuable to shew for its money; and it is questionable if such an elaborate undertaking would have been possible if the work done by the machine had been required at the hands of even a much larger staff of computers than would ever be available in a public department.

Next week we shall give a section of the calculating part of the machine, and describe the mechanical action which produces the required results.

"As the Homes, so the People."

A certain poet is celebrated in anecdote, who is said to have made the remark, "Let me write the songs the people sing, and I will determine what character they shall bear;" or, perhaps, he put it (for no one can tell how an anecdote centuries old was originally put), "Let me write the songs of the people, and I will answer for the character of those who cherish them and sing them." With much more truth it might be said in these days, "Let any one know the character of the habitations in which a people consent to dwell, and he might at once declare the average means they possess, the degree of refinement at which they have arrived, the nature of their social habits, and the sort of physical health by which they are distinguished." The habitations, perhaps, more than anything else in these days, indicate the general condition and character of the people. We quoted, in a recent article, a bold and significant saying of Sir John M'Neil, that "there were houses, and great numbers of them, too, of an immoral construction." Happily, this question is receiving general attention.

An able volume has lately appeared—the ablest book upon the subject we have seen—by Mr. James Hole, of Leeds, entitled "The Homes of the Working Classes." The volume, which is large and handsomely got up, is published under the sanction of the Society of Arts. It bears the motto which we have placed at the head of this notice, from the pen of Mr. George Godwin, one of the chief authorities we have upon the subject. Mr. Hole, who is practically acquainted with the subject—there having been more attention paid to it in Leeds than in any other town—not only brings to bear upon his exposition of the homes of the working class his own experience, but accompanies it with practical suggestions for the improvement of working men's houses. His book is dedicated to Mr. Akroyd, M.P., who has built a township which bears the name of Akroydon. Mr. Hole's "Homes" is accompanied by a series of plates and plans of overlookers' and workmen's dwellings, erected at Saltaire, Copley Village, and Copley Houses, Model Cottages of Leeds, of West Park, Halifax; and the handsome model buildings erected by Mr. Alderman Waterlow at Finsbury are included in the plates, with such plans and details as will enable builders to erect similar habitations. Mr. Hole's volume is, indeed, a text-book upon the subject to which it relates. Few men, able to write so good a book, and having the experience to make it so trustworthy, have the enthusiasm for social improvement by which Mr. Hole is distinguished. In none of the very useful works which has proceeded from his pen, has he appeared to so much advantage as in this volume.

Habitations are to towns what verdure is to a country, with this difference, that the wild luxuriance of Nature is always graceful; the uncultivated architecture of towns is nearly always hideous. Our architects and builders seem to have less originality and less taste than any of our professional men; while their work is the most permanent, and their abortive or thoughtless creations afflict the earth with ugliness for generations, and sometimes for centuries. Of all the uses to which brick and mortar can be put, their talent seems to be in choosing the most unsightly. It would be a disgrace at this day to build a hound-kennel in the style in which poor men's houses are often put up. There is no agricultural show now where more handsome horse-boxes may not be found exhibited than any kitchen of a working man, except where the influence of such men as Mr. Hole, Mr. Godwin, Mr. Roberts, Alderman Waterlow, Mr. Peabody, or the late Prince Consort has prevailed, and of others less known to the public, who, like these, have thought that the taste of the towns and health of the people might be greatly raised.

It is very well known—Mr. Rigby, in a paper drawn for the Society of Arts, points out the fact without giving names—that a large quantity of bad house property in London is in good hands. Miserable sub-let tenements, destructive of health and morals, are owned by very benevolent persons, many of whom have never thought upon the subject. A society which had no other object than finding out the owners of such places, and giving them notice of the fact, would achieve more good than many associations devoted to pet advocacies of new things. Giving information simply is a great thing, provided it be of the right kind, and given in the right spirit to the right parties—three things quite possible to ordinary sagacity and good-will.

The room in which a man lives and dies is important to him. It is important to his family that their home should be marked by taste and comfort. In large towns and growing places, position is everything. However ugly, however inconvenient a house may be, it will be occupied in certain places. It is perfectly gratuitous of owner or builder to think of beauty or convenience. It is a mere matter of conscientiousness; and this quality is not to be expected to be excessive in landlords and builders more than in other classes. Public opinion must step in, and quicken insight and duty in those who have it in their power to perpetuate home frightfulness. Mr. Hole's book is in aid of this public opinion.

If we remember Saltaire accurately, there are some hills before, and a river running through the town; but the fronts of the houses are mostly turned away from the only sight which could charm the working-class occupants. The houses

are good—they attract workmen all around from badly-built towns. Mr. Salt has done a valued thing in putting them up; but his builder might have done better, and so have arranged them as to give a priceless prospect to them, gladdening the hearts of all the occupants for ever, without further cost than thought. That thought not occurring, the town stands fixed for generations. No fortune will rebuild it or undo it. We can bury or break the abortion of the sculptor; we can put away, or sell for signboards, or burn the unhappy canvas of the painter; but the infelicitous idea of the architect is fixed, irremovable—a nuisance for untold time.

We have not seen the position of Akroydon and Copley Village as respects the relation of the houses to the outlook around them; but Mr. Akroyd himself has told us that he sought to put up picturesque habitations at Copley, modified on the old English style, after the manner of old dwellings in the neighbourhood, and in harmony with the beautiful site which lies on the bend of the river Calder. This is taste, and true taste; it is mercy and munificence in its higher and more enduring forms.

Mr. Hole discusses a point of great practical importance—namely, that it does not pay a working man to live in a bad, unhealthy house. He does not gain by it. He thinks he does. This is his mistake. All he saves in rent, and more, goes to the doctor sooner or later, besides the discomfort and suffering of this medical outlay. It is a great thing to do if we could improve popular opinion hereupon. Workmen keep bad houses in the market by taking them. Cheap, bad places are in demand; they ought to be deserted. We know the very poor have little choice; but workmen whose wages really enable them to have some choice do not think of this. We do not put it as a matter of pride, or even taste, but as a matter of economy. Whoever can afford a doctor can afford a well-ventilated, healthy house. Upon all these and many other points we wish to send our readers to Mr. Hole's book. Where it is not brilliant it is sensible and forcible. The author always gives you the impression that he knows well what he is writing about, and of being in earnest. His matter, where it partakes of a business-like character, is constantly clear, and the many plates make even details interesting. Mr. Hole often enlivens his pages by quotations from the poets, but he has no wiser or better lines than these, with which he concludes his work:—

"On the future cast no yearnings, wait not for a brighter day;
We, the builders of the present, make the future what we may."

*The Origin and Uses of Trade Guilds.**

We have traced the rise and progress of the guilds in power and importance up to the time of Henry VIII., and the encouragement afforded to them by the patronage of successive monarchs. Little change took place in their constitution and privileges until the reign of Charles II., when they were induced to relinquish their old charters for others by which the king restricted their prerogatives. But this monarch's proceedings were reversed after the Revolution of 1688, and, nominally, the trading companies were then left to enjoy the same influence as of old.

We have seen, by the powers they had exercised from time to time, according to their charters, that each company claimed absolute jurisdiction and supervision over its own particular trade. This jurisdiction extended to every member of that trade within the city or town in which the guild was established. No person was admitted to practise a handicraft or set up in a business in such a town, before becoming a member of the trade company; and in most cases this could only be effected after serving an apprenticeship.

The regulation of apprenticeships was in the hands of the company, and vigilance was exercised to see that no freeman of the guild employed others than those who were properly apprenticed, or had served their time. Freemen who were ascertained to have infringed the rules in this respect, were either fined or expelled the guild, according to the circumstances. All freemen were also bound to keep the secrets of the trade.

An important power was the right of inquiry and search into the way in which business was carried on, and to fine or imprison unfair traders. A kind of jury was appointed to go the round of the trade at certain times, to discover and report offences. Defective weights and measures were sought out by the officers of the company, as at the present time by Government inspectors. Each company possessed a standard of such measures. Thus the Merchant Tailors kept a silver yard, duly impressed with the company's arms, for the measurement of cloth; and when the great cloth sales occurred at Smithfield, their officers attended to test all persons' measures by this standard. The quality of articles sold was also ascertained; the Vintners, for instance, tasting and gauging wines; the Goldsmiths assaying metals; the Grocers examining drugs, as well as confections, &c. No doubt, in the times when this trade vigilance was carried on, there was far less complaint of the adulteration of food and other necessaries than at the present moment. Increased laxity in this respect is one of the penalties paid by the public for the removal of trade restrictions.

The companies themselves were not without control, for the mayor of the town could fine or imprison their chief members. An instance of this is found in the records of the Brewers' Company. "On the 30th of July, 1422," so runs the entry, "Robert Chichele, the mayor, sent for the masters and twelve of the most worthy of our company to appear at the Guildhall; to whom John Fray, the recorder, objected a breach of government, for which £20 should be forfeited for selling dear ale. After much dispute about the price and quality of malt, wherein Whityngtone, the late mayor" (the celebrated Dick Whittington of nursery story), "declared that the brewers had ridden into the country and forestalled the malt to raise its price, they were convicted in the penalty of £20, which objecting to, the masters were ordered to be kept in prison, in the chamberlain's custody, until they should pay it, or find security for the payment thereof." In this case, it will be observed, the company was held responsible for the misdeeds of members of the trade.

Such were the powers of the guilds, and the checks imposed upon them. Most of these powers were, at one time, of great public service. Had it not been so, they could never have been retained for several hundred years. They obviously tended to foster trade, and secure that it should be properly carried on; but, as time advanced, the requirements of the people and the spirit of the age became different. The system of monopoly, which was one of the leading principles of the guilds, came more and more into disfavour, and the powers of the companies began to decline, through the force of public conviction, long before they were restricted by legislative enactment. The claims of the guilds were felt, in fact, to exercise, in many cases, an injurious influence on the free exercise of industry. They were long the *nurseries* of trade; but it was no more good for trade than for man to be always in the nursery.

The Municipal Corporation Reform Act, 5 and 6 William IV., finally abolished their exclusive privileges. Every lawful occupation was made free to every man, to be engaged in without restraint in any part of the kingdom he might choose. Since then the companies have been held together, in part by the *prestige* attaching to their ancient traditions, but still more by the noble charities and institutions of which they were the foundation. To the honour of the guilds it must be mentioned that, from the earliest times, the principle of mutual assistance in difficulty or distress was as constantly kept in view as trade interest. Almshouses, pensions for decayed members, schools, loans for young beginners, &c., were established, and exist at the present time. Nor was the charity of the companies confined to trade limits; for many of them founded funds for the relief of the poor, the support of hospitals, sermons, university exhibitions, and similar objects. The annual gifts of one company in the City of London to the poor at the present time amount to £3,000; another expends nearly £10,000 a year among its various charities. The trade guilds will never perish nor lose public esteem while such works as these are recorded to their credit.

There are eighty-one trade companies still existing in the kingdom; of these the most ancient and the chief are, of course, those established in the metropolis. The "twelve great companies" of the City guilds bear the title "honourable." The following are their names and order of precedence, settled after long contention:—1, The Mercers; 2, Grocers; 3, Drapers; 4, Fishmongers; 5, Goldsmiths; 6, Skinners; 7, Merchant Tailors; 8, Haberdashers; 9, Salters; 10, Ironmongers; 11, Vintners; 12, Clothworkers.

* Concluded from page 290.

THE SHEFFIELD TRADES UNIONS.

Mr. Henry Farmer, late student of the People's College, Sheffield, in a pamphlet recently published on "The Manufacture of Files," says:—

"The subject of unions is one of such vast importance, and being a topic upon which such diversity of opinion exists, I may be excused if I make a few brief observations.

"In the file trade there are some thousands of hands employed, as forgers, strikers, lighters, smithers, grinders, strippers, cutters, hardeners, scourers, or file dressers, and warehouse hands. All these parties are interested in the prosperity of the trade. The forgers and cutters have a union, also the grinders and hardeners. The two former work by the statement, and it is to the credit of the file trade that outrages upon person or property are seldom if ever perpetrated. This being the case, the usual objections urged against some unions cannot hold good against them. Were all unions conducted on the voluntary principle, and men left to join them on account of their intrinsic good, then unions would become of service, and obtain the universal respect of mankind, because, to help distress when work falls short or death ensues, is praiseworthy; and to regulate prices amicably between employers and employed, as the file trade have done, is to some extent an advantage. Men ought to be able to live by their labour, and manufacturers ought to have remuneration for their capital, time, and responsibility; but when a union is broken up and each manufacturer cuts against the other, competing for reduction in price *instead* of quality, then down goes the article, and the consumer, like Hodge with his razor that would not shave, has to suffer, whilst neither master nor man is benefited. Let the union, then, be one of value, voluntarily conducted, not only disavowing, but, where possible, bringing to justice Acorn Street murderers; then, and not till then, will they have the sympathy of all other classes of the community, for amicable arrangements are best, and strikes have hitherto been most disastrous in their results. Intended to punish the capitalist, they invariably bring misery on the labourer; and 'rattening,' though it may be similar to college tricks, is often more disastrous in its consequences, for the workman, unlike the collegian, has others dependent on his labour."

ENGLISH SALT MINES.

In a recent lecture on this subject the Hon. and Rev. H. P. Cholmondeley said:—"I must inform you that the rock salt itself is by no means the chief object of those who sink the mine. Very little salt comparatively is manufactured from it, as the process of solution is long and tedious, and would scarcely repay the expense. In my brother's mine none of it is manufactured, but all exported for foreigners, and at a very low price. From the published price-list at Liverpool I see that rock-salt has this year reached the increased price of 6s. 6d. per ton. Far more remunerative than the solid rock salt is the brine, which, in the English mines, is always met with, while, strange to say, in the most celebrated salt mine perhaps in the world—that of Cracow, where the length of the excavation is more than six thousand feet, and its depth, in parts, eight hundred feet—not a single spring of brine has been discovered. In the mines of Cheshire the brine spring is almost always struck by the shaft, which first lays bare the outer seam of rock, whence it is pumped into the reservoirs which supply the salt works. Its strength is about twenty-six parts of pure salt to seventy-six of water. When it arrives at the salt works, it is conveyed into large iron pans from twenty to thirty feet long and broad, and ten to fifteen feet deep. Flues pass under them, by which the brine is heated, and then at a boiling heat the evaporation causes the salt to concentrate in crystals at the bottom of the pan, forming the boiled or white salt which is used for culinary purposes. Of this there are several varieties. There is the table salt, the conical blocks of which are seen in every household; this requires but eight hours' boiling, as well as the butter salt, between which and the table salt there is only this difference, that it is not kiln-dried, and not pressed into forms. By far the largest quantity made, though, is common salt, which is in larger grain than table salt, and requires a slower heat in its production, viz., forty-eight hours' cooking and broiling. This salt is used at home chiefly for chemical and curing purposes, and abroad for the purpose of the table. The actual labour of attending to the salt pans, keeping up the fires, drawing and warehousing the salt, is rather hard; and part of it carried on in so hot an atmosphere that the men are obliged to work quite uncovered to the waist. It is, however, a very healthy occupation, and

one at which an active workman may earn excellent wages, averaging from 20s. to 25s. per week, for twelve hours per day hard work. They are mostly a hard-working, inoffensive race, and much attached to their native valley. They used to be much addicted to habits of drinking, but I rejoice to hear that this sad vice is on the decrease, many masters of mines having abolished the pernicious system of allowing public-houses to be kept in the immediate neighbourhood of the works. This used to be a temptation which few, on leaving their work, hot and thirsty, had the strength of mind or religious principle to resist."

Co-operation on the Continent.

FRANCE.

That nations, like men, have their own way of thinking—their idiosyncracy, as the phrase runs—which constitutes their moral and intellectual character, and distinguishes them from their sister nations, is so trite and commonplace a truism that we should beg the reader's pardon for enunciating it, were it not that in practice this fact is constantly lost sight of, and that nations fail to understand one another, simply because they persist in looking at each other's affairs from what we must necessarily call a foreign point of view. Here is an example in point:—

To begin the work of Co-operation by introducing the principle into manufactures is, in the eyes of most English Co-operators, to try the wrong end first; whilst setting up a Co-operative Store, saving money through its agency, and then investing that money in some kind of manufacturing society, seems to them, not only the most, but the only logical process that can be thought of.

There is much to be said in favour of this view of the subject, and, for our part, we do not pretend to gainsay it; but whether wrong or right—it matters little for the present—it is an incontrovertible fact that the French always thought first of Co-operation as applied to manufactures, always began with associations for manufacturing purposes, and—this is a fact, too—have done wonders in that most important branch of Co-operation, whilst in storekeeping they have scarcely achieved any success worth mentioning. We only know of one store that ever attained, in France, to a state of great prosperity: that was "La Fraternelle"—an *association de consommation*, as Co-operative Stores are called in France—which was, soon after the revolution of 1848, established by the frequenters of the Metropolitan Working Men's Hall, "La Fraternité," Rue Martel, Paris; and that association, like many others, was brought to a sudden and untimely end by the political events of December, 1851. As for the "Société Alimentaire de Grenoble," which happily survived that political crisis, and a great number of *associations de cuisiniers*, which unfortunately did not, they were all of them Co-operative Eating-houses, and must therefore come under the heading of associations for labour purposes. Within the last three or four years, several Co-operative Stores have been established in Paris and the provinces, as well as in Spain, Italy, Algeria, &c., and the new name that is given to many of them—*Store Co-opératif*—shows plainly enough that the light under which the revival of this particular form of association took place did not come from the East, but from the North; it was, in fact, the light which some twenty years ago was born in Toad Lane, Rochdale, and which—thanks to the various translations that have been, and are to be, made of Mr. G. J. Holyoake's admirable "History of the Equitable Pioneers"—bids fair never to stop until it has gone round the whole, whole world. That such associations may succeed in France, as they do in England, and to a certain extent in Germany, is one of our fondest hopes; but even if they did not, or did only to a limited extent, it would be no sufficient reason to despair of the future of Co-operation in France; for, though the French unreservedly acknowledge the practicability and usefulness of this form of Co-operation, it is undeniable that they are much less in earnest about Co-operative Stores than about Manufacturing Societies. In this respect, both their words and their actions are wonderfully consistent; and whether we examine into those few associations which, long before any socialist ever thought of suggesting the practicability of Co-operation, sprung, so to speak, from the soil—born, in times out of date, from local wants and opportunities; or whether we look into the far more numerous ones, which later on were resolved upon by men intent on carrying out an idea—we had almost said waging war for an idea—we shall find between their past and present that same consistency which we are now going to trace out between their words and their deeds. And, before we leave this subject of consistency, let us say that, in our opinion, it is far from certain that the accusation of fickleness which was justly enough levelled against the old French aristocracy, can with equal justice be brought against the French nation at large, and most particularly against the French working classes. Let this, at any rate, be an open question: the toiling millions have scarcely had any history yet, and should not be judged by their masters' deeds.

On the question to which we have just been calling the reader's attention—that of the preference of the French for manufacturing societies—the journal *L'Association*, in its very first number (November, 1864), spoke thus:—

"There are three different kinds of Co-operative Societies: the Manufacturing, the Storekeeping, and the Mutual Credit or Loan Societies. These last two forms having lately acquired a considerable development, and the manufacturing societies having made but little progress, some people thought this a sufficient reason to conclude that the future belonged to the last ones, and that the former might, without great inconvenience, be abandoned. It is in Germany, more perhaps than anywhere else, that these ideas have spread, but they have also penetrated into France; and as they seem to us the result of a grievous error, we think it is necessary to oppose them. Our opinion is that the three forms of association are good, that none of them ought to be abandoned, and that the association for the production of wealth should not be neglected for the others, as some people endeavour to persuade us. We even go further: we believe that this kind of association is the most important of all, and that the two others should only be looked upon by the working classes as means, otherwise excellent, to provide for the ulterior establishment of associations for the production of wealth—a kind of association which always shall be the main object of our efforts.

"We are glad to say that in France, where the association for labour purposes originated, and was in some manner invented, the working classes almost instinctively understand this truth. . .

"Every one who chooses to do so, can ascertain the fact, that nowhere in our workshops do those who work for wages receive more than is absolutely necessary to keep soul and body together, and that an incredible amount of courage is needed to bear up against the privations which the least attempt at saving compels them to undergo. Everything tends to make this state of things worse. Thus it is certain that through the introduction of machinery, and the gradual suppression of the small shops, the power of capital increases at a tremendous rate, whilst the labour of the isolated workman loses every day something of its value. It is, then, absolutely necessary that workmen should combine to peacefully resist the colossal forces that are everywhere being organised, and so profit in their turn by the general progress of society. Were it otherwise, there would remain nothing for them but to consider every new invention as an enemy—every social improvement as a personal misfortune.

"Now, Mutual Loan Societies, such at least as those which flourish in Germany, have no influence whatever upon wages. Not so, however, with Co-operative Stores; but mind this: if the working classes absolutely neglected to establish societies for manufacturing purposes, and only cared for stores, there would infallibly happen, that as soon as they would clearly be able to feed and clothe themselves more cheaply, their wages would undergo a proportional reduction, and no other resource would be left to them than coalition and strikes.

"We then maintain that the association for the production of wealth is, properly speaking, the true Co-operative Association. Through it, and through it alone, the working classes will emancipate themselves, hold their ground against the great companies, partake of the profits of industry, cease even to work for wages, and, finally, become their own masters."

Such is the French view of Co-operation—a view which, as a faithful reporter, we were in duty bound to present to our readers. Having done this, we are happy to add, that the French could appeal in favour of the soundness of their view to very high authorities in England. Professor Fawcett, M.P., in his book on "The Economic Position of the British Labourer," says:—

"The first attempts (those of the earlier disciples of communism) which were thus made to Co-operate, were rude and simple; but, although the commencement was imperfect and unpretending, yet a great social and economic movement was commenced. Already great results have been achieved, although Co-operation may be regarded as being yet in the infancy of its development. So much is this the case in our own country, that scarcely any of the societies which are termed Co-operative deserve the title; for, up to the present time, the principle has been almost entirely applied to the distribution, and not to the production of wealth."

This is going further even than the French—too far, in our opinion; for we do not see why an association for a more equitable distribution of wealth should not deserve to be called Co-operative. Yet, we think it good that some among the English Co-operators should be reminded that the most important of co-operative undertakings is the association for the production of wealth, and that, whatever advantages stores may offer, something higher is to be aimed at than a simple partnership in shopkeeping.

*Electrotyping.**

ELECTRO-GILDING AND SILVERING.

Before the precious metals are applied to brass or copper, it is necessary that the articles to be silvered or coppered be carefully cleaned, so as to remove all the oxidised and greasy parts which cover the pure metal, for gold or silver will not adhere to parts in those impure conditions. On the other hand, as the particles of metal are deposited uniformly, and as the new surface copies the old exactly, if the first surface is rough the second is rough also; and if by cleaning we produce a polished surface, the coating deposited upon it will be polished also. This cleaning may be accomplished in various ways, but the object is always the same.

It is very important that the operation of cleaning be well performed, for the success of the succeeding operations is dependent upon it. The process of cleaning varies according to the nature of the metal upon which we operate: *chemical cleaning*, or *scouring*, is applied to copper, bronze, and brass; *mechanical cleaning* is that required by German silver, iron, silver, and the alloys of tin.

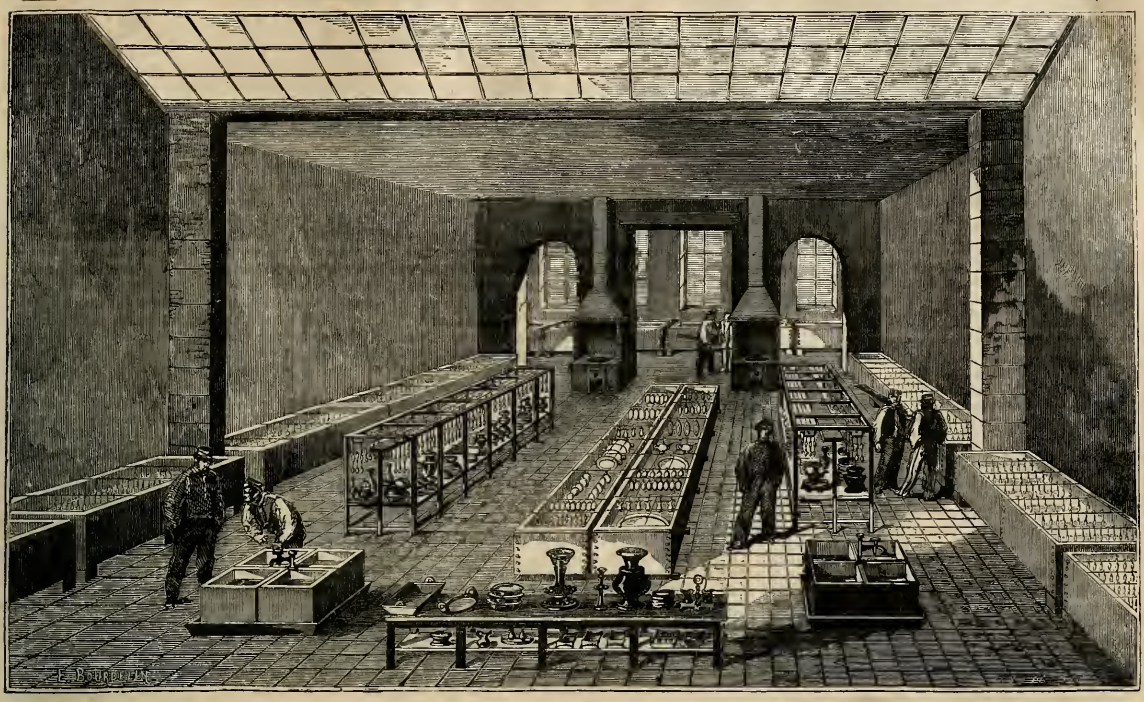
Chemical cleaning consists of a series of very complicated operations. To remove the grease arising from the last stages of fabrication, and especially the condensation of particles imparted to the articles by the chaser, they are heated to a dull red over a charcoal or turf fire. This operation is specially applied to alloys of copper; it causes the gilding to adhere better, and renders the burnishing finer, and puts all the metallic surfaces into the same physical condition. If the articles are of brass, turned, or worked by the hammer, they are put into a strong ley of carbonate of soda, instead of being submitted to the fire.

The exposure of the articles to the fire causes the formation of black oxide of copper, which must be removed to lay bare the pure metal. This is accomplished by immersing the articles in a bath of sulphuric acid diluted with ten times its bulk of water, which is employed warm for small articles, and cold for large ones. The time of operation is not limited; for the bath does not attack the copper, which must remain until the black surface of the articles assumes a reddish colour, which the sulphuric acid does not alter. The articles must not be touched by the hands now, but be suspended by copper hooks with wooden handles. On removal from the acid bath the articles are brushed and washed, and afterwards conveyed to the scouring baths.

The small articles are allowed to remain only a few minutes in the warm acid bath; large articles remain half a day in the cold acid bath. During this immersion the black oxide of copper passes to the state of red oxide uniformly distributed.

Scouring.—The first bath is composed of *aqua-fortis* (nitric acid), which has already been a long

* Continued from page 294.



ELECTRO-PLATING ATELIER OF M. CHRISTOFLE, PARIS.

time employed for the purpose. To restore it to its original condition, it is sufficient to add $\frac{1}{10}$th of its bulk of new acid; it is always ready for use. The object of this bath is to convert the unequal oxidation of the articles into a metallic tint, very uniform after rinsing, and to prevent a too vivid attack in the succeeding bath on those parts where the copper is already laid bare.

The action of the second bath is called *bleaching*. The bath is composed of—nitric acid, 10 parts; sulphuric acid, 10 parts; hydrochloric acid, 1 part. The hydrochloric acid is sometimes replaced by 1 part common salt, and 1 part calcined soot.

This mixture vigorously attacks copper and its alloys. Operations must be conducted very rapidly, and the articles be washed in abundance of water upon removal from the bath. If they are not put at once into the gilding solution, the articles are dried in sawdust.

Mechanical cleaning is performed upon German silver, zinc, iron, and silver. The action of the acids is replaced by *pouncing*, or *pumicing*. This operation is performed by rubbing the articles with a brush of bristles making 600 revolutions a minute, under a stream of water mixed with finely-powdered pumice-stone. Articles which, on account of their delicacy or small bulk, cannot be applied to the wheel-brush, are scoured by hand with appropriate brushes. For silver articles, the pouncing is preceded by the bleaching. They are heated to redness and cooled in a second bath of sulphuric acid at 8°, from which they come out of a beautiful white *mat*; a grey tint shows that the temperature was not high enough. With German silver, iron, and zinc, the pouncing is preceded by a scouring in an alkali, as for brass articles.

For iron, however, a process is employed which is preferable to pumicing. This is a chemical scouring: it consists in immersing the articles, on removal from a potash ley, in a second bath of diluted sulphuric acid, containing 4 per 100 of protochloride of tin. The articles may remain an hour in this bath without experiencing any injury; and polished steel comes out, after the expiration of ten minutes, perfectly cleaned and retaining its brilliancy.

Theory of Gilding and Silvering.—It is important to clearly understand what the agent is that effects electro-silvering and gilding. Whatever be the prussiate employed—whether white cyanide, yellow ferrocyanide (yellow prussiate), or the red ferridcyanide (red prussiate)—the result of the chemical action is always the same, and we always find, and can separate from the liquor, the double cyanide of silver and potassium; and, consequently, it is to that double salt alone that we must attribute the property of silvering. This is what takes place in the three cases of employing the several cyanides:—

1. When we mix cyanide of silver and cyanide of potassium, the double cyanide of silver and potassium is immediately formed.

2. When we boil cyanide of silver in yellow prussiate of potash, the liquor becomes alkaline, and ferrocyanide of silver and cyanide of potassium are formed. By boiling the ferrocyanide of silver it is decomposed into cyanide of silver and cyanide of iron; the cyanide of silver produced combines with the cyanide of potassium, and forms the double salt K Cy, Ag Cy.*

3. If we employ red prussiate of potash, ferridcyanide of silver and cyanide of potassium are formed. The ferridcyanide of silver is afterwards decomposed into sesquicyanide of iron and cyanide of silver, and the double salt, cyanide of silver and potassium, is immediately formed.†

It is, therefore, evident that in all cases it is the double salt of silver and potassium that is formed, and which alone possesses the property of silvering. Extending this theory to all projected solutions, the substitution of one equivalent for another will not change the reactions. The silvering is always conducted on the same principles: we form a double salt of silver with an alkaline base more stable than any of the simple salts of silver, and which, under the action of the galvanic battery, is decomposed into its elements.

Progress of Co-operation in England.—It is stated that Mr. William Lawson, of Brayton, Carlisle, son of Sir Wilfrid Lawson, Bart., and brother of Mr. W. Lawson, late M.P. for Carlisle, has introduced the co-operative system in the management of his estates, mills, nursery gardens, &c., and that he proposes to divide one-tenth of the profits amongst his workpeople.

* This reaction may be represented by the following formula:—2 (Ag Cy) + Fe K^2 Cy^3 = Fe Cy + 2 (K Cy, Ag Cy).

† The following formula will represent this reaction:—3 (Ag Cy) + Fe^2 K^3 Cy^6 = Fe^2 Cy^3 + 3 (K Cy, Ag Cy).

WORKING MEN'S BUILDING SOCIETIES.

Mr. William Hardwicke, the Deputy Coroner for Central Middlesex, says:—"During the last twenty years I have watched with considerable interest the progress of those societies for purchasing land and houses, known generally as building societies. There are at least 2,000 of them, with an invested capital of £8,000,000. These associations are greatly favoured by special Acts of Parliament; they are capable of effecting substantial benefit to the working classes, who may purchase through their medium a house in about fifteen years for the same monthly or quarterly payment that they usually pay for rent in lodgings. These societies offer a good and safe investment, and a large extension of them would tend to counterbalance the cupidity of bad landlords, and lower the rents of inferior houses. Nor ought we to lose sight of the just means which these societies offer for placing the civic and political status of the artisan class on a safe foundation. As owners and occupiers of property, they acquire more frugal and prudent habits, and with increased domestic comfort they are less likely to disturb the peace and prosperity of the country by reckless political agitation, or riotous dissipation. Who can deny that, in accordance with the liberal spirit of the age, a large extension of the franchise is needed? Is it not an anomaly, a reproach to the constitution, that so large a number of the most influential and trustworthy members of the working community should be any longer excluded from a fair share of political influence? The building of houses to the extent they are needed would, in a great measure, remove the ground on which they are at present excluded from the franchise.

"Besides the large increase and better kind of house accommodation which might be effected by building co-operative associations, and philanthropic societies established by private influence, it ought to be known that in the most crowded part of London, and other large towns, a much greater population may exist in a perfectly healthy condition by a better arrangement of cleanly and more open streets, and with loftier houses, or buildings in blocks. The renovation of old houses, too, may be undertaken with advantage. Some notable examples of model buildings in large blocks, capable of accommodating above 100 families, are to be seen in different parts of London.* Mr. G. C. Rigby and Mr. Eyton, who have reported upon model dwellings to the Society of Arts, are of opinion that the plan of buildings with external galleries is, in many respects, the most suitable for the working classes and their families. I wish to mention incidentally two errors that were made in the erection of model lodging-houses by persons with

* Report on the State of Model Dwellings in the Metropolis. By G. C. Rigby, Esq.

benevolent intentions. First, it appears the style of architecture has a tendency to make them too expensive, so that building speculators have an idea that the cost is necessarily so great that they seldom pay more than 4 per cent. on the outlay; the other mistake is that the cottages in the country are of such size and excellence that they are sought after by another class of persons than those for whom they were originally built. These model buildings have every advantage in health and convenience, and the block of buildings is relieved from house duty, each tenement being let at a rent below the rateable amount, and in law is considered a separate house for the purpose of taxation. Floors of these buildings may in some neighbourhoods be advantageously appropriated for shops, a plan which is adopted in Paris, and greatly augments the rent. This, however, is not all that is needed. There must be in all directions suburban dwellings for the industrial population. The most recent attempt to promote this desirable object is that of Mr. Begg, who proposes to form a society (to be called the National Philanthropic Investment Society) for building several suburban villages. By this scheme each village is to contain no fewer than 5,000 cottages, and to be within ten minutes' railway distance of most parts of London. He expects in a short time to remove 350,000 inhabitants from the most crowded districts. A first-class cottage is to contain five rooms, a second-class four rooms, a third-class two good rooms and two smaller ones; each cottage is to accommodate a lodger. Churches, chapels, baths and wash-houses, gymnasia, gas and waterworks, and other public institutions, are to be erected in connection with these villages. Such a scheme, and others which, perhaps, will be devised, can be made feasible only by the assistance of railway companies. Directors are not unwilling to aid. Some have already started working men's trains—trains by which his family are benefited equally with himself—and manifest a disposition to furnish the workman with the same advantage as his richer neighbour, who for years past has had the benefit of living at a distance from the scene of his daily work. It is apparent, too, that cheap locomotion will have the effect of removing many large factories into more open spaces, and thus improve the health of the operatives, and at the same time free crowded neighbourhoods of a redundant population."

How came our Club to Fail?

BY THE REV. H. SOLLY.*

The reason why is generally very plain; plain enough in those cases which I have already detailed at full length, also in most of those which I notice as having failed, in glancing down the list, and in referring to letters or conversations on the subject. It is, however, unnecessary to look further into such cases at any length, because the universal mistake of admitting youths, without due regulations, we now see to be quite enough to have caused failure. Other adverse circumstances, no doubt, have generally helped, but the admission of youths, for the most part, had previously so weakened each Club—so completely repelled adults from attending it in sufficient numbers, that it had not strength enough to resist, or to recover from, other minor evils.

Take, for instance, the Club and Institute at the pleasant little town of A——. Here were most of the elements of success on a small scale, especially an active, zealous, and genial honorary secretary; but in about a year's time he wrote to me thus: "We found, to our cost, as others have done before, that boys and men will not work together. The boys monopolised the place, and, at last, became so unmanageable, that we had to close the Club, and, at present, do not see our way clear to re-open it."

In many of the cases of failure the causes assigned seem so utterly inadequate that we are naturally led to ask if there were not some other deeper mischief at work. Thus another honorary secretary wrote, some time since: "I am sorry to have to state that the Working Men's Club and Institute at W—— has been discontinued. We had notice to quit the premises, a brewer having contracted for them on a lease, at an advance of £8 on the rent we paid, and no other eligible premises offered. Our rooms were, unfortunately, not in a sufficiently central situation, though the best that offered; and a low 'Alhambra Palace,' opened in the same street, was sadly against us."

Yet a member of the council of our Union, who has some influential acquaintances in the neighbourhood, said to me, "Why, if we had known here [at our office] that they were being turned out of their house for £8 a year, I could have got them that sum in the neighbourhood two or three times over, or enough to help them to get other premises;" but, unhappily, they chose to die out in silence, without even letting us know in what straits they were placed. I visited that club once, and it happened to be the evening for their weekly entertainment. The largest room in the house was crowded; a lady was playing the piano; half-a-dozen members were giving some capital songs; others gave recitations; and everybody seemed to thoroughly enjoy the evening. That the club was well adapted, also, to meet the every-day wants of the humblest labourer was shown by the following fact, mentioned to me by the secretary on the occasion of the visit in question. Some time after the Club and Working Men's Institute had been opened, as the secretary was walking down one of the principal streets, a paviour stopped his work to say "Good morning" to him; then taking a purse out of his pocket, and shaking it before the face of the admiring secretary, he added: "It's all siller, master—all siller! —and I owe every penny of it to your place up yon. I haven't spent sixpence in the public-house sin' I joined it three months agone, 'cept Christmas-day, when a week's wages went all at once; but I shouldn't have gone there then, you see, if t'other place had been open."

We mention this incident just as it occurred, because it illustrates the "saving power" of these clubs and institutes, not as necessarily proving that they ought to be open on Christmas-day.

Here, however, is a case in which our much-abused, but deserving young friends, "the boys," were clearly quite guiltless of any share in the catastrophe. At the Club in another town (also beginning with W——) weekly dances and beer were gradually introduced. Disreputable characters naturally followed, and the Club, which at one time was doing a great deal of good among genuine working men, was broken up. The same remarks are suggested in this case as in regard to the dramatic entertainments that ruined the Club at B——, viz., that whether dancing be a desirable mode of relaxation, is not the question, but whether a Working Men's Club and Institute ought to be turned into a dancing club. A dance, "once and away," in a family, in an Odd Fellows' or Foresters' lodge, in a Working Men's Club and Institute, &c., may be a very pleasant and innocent thing if properly conducted; but clearly genuine working men don't want to be always dancing, nor do they want other people to be having a weekly "hop" on their premises. Such proceeding could only be carried on by persons who were serving their own ends, not aiming at the legitimate objects of a Working Men's Club and Institute.

Here is a case of break-down at H——. It would be difficult to attribute its failure to any particular want of good management or zeal; but it illustrates all the more strongly the need of good premises. The Club-house in this place had merely a few small rooms—no hall or large room for a weekly "free and easy," or other entertainment, not even a good-sized room for social chat and smoke. Now, this latter is almost essential to the success of a Club. Men are gregarious, and like large numbers just in proportion as they merely want society by way of relaxation. Working men who require this will not go and sit down in a small room where there are only two or three besides themselves. A hard-worked, tired man will sometimes peep into three or four public-houses (if he is not a regular frequenter of one in particular), and not stop at any of them until he sees one already well filled. That Club at H——, I believe, died of small rooms chiefly.

This verdict might be passed on several other Clubs besides. It would apply to B—— G——, for instance, and to two Clubs in H—— (London), but in all three cases that evil was combined with want of sufficient co-operation and genial management to make the Clubs attractive to working men, and to give them that "welcome" of which I spoke in a former paper. But enough of this dismal work for the present. Let us turn again, for a short time, to our friend's

RAMBLES AMONG WORKING MEN'S CLUBS AND INSTITUTES.

"In B——, whither I went from C——, three attempts have been made to establish Working Men's Clubs. The working men of that city, however, have, so far, evinced the most complete incapacity to manage such institutions themselves. In each of the three instances they had the advantage of most liberal help from wealthy members of other classes; but their mismanagement was such that in one case—that of the St. P—— Working Men's Club—the institution perished after a very brief existence, leaving one of the gentlemen who had taken an interest in it a loser by it to the amount of more than £100; and in the other two cases—that of the C—— P—— Working Men's Club and Institute and that of the St. J—— Workmen's Hall—the control of the affairs of the institutions has had to be entirely withdrawn from the management of the members of them.

"The C—— P—— Working Men's Club and Institute was opened in December, 1863. It occupies extensive and commodious premises, comprising a large reading-room, a smoking and conversation-room, two large class-rooms, a room devoted to committee and other meetings, a very large lecture-hall, a bagatelle-room, a bowling saloon, and a refreshment-room and kitchen. At first, it paid a rent of £80 for these premises, but the rent has since been reduced to £60. The Club commenced very prosperously indeed—the balance-sheet for the first six months, December 21st, 1863, to June 25th, 1864, showing that its receipts during that half-year amounted to no less than £431 2s. 5d. Of this sum, £140 10s. 8d. was derived from members' subscriptions, and the fees for admission of non-members to the entertainments given in connection with the Club; the remaining £289 11s. 9d. consisting of donations. The expenditure during the first six months, including the expense of furnishing the club-house, was only £325 10s. 2d., so that the Club began its second half-year with £105 12s. 3d. in hand. Notwithstanding, however, that it began its second half-year with this handsome balance, and that its income during that period amounted to nearly £120 (due exclusively to members' subscriptions and the proceeds of concerts, &c.), at the end of the half-year the Club was in debt £28 6s. 6d. At the end of the first quarter of 1865 the debt was increased to over £56, and it had become most plainly apparent that the committee of the Club had no capacity whatever for managing business affairs. The result was, that Mr. —— ——, in order to keep the Club open, generously offered to pay its debts, and to take upon his own shoulders (for, at least, the remainder of the year) the entire responsibility of carrying it on. This was the footing upon which things were at the time of my visit, in July: Mr. —— —— paying all the expenses of the Club, and receiving all its receipts. Mr. —— was just then much occupied with election affairs, and was undecided, I believe, as to what he would ultimately do in the matter.

"But for bad financial management, the C—— P—— Club would have been eminently successful. It has never been short of members, and might readily have been made quite self-supporting. Its abundantly-supplied reading-room, its commodious bowling-saloon, and its comfortable conversation, smoking, and games' rooms—in all of which, except the reading-room, the members can be served with wholesome refreshments, at very cheap rates —have all proved very attractive; and so have its entertainments and classes. Throughout 1864 at least two entertainments were given per week, summer and winter, and for six or seven weeks in the winter season three entertainments were given per week. The entertainments have consisted of recitations, songs, &c., the reciters and singers all giving their services gratuitously. The members have been admitted to the entertainments free, and non-members on payment of one penny each. The hall in which the entertainments are given is of considerable size, but in the winter season it has frequently happened that from fifty to 100 more persons have presented themselves for admission than could possibly be got into it. The number of non-members paying for admission has usually been between 100 and 150. The classes in operation at the time of my visit were (1) a Tonic Sol-fa Singing Class, averaging an attendance of from forty to eighty persons; (2) an Elocution Class, with an average attendance of from ten to twenty-five persons; (3) a French Class, attended by an average of about six persons; and (4) a Mechanical Drawing Class, attended by about a dozen persons. The classes all met once a week; the teachers of them were all members of the Club, and all *gave* their services; and members of the club were admitted to them all free. At the time of my visit, the arrangements with respect to members' subscriptions were different from what they had been until a few weeks previously.

* Continued from page 299.

The rates of subscriptions were originally, for ordinary members, 2s. 6d. per quarter, 4s. per half-year, or 7s. 6d. per annum, or, for females, 1s. 6d., 2s. 6d., and 5s. respectively, and until the end of the first quarter of this year the greater number of the members had paid their subscriptions quarterly. At the commencement of the second quarter of this year, however, the affairs of the club were in such an unsettled state that it was deemed advisable not to issue, for a time, at least, any more tickets extending over a period of more than one week, and at the time of my visit the club had accordingly no holders of either quarterly, half-yearly, or yearly tickets, and admission was to be had only by weekly tickets, price threepence each, or else by payment of one penny per visit. The weekly tickets admitted to all parts of the club, including the bagatelle-room, and to the full privileges of membership, including the right to attend the classes and entertainments; but the payment of one penny only admitted into the building once, and then only to the reading-room, bowling saloon, and dominoes and draughts room. There were about sixty holders of weekly tickets, and the average number of admissions on payment of a penny per time was about two hundred per week. The proceeds of the entertainments, which were still—in July—being given once a week, probably raised the total income of the club to about £2 per week. As the expenses of the club are about £250 a year—rent, £60; manager's salary, £50; coal and gas, £50; pianiste, £26; newspapers, £13; printing, £20; sundries, £10; total, £253—it was thus, at the time of my visit, far from paying its way. This, however, was at the very worst part of the year, and the previous experience of the club left little room for doubt that ordinarily prudent management was all that was needed to make the club quite self-supporting, taking one season with another."

HOW WATT MADE HIS GREAT DISCOVERY.

In order to follow the track of investigation pursued by Watt, it is necessary for a moment to revert to the action of the Newcomen pumping engine. A beam, moving upon a centre, had affixed to one end of it a chain attached to the piston of the pump, and at the other a chain attached to a piston that fitted into the steam cylinder. It was by driving this latter piston up and down the cylinder that the pump was worked. To communicate the necessary movement to the piston, the steam generated in a boiler was admitted to the bottom of the cylinder, forcing out the air through a valve, when its pressure on the under side of the piston counterbalanced the pressure of the atmosphere on its upper side. The piston, thus placed between two equal forces, was drawn up to the top of the cylinder by the greater weight of the pump-gear at the opposite extremity of the beam. The steam, so far, only discharged the office which was performed by the air it displaced; but, if the air had been allowed to remain, the piston once at the top of the cylinder could not have returned, being pressed as much by the atmosphere underneath as by the atmosphere above it. The steam, on the contrary, which was admitted by the exclusion of the air, could be condensed, and a vacuum created, by injecting cold water through the bottom of the cylinder. The piston being now unsupported, was forced down by the pressure of the atmosphere on its upper surface. When the piston reached the bottom, the steam was again let in, and the process was repeated. Such was the engine in ordinary use for pumping water at the time that Watt begun his investigations. Among his other experiments, he constructed a boiler, which showed by inspection the quantity of water evaporated in any given time, and the quantity of steam used in every stroke of the engine. He was astonished to discover that a small quantity of water, in the form of steam, heated a large quantity of cold water injected into the cylinder for the purpose of cooling it; and upon further examination he ascertained that steam heated six times its weight of cold water to 212°, which was the temperature of the steam itself. "Being struck with this remarkable fact," says Watt, "and not understanding the reason of it, I mentioned it to my friend Dr. Black, who then explained to me his doctrine of latent heat, which he had taught for some time before this period (the summer of 1764); but having myself been occupied by the pursuits of business, if I had heard of it I had not attended to it, when I thus stumbled upon one of the material facts by which that beautiful theory is supported." When Watt found that water, in its conversion into vapour, became such a reservoir of heat, he was more than ever bent on economising it; for the great waste of heat, involving so heavy a consumption of fuel, was felt to be the principal obstacle to the extended employment of steam as a motive power. He accordingly endeavoured, with the same quantity of fuel, at once to increase the production of steam, and to diminish its waste. He increased the heating surface of the boiler, by making flues through it; he even made his boiler of wood, as being a worse conductor of heat than the brickwork which surrounds common furnaces; and he cased the cylinders and all the conducting pipes in materials which conducted heat very slowly. But none of these contrivances were effectual; for it turned out that the chief expenditure of steam, and consequently of fuel, in the Newcomen engine, was occasioned by the reheating of the cylinder after the steam had been condensed, and the cylinder was consequently cooled by the injection into it of the cold water. Nearly four-fifths of the whole steam employed was condensed on its first admission, before the surplus could act upon the piston. Watt therefore came to the conclusion, that to make a perfect steam-engine, it was necessary that the cylinder should be always as hot as the steam that entered it; but it was equally necessary that the steam should be condensed when the piston descended,—nay, that it should be cooled down below 100°, or a considerable amount of vapour would be given off, which would resist the descent of the piston, and diminish the power of the engine. Thus the cylinder was never to be at a less temperature than 212°, and yet at each descent of the piston it was to be less than 100°; conditions which, on the very face of them, seem to be wholly incompatible.—*Smiles's Lives of Boulton and Watt.*

John Critchley Prince.

Within the last few days another of our workmen-poets has disappeared from the workshop of life. John Critchley Prince, one of the sweetest and purest-toned of the Lancashire bards, died on Saturday, the 5th inst., at Hyde, near Manchester. In his "Peerage of Poverty," the Rev. E. Paxton Hood thus mentions Prince:—

"Without claiming for him, by any means, the foremost place in the ranks of those who have united together literature and labour, it may yet be said of him that he possesses that moral insight which is the foundation of genius—the pictorial eye and utterance in a pre-eminent degree. He has also been educated by suffering, by labour, and wonderfully by communion and fellowship with Nature. He is a reed-maker for weavers, to which trade he was put at the age of nine years, and compelled to continue at it for fourteen or sixteen hours a day. Every indication of a love of books was sought to be repressed by his father.

"There is no doubt that these adverse circumstances may have depressed the full development of his poetic genius, but *that* strong principle of his nature, poverty, want, and punishment were unable to exterminate. A mind skilled in tracing moral effects to their causes might be able to prove that the strong love of freedom, which so nobly characterises the poet's compositions, was in a large measure developed by the harsh treatment to which, in his early youth, he was subjected; and that the ardent love of Nature which breathes through his strains was heightened by contrasting the gay and joyous life of the inhabitants of woods and wilds, and the beauty and harmony of trees, streams, and flowers, with the unrelieved and still-recurring toil of his own occupation, carried on in the poverty-stricken chamber—

"Where the pale artist plies the sickly trade.'

All the adverse circumstances that surrounded him were unable to 'freeze up the genial current of his soul;' the passion was intense, and *would* be gratified. When the family had retired to rest, often would young Prince, at the 'witching hour of night,' leave his bed, and, with furtive steps and slow, creep down-stairs, and, by the dim light of the 'slacked' fire, revel in the charms of 'Robinson Crusoe,' or the horrible and mysterious grandeur of Ann Radcliffe and Monk Lewis. The native longings of his heart found a rich banquet in the wild and wondrous of these tales; and the beautiful description of natural scenery which gives such a charm to 'The Mysteries of Udolpho,' and the free scope for inventive genius in the solitariness of Defoe's shipwrecked mariner, fed the enthusiasm of the embryo bard, and made him sigh to visit foreign lands, and meet with 'moving accidents by flood and field.'

"We can very well conceive that sentiments like those embodied in the following magnificent stanzas would be felt at this period of his life, if not thus expressed:—

"Did God set his fountains of light in the skies,
That man should look up with the tears in his eyes?
Did God make his earth so abundant and fair,
That man should look down with a groan of despair?
Did God fill this earth with harmonious life,
That man should go forth with destruction and strife?
Did God scatter freedom o'er mountain and wave,
That man should exist as a tyrant and slave?
Away with so heartless, so hopeless a creed,—
The soul that believes it is darkened indeed!'

A hard matter, one would suppose it to be, to hold fast faith in God and man, in a life chequered as Prince's was by the most sad suffering and misfortune. His whole early life was passed in poverty; and when labour entirely failed in England, he travelled over the Continent in search of employment. He reached Paris just about the revolution of 1830. He travelled on foot through Champagne, Mulhausen, and St. Quentin, but all his efforts to obtain work were fruitless; so with ten sous in his pocket, in the middle of the winter, he set off with the intention of walking the whole of the way home to Hyde, Lancashire; and journeying by the banks of the Rhine, through Strasbourg, Nancy, Verdun, Luneville, Rheims, and Chalons, he reached Calais, procured a passage from the British Consul, and once more set foot in England.

"During this toilsome journey he subsisted on the charity of the few English residents whom he found on his way. He lay in four different hospitals for the night, but not once in the open air, as he did afterwards in his own country. The first night after his arrival he applied for food and shelter at a workhouse in Kent, and was thrust into a miserable garret, with the roof sloping to the floor, where he was incarcerated along with twelve others—eight men and four women, chiefly Irish—the lame, the halt, and the blind. Some were in a high state of fever, and were raving for drink, which was denied to them; for the door was locked, and those outside, like the bare walls within, were deaf to their cries. Weary and way-worn, he lay down on the only vacant place amid this mass of misery, at the back of an old woman who appeared to be in a dying state; but he could get no rest for the groans of the wretched around him. Joyfully did he indeed hail the first beam of morning that broke through the crannies of this chamber of famine and disease; and when the keeper came to let him out, his bed-fellow was dead!

"Released from this lazar-house, he proceeded onward, penniless and shoeless, towards London, begging in the day-time and lying in the open fields at night. When he reached London he had been the whole day without food. To allay the dreadful—but to him the familiar—cravings of hunger, he went to Rag Fair, and, taking off his waistcoat, sold it for eightpence. He then bought a penny loaf to mitigate his hunger, and four pennyworth of writing-paper, with which he entered a tavern, and, calling for a pint of porter, proceeded to the writing of as much of his own poetry as his paper would contain, and this amid the riot and noise of a number of coalheavers and others.

"As soon as he had done his task, he went round to a number of booksellers, hoping to sell his manuscript for a shilling or two, but the hope was vain. The appearance and manners of the famishing bard, to these mercantile men, were against him—he could not succeed in finding a customer for his poetry, or sympathy for his sufferings.

"He stayed in London during two days, wandering by day, foodless, through its magnificent and wealth-fraught streets, and pacing about, or lying on the cold stones in gateways, or on the bare steps of the affluent, by night.

"Meantime, his family also, in his absence, had suffered almost as much as himself; he returned to privations still more bitter than those he had known in the course of his journey. At last, through the kindness of J. P. Westhead, Esq., M.P., he was drawn forth from his obscurity, and a volume of poems published, which called forth extraordinary laudations from the various critical journals. His writings, to his honour, abound in most cheerful views of life; there is nothing misanthropic in his lyrics. He has passed through the deepest waters and fires of suffering without losing his heart or hope; and his verses overflow with glowing aspirations for human progress, and moral and intellectual advancement."

At the time of his death, John Critchley Prince had attained his sixtieth year.

MONEY PRIZES,

TO BE COMPETED FOR BY

WORKING MEN.

TWENTY PRIZES—TEN of FIVE POUNDS each, and TEN of THREE POUNDS each—are offered by Messrs. Cassell, Petter, and Galpin. One Prize of Five Pounds for the Best Essay, and One Prize of Three Pounds for the Second Best Essay will be given. The list of subjects and the conditions of competition appeared in Nos. 10 and 11 of the Working Man.

We have much pleasure in announcing that the following gentlemen have kindly undertaken the adjudication of the Prizes:—The Right Hon. Lord Houghton; Right Hon. Lord Lyttelton; Right Hon. Lord Talbot de Malahide; Lord Milton, M.P.; Charles Buxton, Esq., M.P.; John Stuart Mill, Esq., M.P.; Rev. Charles Kingsley, M.A.; Rev. F. D. Maurice, M.A.; and the Rev. J. Begg, D.D.

"ALL LABOUR IS SACRED."—*Carlyle.*

What to do with the Proposed Victoria Park Gas-Works.

There never was a vice but it found some defenders; even Burke ventured the opinion that vice itself was improved and almost made presentable when divested of grossness and made graceful. There never was a nuisance but it had champions. Some time ago, and not a long time either, we had a metropolitan M.P. who took up the cause of cesspools. When Paternoster Row, a few years since, bore a strong scent of tallow—so much so that a gentleman who bought a book there took home an undesirable flavour of "long eights" in his pockets—worthy cits volunteered evidence that a smell of tallow was wholesome, and ought to be cherished. Now the Hon. Mr. Cowper comes forward almost in praise of gas fumes. He told the House of Commons the other night, in effect, that he did not think the proposed gas-works at Victoria Park would prove so very bad. They could be so conducted as not to be a nuisance, or if a nuisance, not a serious one.

We think Mr. Cowper's view of the case may be subjected to a very practical test. Gas companies in question might adjourn their operations from Victoria to Hyde Park. We should soon hear then what opinion is formed of their salubrity. There is a nice vacant space near the Brompton Boilers, which nobody seems able to fill up satisfactorily; there is the vast area where the International Exhibition stood. It is still unappropriated; in fact, there is a constant dispute going on as to what shall be done with the space. Some want it for horticultural and some for art purposes. If Parliament can be persuaded to furnish the money, it is intended to convert the spot into a vast temple-ground of art and science. At present, however, the public are not agreed as to what they want, nor has Mr. Gladstone agreed to furnish the money; but we have no doubt, if Mr. Cowper should go down to the House of Commons with a grand project for uniting all the gas companies there, the scheme—if his own account of the operations of the gas manufacture may be trusted—would be highly popular. They want something grandly novel in that neighbourhood, and having, at the same time, a dash of the scientific in it. It therefore strikes us that these gas companies, according to Mr. Cowper's account, are exactly the thing wanted. To consume 2,000 tons of coal per day, without making any smoke worth mentioning, is certainly a feat in chemical art which has never yet been realised, and it would be of the highest practical advantage to the country to have it proved that the thing could be done. Mr. Cowper thinks that clauses could be inserted in the Gas Companies' Bill which would oblige them to consume, make away with, or remove certain deleterious ingredients used in gas manufacture; but who are to see these rules carried out, and be the guardians of the health of the residents around? In the neighbourhood of Victoria Park and Hackney Wick, this duty—which will require considerable chemical knowledge and vigilance to apply—is sure to be imperfectly performed. It will require an association to enforce the companies' rules over many acres of operations. Now, this is precisely the duty which some of the societies already established in South Kensington could undertake, and raise gas-making into the rank of a fine art, as well as convert it into a salubrious profession. If Mr. Cowper's view of the matter is correct, there is no doubt this can be done; and we are sure that none of the operations or services rendered by any of the very useful societies and training schools in that neighbourhood, can be compared with the advantages to society, and, indeed, to human life, which they would thus render.

The public of London owe much to Mr. Cowper for the admirable improvements which he has made in the parks under his care. He has given us parterres in Regent's Park, and made bare fields bloom like an Eastern garden; he has even supplied chairs for the weary and admiring public to sit down upon, where they may truly "rest and be thankful." The working-class public owe much to Mr. Cowper. His courtesy and taste we do full justice to; but he might take in hand this Chartered nuisance at Victoria Park, which would be harmless, on his theory, at Kensington.

The effluvia caused by ammoniacal liquor and other refuse of gas-works, he admitted, is not savoury; yet he felt—these were his words—"that no just ground could be shown for apprehending that any inconvenience would be felt by the frequenters of Victoria Park from the existence of gas-works in the neighbourhood, properly superintended and conducted." Then there will be none felt at Kensington, for they can be "properly superintended and conducted" there. We believe it will be shown that gas-works are beneficial in cases of consumption; they will, therefore, be a valuable addition to the Brompton neighbourhood, where there is an hospital for the cure of consumption. Mr. Cowper has already the "Brompton Boilers" there, and gas-works would only seem an appropriate accompaniment. It has not occurred to Mr. Cowper what a popular solution of the Victoria Park gas question this would be. It would put an end to all agitation, delay, or compromise. We beg to present the idea to our popular Commissioner of Public Works.

The promoters of the Gas Bills before Parliament have published their reasons in support of their claims, and they tread closely on the heels of the official logic of Mr. Cowper. That honourable gentleman reminded the House of Commons that "there were already artificial manure works and others of a most disagreeable and prejudicial character in the vicinity of the Park." This alone ought to be a reason why Parliament should take care that there are no more introduced, not a reason why the House should be reconciled to further nuisances. But official logic has laws of its own. The promoters of the Gas Bills follow the same course of reasoning. They say that if they do not establish their works there, private companies may occupy the spot and do worse than they contemplate doing. This is, no doubt, true. There never was an evil which might not be succeeded by a worse. But the common-sense question is, Will or will not Parliament interfere to protect a park of the poor, in a populous neighbourhood, from practical destruction? We think the people have a casé for consideration, and so Parliament decided when it emphatically threw out the bill of the Imperial Gas Company.

But the Chartered Gas Company have yet to be dealt with, and this being the case, Mr. Cowper cannot do better than act upon our suggestion. On the day of the present writing we have taken an opportunity of inspecting our proposed site at Brompton for the Victoria Park Gas-Works; and looking at that hideous erection, the "Brompton Boilers," which our Fine Art Commissioners cherish, we are of opinion that a gas-works would be a "thing of beauty and a joy for ever" by their side; and therefore, on æsthetic as well as on sanitary grounds, we have hope that Mr. Cowper will listen to our proposal; and if he does we shall be inclined to suggest that a monument be put up in honour of Mr. Cowper on the spot now selected as the site of the gas-works adjoining Victoria Park. The whole population of Hackney Wick and Bow will hail this graceful and grateful erection as a happy and honoured substitute for the repugnant, repellent, deleterious, and abhorred gas-works.

Since we had written so far, the House of Commons has thrown out one of the Gas Bills which threatened Victoria Park; and Mr. Cowper very mercifully contributed to the result; Mr. Beresford Hope rendering important assistance. However, the gas-works must go somewhere, and they may, perhaps, be thankful for our suggestion of the Kensington site.

The Logic of Mr. Lowe.

When Mr. A. Peel made his maiden speech in the House of Commons, a few weeks since, he spoke of "that Goliath of logic, Mr. Lowe." That Mr. Lowe is a man of brilliant parts, and can see farther into a millstone than most men, is true. But it is also true that he takes up positions which startle the common sense of ordinary men, and makes great orations and threatens the destruction of English institutions, without an atom of cause or sufficient reason assigned.

For instance, in his great speech against Mr. Baines's Reform Bill, he showed, first, that Mr. Baines's arguments would cover universal suffrage, and forthwith grew eloquent on the dangers of that, forgetful that Mr. Baines's Bill would only effect a very narrow extension of the suffrage. Next he showed that nobody really cared for electoral power. If so, there could be, as every one sees, no danger in granting it. Again, he told of Australian experience, which proved that when universal suffrage was enacted there, a shilling fine was inflicted on all electors, as a registration fee, which had the effect of disfranchising

half the Australian nation. This argument proved that if we had universal suffrage enacted one day in England, a fine of eighteen pence per elector would save the nation. Instead of our institutions being destroyed, we should have only to consent to enrich our exchequer, and all danger would be averted. But these screaming fallacies are emitted in retorts so glittering and in language so racy, that it is impossible not to enioy them while you despise them. Mr. Lowe's arguments are like that poetical logic which frequent quotation has made familiar to all. In the lines, to wit,

> "My wound is great because it is so small;
> Then 'twould be greater were it none at all,"

the second line is given as a brilliant refutation of the first. It is very sparkling, but it is no reply. A small wound may be as great an outrage as a large one; just as stealing a penny is as much robbery as stealing a thousand pounds. The argument is, that if there be a wound wrongly given it is great; even its smallness may be an aggravation, as combining full malice with the intended evasion of consequences because of its apparent minuteness. If something wrong be done, the wrong may be great in principle though minute in fact. But the first line supposes that some wrong is really done. The reply assumes that nothing whatever is done, and then that the infinite consequences equally follow. When some one said—

> "He who rules our freemen must himself be free,"

or words to that effect, Dr. Johnson replied, in ridicule and refutation—

> "He who drives fat oxen must himself be fat."

Now, there is a moral connection between moral qualities in a ruler and the same qualities in the ruled. There is a relation between the political liberty of the governor and that of the governed; but there is no physical relation between the obesity of the driver and the oxen whom he goads along. So that the epigrammatic answer of Dr. Johnson amuses but does not confuse us. Mr. Lowe used precisely the same argument in the late Reform debate, in reply to Mr. Milner Gibson.

Mr. Lowe remarked—"My honourable friend says, there is a constituency which has become corrupt; let us turn on the pure water of a £7 franchise. That doctrine might be sound if my right honourable friend could establish the doctrine that health is catching, like disease. If I have half-a-dozen cattle ill of the cattle plague, and I turn in amongst them a hundred other cattle who are healthy, I infect the new ones, and do not much good to the old ones." Now health, being a state of individual soundness, is not communicable like the particles of decay where disease is present. The things compared are different; but in morals there are common relations between the principles and conduct of men. Everybody knows that good company is an influence as well as bad company; that moral circumstances have effects. "Evil communications corrupt good manners," is an aphorism thousands of years old; and the converse is true, that good communications will refine and reform bad manners. To answer one position by another that looks exactly like it, but is radically different, is ingenuity often amounting to wit, but is not logic, which requires an adherence to relevant facts. Again, when Mr. Lowe adverted to Mr. Gladstone's speeches which recognised the right of humanity to representation, saying, if any portion of the people are proposed for admission to the suffrage, it rests upon those who object to their admission to show their unfitness, he (Mr. Lowe) represented that this was an argument in favour of universal suffrage, which it was not. It carefully guarded against it. But if it were an argument in favour of universal suffrage, it need not fill Mr. Lowe with the "gloomiest forebodings," as he alleged, because the Bill before the Parliament was not a measure of universal suffrage, but merely the creation of a new electoral guild—a worshipful company of

VENETIAN LAVABO, SEVENTEENTH CENTURY.

seven-pounders. This practice of taking enormous premises, and maintaining that all the evils which might flow from them will occur when a ridiculously minor measure is put in operation, is absurd; and this application of evils, which might exist if something not intended is done, to a measure which cannot produce them, is known in the House of Commons as "Lowe logic."

The man who returned a borrowed kettle with a hole in it, and argued that he did not create the aperture, for the hole was already there; and secondly, there was no hole at all; and thirdly, that he never borrowed the kettle in the first instance, is only an illustration of a good deal of Parliamentary logic which a brilliant audacity offers and a prejudiced party accepts. We do not here concern ourselves which side is right in the contest on Reform; we only address ourselves to what Lord Grosvenor and Lord Stanley call a "method of procedure." Never were fallacies more glaring advanced with so much vivacity as Mr. Lowe threw into them. Working men in Parliament might not be so brilliant—it is not possible that they could be more unsound.

The Artist Workman.

VENETIAN LAVABO OF THE SEVENTEENTH CENTURY.

The little earthenware and copper fountains which we meet with in such large numbers in curiosity shops are the last vestiges of a kind of furniture, very common during the Middle Ages, which continued in general use up to the beginning of the last century.

In the refectories of monastic establishments, in the dining-halls of castles, palaces, and inns, *lavaboes*, sometimes of large dimensions, were fixed in the building, and constructed of lead, stone, marble, or bronze. Sometimes they were movable, and placed in niches in the wall, sustained by a console, or resting on an iron foot. The large *lavaboes*, consisting of a capacious basin or cistern, furnished with taps and spouts, were adapted for abbeys, where a number of persons washed at the same time before and after meals. In castles and mansions a basin and ewer sufficed for ordinary purposes: they were presented to the master of the house and his guests when they seated themselves at table and when they rose from it. The niches which still exist in the halls of ancient chateaux testify that *lavaboes* were sometimes pieces of furniture of very considerable dimensions, to which a particular place was assigned.

To understand how much this kind of furniture was indispensable, it must be remembered that, until a very recent period, forks were not seen even upon the most sumptuous tables, and that, also, for a long time it was the practice for two persons to eat off the same platter, and many from the same dish. In the Middle Ages, as in the East at the present day, more regard was paid to splendour than to cleanliness. For the same reason, spoons were supplied to the guests to convey liquid messes on to their plates, but in small numbers—one for each person during the whole dinner—but no forks. They ate meat, fish, and all solid food with their fingers, and delicate-minded persons gave rules for using them properly. During the thirteenth century they had forks for some particular dishes, but not as a general rule. This state of things prevailed at the tables of royalty. Among the wealthy classes there was nothing of the kind. It was not until the seventeenth century that forks came into general use.

To this period belongs the Venetian *lavabo* of our engraving. The basin, ewer, and the little shell-shaped dish beneath it are of copper; the stand is of hammered iron; so is the stem, crowned by *fleur-de-lis* ornaments, which form a double cross. The ornaments placed at the extremity of the branches around the ewer are coloured and gilt. The horizontal iron stem projecting above on the right served to hold the towel. The weather-cock, which represents a cavalier in the costume of the period, appears to be a sign, probably, of the inn for which the *lavabo* was constructed.

Strength of Iron Girders.—Mr. Fairbairn states that "wrought-iron girders of ordinary construction are not safe when submitted to violent disturbances equivalent to one-third of the weight that would break them."

The Language of the Workshop.

It might surprise an English inquirer into nautical philology to learn that much of the language of shipboard was very good Dutch, Low German, and even French. It might shock his national pride to find that the terse phraseology over which he had been accustomed to chuckle, as so thoroughly English, was but the echo of the language of the Havre de Grace, the Vorsetzen at Hamburg, or was borrowed from the dictionary (if he had one) of Van Tromp. Yet this is the simple truth; and the same common parentage may be traced in much of the ordinary language of the goldsmith's workshop. Although, like water-worn pebbles, the technical words there in use are now smooth enough English, if we trace their original structure we shall find that in grain they are often German or French.

It is not, of course, here intended to trace the etymology of general language, but merely to show, and endeavour to explain, in what cases the English language of the workshop has been supplied from foreign sources. It would not be requisite, for example, to dwell upon the fact that the word *goldsmith* is our English version of the German *Goldschmidt*, or that *Juwelier* and *joaillier* are the German and French of our own term *jeweller*. These derivations are so obvious, and belong so completely to the ordinary process of transmutation of one language into another, that they do not claim especial notice. But there are words of daily use among workmen, which have been so completely distorted in the passage from the foreign into the English language, that they not only could never be recognised in the tongue to which they originally belonged, but they have absolutely either no meaning, or an entirely false one, out of the narrow circle of their daily use. What, for instance, is a *sparrow-hawk?* We know there is a small species of falcon of that name, but this fact will not lead us far in the solution of our question. The *sparrow-hawk* of the jeweller's shop is no bird at all, but, as every workman knows, a small anvil with two pointed ends, one round and one square. Why, then, a *sparrow-hawk?* Simply because it is derived from the German word *Sperrhaken*, a closing or riveting hook. This is intelligible enough; but having no meaning to an English ear, it has been altered to mean something, however far removed that something was from its actual signification. In French, the tool *sparrow-hawk* is called a *bigon*, and in some parts of England a *bickern*, evidently derived from the same word. Is it not possible that they may both be alterations of the Latin *bicorne*—two-horned or hooked? Time has done stranger things, in the way of transmutation of tongues, than this.

Then we have an ominous-looking word not at all fitted for a tool in the hand of so peaceful a man as a jeweller—a *bull-sticker*. What on earth has he to do with a *bull-sticker*—a weapon only fitted for a Jewish slaughter-house? We have only to bring back the word to its original shape of *Boll-stichel*, the German for a rounded graver, and the matter is at once clear. But what is most curious, the German himself does not use the same word *Boll-stichel* to describe the tool for which its mis-interpretation is employed in England. He, more appropriately, calls the same kind of graver an *Ajustirzeiger*, a word which accurately describes the purpose—that of adjusting stones for setting—for which the tool is employed. *Apropos* of this subject of gravers—or scorpers, as we call them—among jewellers, it is curious to note that the English workman does not describe the act of opening the holes for stones for the setter as *adjusting* the aperture, but dropping the prefix, and otherwise distorting the word, speaks of it as a process of *jestening*. Of course, he means to say *adjust*, but habit being stronger than reflection, he takes the word as he finds it, and as it comes readiest to his tongue. In the same way, he never anneals his work, he only *neals* it, the prefix *an* being a redundancy which, in his industrious pre-occupation, he has not time to repeat. These are but trifles, and to keep to the letter in such matters might often savour of pedantry; but it is, at any rate, well to know what one means. The word *scorper*, which is used among English setters as a generic term for almost every kind of graver—except the graver *per se*, which they never use—appears at first inexplicable. Certainly it is not an alteration of scooper, as that term—besides that it is not English at all, *scoop* being the proper word to give the meaning intended—by no means expresses the ordinary signification which it is intended to convey. Setting is not scooping; and it is most probable that the word *scorper* is an Anglicism for *échope*, the ordinary French term for the burin, or any kind of graver used in jewellery. The English *spitsticker* is only a modification of the German *Spitzstichel*, a pointed graver.

We have another word which has not its full signification to English ears—the word *corn-tongs*. Tongs we can understand, although it appears scarcely appropriate in the present instance; but what idea is meant to be conveyed by *corn*, as used in this case? If we were to seek a thoroughly English word to describe the small, neat pair of spring clippers of which we speak, and which are in constant use by both the mounter and the setter, and quite indispensable to the dealer in precious stones, we have one at our hand at once in the word *tweezers*. But although a pair of tweezers may be an admirable implement on a dressing-table, it will not answer, however like in shape and character, for the corn-tongs of the jeweller's workshop. The German word, *Kornzange*, is the original of our *corn-tongs*, only that the High German word *Zange*, meaning *pliers*, has been softened into *Tonge* in the Low German, which has more affinity to the English or old Saxon. The word *Korn*, with its plural, *Körne*, means a small grain, or particle of anything; and thus a pair of small spring pliers, to pick up or arrange small stones, or minute portions of work, is completely described by the word *Kornzange*, or *corn-tongs*. While upon the subject of pliers, it is noteworthy that, although the word *pliers* is French, from *plier*, to bend, the French themselves do not use it; nor, indeed, do they possess a noun from that root, but substitute another word, *tenailles*—from *tenir*, to hold—in its place. Both the French and Germans speak of pliers in the singular, instead of in the plural, as with us. But this habit is not confined to this word alone; *a* shears, *a* scissors, *a* tongs, *a* snuffers, are all perfectly correct with them, while the Englishman is only satisfied to speak of these pieces of mechanism as in pairs; and not unreasonably either, for, on the same principle, the Frenchman and the German talk of *a* trousers, but who ever heard of *a legs?*

Facts and Memoranda.

Tailors.—We have a saying amongst us that nine tailors make a man. However depreciating our saying may be to that "great maker of men," that of the Chinese is still more so, for they say, "the tailor is the greatest sinner in the world." No sooner has a piece of stuff been finished with infinite toil and industry, than he proceeds to cut it with his huge scissors into unsightly pieces. A Chinese tailor never uses a measuring tape. Instead of trying the arm at the shoulder, the elbow, the wrist, the leg at the hip, the knee, the ankle, the width across the shoulders, the girth of the body, he does all this at a glance; and, with a knowing look, appears to say, "Hum! a little taller than I am, somewhat stouter, a little broader across the shoulders;" or at the most a foot-rule, in a carpenter-like, style is run over the person.

The French Playing Card Manufacture.—To those who indulge in card-playing the following details will have some interest:—French card manufacturers inhabit the Quartiers Bonne Nouvelle, St. Méry, and St. Victor. There are seventeen of these head men, of whom nine employ above eleven workmen. Employing 260 persons in all, card manufacturers make, on an average, 2,000,000 in the year. Of these 260 persons 167 are men, 78 women, and 15 either boy or girl apprentices under sixteen years of age. The men are overseers, painters, pasteboard makers, gummers, cutters, moulders, polishers, bellows-blowers, and porters. The women are sorters, scrapers, pressers. The men work either by contract or by the day, and earn from 4f. to 7f. The women earn from 1f. 50c. to 3f. Apprentices from 75c. (that is 7½d.) to 1f. 50c. They have two hours for meals in their twelve hours' work. Of 67 who can read and write, 15 are noted for bad conduct, and 15 seldom come to work on Mondays. The 78 women are well conducted. All the apprentices are children of workmen, and have been placed by their parents. Card manufacturers pay 30 per cent. (3d.) for the paper band which is round every pack of thirty-two or fifty-two cards. They purchase the paper from the Administration of Indirect Contributions, on which are the faces and ace of clubs, and also the paper on which they themselves print the points. The paper costs, in the first instance, 30f., and in the second, 22f. for 1,000 sheets, which suffice to manufacture 24,000 cards. In 1860 the duties paid on cards used in France alone amounted to 1,395,155f., which was an increase of 200,000f., or £800., on the sum thus paid to Government in 1856.

Coal-cutting Machines.—It has long been matter for surprise that these machines have made so little progress in the hard coals of Northumberland. Several of them have been ordered for some time, but, so far as we are aware, only one has yet been got to work; that is at the Netherton Colliery. We noticed some time ago that the machine had been commenced, and it is gratifying to know that it is now in full work, and is going on most admirably; it is, indeed, a most decided success. It was before explained in this letter that this machine is precisely similar to the "hydraulic coal-cutter," which has been successfully worked some time at the Kippax Colliery, near Leeds. It is by far the most successful machine of the kind yet brought into operation. The motive-power is water, compressed to a high degree by means of a force-pump, worked by a steam-engine, the water being conveyed to the machine, by means of iron pipes, to a considerable distance. The mode of cutting the coal, or shale, adopted in this machine is quite novel, and totally different from that in the pick machines, the process being similar to the action of a slotting-machine. The bar on which are fixed the cutters acting direct from the machine, and the fixing of the machine to the spot where it is required to work, and its progress forwards as the coal is holed, being entirely self-acting, so that when it is once got into working order, very little attendance is required. The Netherton machine, as we have remarked above, is doing excellent work; it cuts the shale underneath the seam, thus preserving the entire seam of coal, and this it does at the rate of 80 square feet per hour, completing about 86 yards in length and 3 ft. 3 in. depth of cutting in ten hours. The coal thus undermined is said to produce 100 tons of good saleable coal. The success of this machine will, no doubt, hasten the adoption of similar machines at other works. One of them has been received at Cramlington, but has not yet been erected, and others are ordered, one, we believe, for the Backworth Colliery.—*Mining Journal.*

*Window Plants and their Culture.**

Amongst easily grown window-flowers, the auricula must be included. The chief requisites for its successful cultivation are plenty of air, with entire freedom from frost, and shading when in flower from the bright rays of the sun. About February, take off the tops of the pots as much earth as will come without injuring the roots, and add some fresh, consisting of equal parts of rich earth and well-decayed manure from the cow-house or the hot-bed. The auricula flowers will be much improved by an occasional watering of manure water, avoiding guano, which would be apt to injure the plants. When the plants are going into blossom, the flowers will be more regular and larger, if some of the buds are taken off with a pair of scissors, so as to give the rest room. The auricula is increased by offsets, which spring up round the plant, and for new varieties, by growing the seed in pans without heat.

The geranium is the next plant to be treated of. Under the popular name "geranium" there are several species included; the name really belonging to those which are like the common scarlet. The proper name of the large flowering kind is pelargonium. However, as the treatment of all is very much alike, they shall be classed together in this chapter, and the peculiarities of treatment necessary to each will be pointed out.

The scarlet varieties are most easily increased by cuttings struck in spring, which will flower the same year, if well grown. Cuttings will grow from March until August. The directions already given being followed, the cuttings will be sure to grow. For these kinds heat is not requisite. For winter treatment, begin to reduce the supply of water, and when the leaves wither, take them all off. The plants, after this treatment, may be put aside in some airy place, where the temperature will be just above freezing point. Throughout the winter, keep the earth just damp, not wet, so that it may not be in powder. In March, they will begin to grow, when the supply of water will need to be increased, and the plants placed in a favourable position as regards light and air. The plants will flower with much more vigour, if the old earth is removed off the top of the pot, as far as possible, without injury to the roots, and its place supplied with fresh. With plenty of water, a little attention as to removing decayed leaves and the seed-vessels as the flowers fall off,

* Continued from page 291.

and now and then a little manure-water, they can be kept in blossom until late in the year. Old plants produce more flowers than young ones, and by judicious pruning they will last in beauty for many summers. They do not require large pots; a pot eight inches across will do for a plant three feet high.

The pelargeniums, or large flowering varieties, may be treated as above in respect to growing cuttings. They are much improved by close pruning. As soon as the flowering season is over, and the shoots are getting ripened, cut them down to three or four inches in length, and for a few days do not give them much water. When the young shoots begin to grow, re-pot the plants —if necessary in larger pots; but if the pots they are in are not filled with roots, rub the outside earth off the top and sides of the ball, and put it back in the same pot, supplying fresh rich earth. The large flowering varieties will not stand so much cold and want of care as the scarlet and its varieties. Though plants in large pots require less care in watering, that is the only advantage they possess; if proper care be bestowed upon the same plants in smaller pots, the flowers will be much finer. The *fancy* varieties require more care during winter, and the cuttings do not grow so freely without a little heat. In other respects, the treatment for windows is just the same as above, except that they do not bear as much pruning.

Another very suitable plant for window decoration is the petunia, both in the single and double varieties. It is easily raised from seed for varieties of single flowers. The double varieties are increased by side-sheets, about one or two inches long, slipped off the main branches; and after a couple of the lower leaves are taken off, plant them in pans of light, sandy soil: they will strike freely, and begin to flower very soon. The nicest way to manage them, is trained over a trellis, or else allow three or four stems to grow long, and tie them as they advance to a single stick placed in the centre of the pot. There is a double purple variety with white spots which looks very beautiful when in full blossom, the flowers are so large and lasting. It continues in bloom for several months in summer.

The calla, or, as it is generally called, the white arum plant, is a very handsome flower for a large window. It is readily increased by division of the roots. It flowers in the spring, and while in a growing state it is one of those few plants that require to have plenty of water always in the saucer. As winter approaches, begin to curtail the supply, and throughout the winter months keep the earth nearly dry. It requires a stiff, clayey loam, with just a little sand or vegetable mould.

Nearly every person has grown the common musk for the sake of its pleasant perfume. It requires, while growing, plenty of water. It is readily increased by division of the roots.

The mimulus, or monkey-flower, of which the above is a variety, also makes a showy window-plant. New varieties are readily obtained by sowing the seed in pots. It will flower the same season it is sown. Old varieties may be grown with ease from division of the roots, or from cuttings from the root or branches, which strike very quickly. While flowering, give plenty of water.

Cactus and mesembryanthemums are among the most easily managed of pot plants; indeed, they seem to thrive upon neglect. To imitate their native climate, they must be kept barely alive during the summer and winter months, from the time the flowering season is over; but while they are growing and flowering, they require plenty of water. The chief care they require is an occasional sponging of their fleshy leaves and stalks, so as to free them from constantly-accumulating dust. They grow best in small pots. Of mesembryanthemums there are numberless varieties, all more or less suited for window culture. Their blossoms are of every shade of colour, and possess a beautiful metallic lustre when the sun shines on them.

The common begonia, which rejoices in so many English names, such as elephant's ear, resurrection plant, or, as I have known it to be called, "end of the world plant," when well grown, makes a fine pot-plant when in blossom. It grows best in sandy loam and well-decayed manure. It requires plenty of water while growing, and during the winter perfect dryness and protection from frost.

Out of Work.

Never mind what my name is. It would be no good to you if you knew. Perhaps it's Brown, or Jones, or Smith. Perhaps it's something else. If you can put me up to a job, do. If you can't do that, lend me half-a-crown, and that will be more to the purpose than asking what my name is. I *am* out of work, there's no mistake about it, and have been so now for nigh six weeks. And I tell you what it is, being out of work don't improve anybody's temper, so if I speak a bit roughish you need not be offended. It isn't just the pleasantest thing in the world to be tramping about day after day to shop after shop, and get nothing but "No, we don't want anybody—very slack just now." It isn't much breakfast a fellow gets before he starts in the morning; and it's precious little dinner there is for the old woman and the four young ones. The rent has not been paid for the last month, that's a fact; and if the landlord don't seize soon, there will not be much left for him. My best coat and boots went first, then the missus's Sunday gown; then our bit of a looking-glass, and the clock; then the fire-irons, and the blankets off the beds. And if I don't get a job before the week's over, the bed will go too—that is, if the landlord don't put a man in before Saturday.

It isn't likely that I should be very lively, is it? or very good-tempered when I go home, and have got no money to give the old woman. Precious little supper we have, and the missus gets cross, and says she don't believe a man who knows his trade so well as I do ought to be out of work, and that it's all my own fault, and she wishes she or the little ones were dead, she does. The pawnbroker don't open before eight o'clock in the morning, and then one of us slips out with a bundle of anything we can make up, and lucky we are if we get enough on it for a quartern loaf, a dab of tenpenny butter, and half an ounce of coffee. And that has to do for breakfast, dinner, and tea, for six of us. And that won't last long, I can tell you; and what will be next, I don't know. I won't go into the house, and if the relieving officer shows his face, and gives us any of his bounce, he'll just get something he won't like. As for the landlord, he may seize, and be hanged. I am just about desperate, and don't care.

No; it isn't the first time I have been out of work. Not by a good many. I have been out through badness of the times, out on strike, and out because I got a drop too much overnight, and wasn't going to stand the governor's talking to me; but I have almost had enough of it. When I was out on strike, it was for nearly three months, and I had an allowance from the society. But it was not half enough to live on; and, besides, I got lazy, and did not care about doing work when I got it again. We went out for short time, and we got it. So I left off work an hour earlier, and we were so pleased with our victory, that I and two or three more of us used to go to the public to talk about it, and say that we ought always to stand up for such things. But I suppose I talked about it too much; for I made short time, too, in the morning, and could hardly tell the difference between a jack-plane and a mortising-chisel when I got to the shop. So the foreman sacked me, and I was out of work again for a month; and if the old woman didn't jaw me, my name isn't what it is.

Some men that I know make their wives go out to work, and it would not be lucky for them to talk about short time. What's good for the gander isn't good for the goose in that case, I can tell you. They have to pull out pretty strong, from seven in the morning till nine at night, for two shillings a day and their victuals; and if they don't bring home something for their husbands' supper, they had better look out, that's all. But I never could bring myself to that. When I first knew my missus, she was a smart, tidy girl, with a pretty face, and we started together very comfortably; and though now-a-days, when trouble touches us, neither of us has the best temper in the world, I can't be such a brute as to make her suffer more than I can help, for what, perhaps, is more my own fault than that of anybody else.

I suppose great folks have troubles, though they keep them from the world, and if they knew our out-of-work troubles, perhaps they would feel that we are all of us very much the same flesh and bleed after all. I have seen some awful sights, I can tell you. I knew a fellow who began well enough, but who went regularly downhill. He never could keep in one shop, was out of work half his time, and, at last, didn't seem to care whether he had work to do or not. Careless and desperate altogether, violent and brutal, too. Perhaps it was despair made him savage; perhaps his wife nagged him too much; but it would have been a mercy if she had been quiet in the grave. I knew her when she wasn't half a bad-looking girl, and their rooms were comfortable enough. But there isn't a stick there now; all gone, and friends are gone, too; and if there ever was any love, that's gone, too; and she screams and scolds, and he swears and threatens. It isn't more than a week ago he and I were standing together, wishing we could find twopence for a pint, when she crawled round the corner, caught hold of him, and looked in his face with her eyes close to his. Pale and dirty, hungry and vicious, beaten down by poverty and misery, she glared at him, and hissed rather than spoke as she asked him for money. He pushed her off, and swore at her; and then if she didn't curse him to his face, and tell him he was murdering her and the little ones, and she would never leave his side, but go about with him, and tell everybody what a lazy, drunken hound he was. I saw something in his face, and I stepped between them; but he pushed me away, and in another minute his rough, strong hand shet out into his poor wife's face, and she fell backwards, bleeding, on to the hard stones.

That's one little bit of out-of-work life I have seen. It isn't always so bad, but it's sometimes even worse. There was another man I knew, and he had a long spell of it. It wasn't exactly his own fault, either, for he was a steady chap; but things went against him. They had about come to the worst, when one night he and I were going along by the canal there at Bow. We had been tramping about all day, and were right down tired. "I can't stand it much longer," he said, and then he stopped and looked serious. It was a dull sort of night, and the water was dark and dirty, and went along with a sort of thump, thump, against the banks. "It wouldn't take much to put an end to it," he said, and looked right into the muddy water before us. I saw that he trembled, and turned very white about the mouth. "Just you come along," I shouted; "come along with you, and don't say that again." And I caught hold of him, and almost dragged him away from the canal. I never left go of him till I had got him home; and then, sure enough, we found he had been sent for to a job in a good shop, and there he is now, and likely to keep there.

If you want to have the blues, be out of work for a week or two; or if you want to know what landlords can say, or what loan societies are like, or what sort of fellows pawnbrokers are, or how chandler's shop-keepers can say nasty, sneering things, or how miserable the wife and children can be, or how easily good temper changes into bad, or how wretched it is to be in debt, and under somebody's thumb, or what queer thoughts can come into the head, especially at night-time—just, as I said, be out of work for a few weeks. You won't like to repeat the experiment.

As for me, I am out of work now, and don't see my way to a job. But sooner would I break stones by the roadside, or sweep the streets—ay, sooner be out of the way altogether, than be out of work.

THE WORKMAN'S CITY.

The Paris correspondent of a Birmingham paper writes:—"The *Cité Ouvriere*, just completed by the Brothers Japy, the great manufacturers of hardware in Paris, is regarded as a very revelation by all who have been so long eager to solve that most difficult of all questions—great accommodation involving little labour —privacy for the home of the working man. It was the fashion in former times to begin the description of a work with the description of the author. In this case the portrait may be painted in the most flattering colours, and needs no varnish. The wondrous achievements in industry accomplished by the brothers have become matters of history. At the great London Exhibition they obtained the prize medal for cheapness in the section of clocks and watches, beating out of the field, not only in workmanship but in price, their Swiss and American rivals. Since that time they have perfected their machinery to such an extent, that they are enabled to furnish articles of domestic use at a lower rate than any other manufacturers. The emigrants

from Germany to America and Australia find it worth their while to land at Havre, in order to provide themselves with the panakius and beef-steak pans made by Japy. The cooking cans furnished for the camp at Chobham were made by Japy Brothers, and several heavy contracts for the British colonies have been likewise executed by them. 'You never can make so cheap or so well certain utensils in iron or tin plate,' says Japy triumphantly, 'because of the cheapness of your raw material!' The argument takes the listener by surprise, but the solution arrives quickly, 'and therefore it has never been worth your while to perfect your machinery!' And with this good Japy points to his wonderful machine, which, with the sole management of a boy, can turn out 1,200 frying-pans a day. 'It is by cheapness alone that we have grown rich,' says Japy. 'This lesson we took from the English manufacturers, and we are now resolved to beat our masters in that one principle by every means of honourable competition in our power.' The marvels of cheapness to be presented at the Great Exhibition by Japy Brothers are said to surpass everything of the kind yet beheld. The late Mr. Cobden was so struck by the earnestness with which these great manufacturers were pursuing this object, evidently destined to become the most important of all in the industrial arts of the future, that he made the journey to Beaucourt in the Haut-Rhin for the express purpose of enabling himself to judge of the comparative resources of their factory with those of Birmingham. He returned overwhelmed with surprise at the results obtained, and described the extraordinary sensations with which he ascertained beyond all doubt that Japy Brothers, by dint of adopting every suggestion offered by their workmen, and thus combining the inventions of science with the experience of practice, had arrived at such perfection in their machinery that the raw material (at that time paying a heavy duty), after having reached Beaucourt with expense of carriage, could be manufactured into a utensil of household use, and returned to England again, paying carriage and duty a second time as a manufactured article, and yet upon sale leave a handsome profit to the manufacturer. It is at this same factory of Beaucourt in the Haut-Rhin that the Brothers Japy have been enabled to realise another problem which has puzzled the political economists of all ages—that of a comfortable existence for the workmen, which shall combine the habits of cleanliness and independence of the *bourgeois* classes, with the strict economy needful to ensure expenditure within the limits of his income, and at the same time leave a surplus for the necessities of sickness and old age. The experiment of creating not merely a fitting habitation for the workman, but an actual property, has been already tried, but in the case of Beaucourt has been alone successful. The company has arrived, by comparison and study of other attempts of the same kind at Mulhouse and Guebuillé, to the complete levelling of all difficulties. The company, moreover, disclaims all profit, and merely seeks utility as reward for the risk and trouble incurred in the construction of the Model City, pronounced to be the very perfection of that idea which has been germinating in the brain of every philanthropist as the necessary complement to the scheme of universal education, by which alone humanity can hope to be saved. The capital of the company amounts to 100,000 francs, in shares of 100 francs only, so that the workman himself will be enabled to contribute to the work. Interest at 5 per cent. is guaranteed by Japy Brothers. The design for the habitations was communicated by one of the workmen, whose experience had taught him to recognise the weak points of the other institutions of the same nature. Each dwelling is composed of a ground-floor, with cellar, and the door of the habitation opens on the kitchen, in the corner of which is the staircase, leading to a wide granary or lumber room beyond in the roof. Behind the kitchen is a large room, and to the left another chamber of ample size, communicating with a third. All four rooms are large, lofty, and well aired.

The value of these tenements, containing, as you may observe, space enough for the accommodation of a large family, is not more than 2,000 francs, while those of Mulhouse, with one room less, and no staircase or granary, are not to be purchased under 2,500 francs. The ground on which the *Cité* of Beaucourt is built is a free gift on the part of the Brothers Japy, and payment of the building has been secured by a novel combination of interests worth recording. To every purchaser a credit of 2,000 francs is opened. The term accorded for payment is eleven years, by instalments, payable at the purchaser's own convenience. No particular date is fixed for receiving the instalments, provided the whole be paid off by the term appointed. The company demands no further indemnity for the risk of building. The result of this amicable arrangement has been that four of the houses are already paid for *in toto*, and the first year of the experiment is not yet expired. Another fact worthy of remark is that the construction of each tenement is only commenced upon demand of the workman who is to become its occupant and ultimate purchaser. Thus the *Cité Beaucourt*, begun in August, 1865, displays already a goodly row of ninety-seven houses, each with its little patch of garden ground, its trim porch and trailing plants presenting to the eye a true picture of health, comfort, and cleanliness not to be surpassed even in England. The plan of the buildings is peculiar likewise. The houses are run up in rows on each side of the street, blocks alternating, so that the air and light are freely admitted, and the inconvenience of opposite neighbours wholly avoided. At present the experiment made by the Brothers Japy may be considered as wholly successful, but the slow and prudent method of construction may conduce to a greater degree of perfection still."

Things Talked About.

If ever the editor of a popular periodical, bound to record the stirring events of the day, could realise the picture sketched by Artemus Ward of the politician who had always a "good stock of impending crisis on hand," it is just now. Abroad, the expectation of immediate and terrible war is paralysing speculation and crippling industry, and the effects are already felt in the households of the middle and working classes. At home, there is such a monetary panic as has not been paralleled for more than forty years. The memorable year '25, which brought sorrow to so many, is now referred to as the only period comparable to this present '66. The railway panic, twenty years ago, was, at its worst, not so bad as the crisis we are now passing through. The failure of the great discount house, Overend, Gurney, and Co., has involved so many other large establishments, and on those, again, depend a multitude of smaller firms and employers of labour, that the keenest financial vision must fail to trace the course of the disaster. But we may assuredly predict that it will penetrate to the remotest verge of the kingdom, and be felt in every department of our national industry. The approaching war—or even the threat of war—is already interfering with the foreign transactions of our manufacturing firms, and should the struggle be protracted, German and Italian capital will no longer flow into our markets.

None can say, then, that working men have not a vital interest in watching the course of events. We speak in all sincerity, believing that we have their best interests at heart, when we beg of them to consider the position in which their employers and themselves may be placed. This is no time to press extreme demands, to raise questions which will still further embarrass the operations of capitalists and employers. Many large undertakings will probably be affected, and the number of skilled workmen wanting employment be added to. Masters will possibly have to pay dearly for the capital requisite to carry on works of imperative necessity. Trade bills may have to be discounted on crippling terms, and customers will stretch their credit to the full. Only in the union of interests can there be safety. *The employers' difficulty is not the workmen's opportunity.* Add agitation and strikes to commercial distress, and the result will be such as any man might shrink from contemplating. The permission given by the Government to the Bank of England to increase its issue of notes will no doubt avert the worst consequences; but there is enough of difficulty left to make all classes think seriously.

The Imperial Gas Company will *not* pollute Victoria Park with poisonous fumes. The agitation has been so far successful that the House of Commons would not suffer the Bill to go a second reading, or even into committee, with the chance of the obnoxious clauses being a little modified. Lord John Manners and Mr. Beresford Hope led the attack; Mr. Cowper, on the part of the Government, faintly supported. No one had a word to say in favour of the Bill, and so Mr. Staniland, the member for Boston, who had it in charge, withdrew it altogether, to save the disgrace of an overwhelming majority against him on division. The Chartered Gas Company's project has now to be dealt with.

Not only the Imperial and the Chartered, but the other London gas companies must prepare to meet the public on another point—the price of gas, a question of great interest to all manufacturers, and, indeed, the community generally. We have every reason to believe in the truth of the following statements, which we find in the columns of an influential daily newspaper:—"Whilst London has been paying 4s. 6d. per 1,000 cubic feet of gas giving an illuminating power equal to 12 sperm candles, Manchester has been paying only 3s. 6d. for the same quantity, giving an illuminating power of 20 candles; in other words, 850 feet of light have been given for the same price as 1,000 feet in London. The cost of the public lighting in Manchester has been 25s. a lamp, against an average of £5 in London, and beyond all this upwards of one million of money has been spent in improvements in the city of Manchester out of the profits of the gas-works, and this in the face of the fact that whereas coke, the principal residual product of gas manufacture, fetches in London more than half the price of the coal, in Manchester it is nearly unsaleable. In Walsall, the Corporation supply gas to the citizens in direct competition with one of the wealthiest companies in England, obtain a handsome profit, and keep the price of gas lower in the town than in any other district supplied by the same company." In Birmingham, gas of superior illuminating power is supplied at 1s. per 1,000 feet less than in London; in Sheffield, 7d. less; and in Edinburgh and Glasgow (more than twice the illuminating power) only 5d. more. We could extend the list, but these instances are sufficient to show what enormous profits the London companies must be making.

From gas to coal is an easy transition, and we note with some satisfaction that we are likely to have more trustworthy data for estimating the probable duration of our coal supply than the statements on which arguments of a sensational character have lately been founded. The Government have consulted the Geological Society, through the president, Sir Roderick Murchison, on the subject, and some valuable information will doubtless soon be supplied. In the meanwhile, the *Times* gives unusual prominence to an article "from a correspondent," who evidently is an authority on the subject, and remarkably confirms the views we expressed a week or two since. The writer says that, even supposing the estimate of the future yield of the British coal-fields to be correct, its exhaustion within the next hundred years, as predicted, can only take place supposing these improbable contingencies to become facts:—The population of the British Isles must, within that term, increase to 576,000,000 (nearly half the present population of the globe); the railway lines in England must be 24 times their present length; the same ratio of increase must take place in the production of pig-iron; and the number of persons engaged in the iron manufacture must be multiplied by 26. As none of these things are likely to occur—it would be difficult to find room in England for twenty times its present population, for instance—we may make ourselves tolerably easy as to the duration of our coal supply.

The Working Man is already quoted as an authority in discussions on the condition of the working classes. In a paper read at a recent social meeting of the Working Men's Club and Institute Union, Mr. Bainbridge made a special reference to our articles. We are pleased at this testimony to the success of our efforts.

The Operatives' House Building Company are about to purchase, as the scene of their first operations, some land in Old Pye Street, Westminster, now occupied by most miserable habitations, which will be speedily demolished, and improved dwellings for working men placed on the site. The company have had a meeting at the residence of the Marquis of Townsend, who presided; and the objects of the company were warmly advocated and supported.

The Liverpool Town Council, influenced apparently by a letter from Mr. John Stuart Mill, have agreed to devote certain corporate lands for sale for the erection of labourers' dwellings, and to purchase a quantity of land in the centre of the town for a similar purpose. Mr. Mill, in his letter, states the case with his customary felicitous terseness:—"If I thought that such a measure would injure the independence of the working classes, or encourage their improvidence, I should strenuously oppose it. But the case seems to me to be one of a class of cases in which people require artificial help to enable them afterwards to help themselves."

The dockyard labourers at Portsmouth have memorialised the Admiralty for an increase of pay. The present wages are positively inadequate to the support of the men and their families. We hope they will not be snubbed by the authorities as the Post Office servants have been. Many of the rural letter-carriers have appealed to the public to assist them in dispensing with a Sunday delivery; and, in consequence, "general instructions" have been issued from the Secretary's department, in which all the men are informed that, "For the letter-carriers and others to take an active part in soliciting the interference of the public in their official duties is objectionable on obvious grounds, and the distribution of such letters, even out of official hours, is in direct violation of the regulations of the service."

Several dyers at Leeds have been committed to prison with hard labour for intimidating and assaulting their fellow-workmen; and at Guildhall, London, a tailors' cutter has been sent to prison for a month for absenting himself from work without permission. It is not generally known what punishment the law allows for the offence of quitting work without due notice. Three months' imprisonment with hard labour may be awarded.

General Information.

CLUBS AND INSTITUTES.

Child's Hill, Finchley Road.—The Working Men's Club and Institute in this place held a tea-meeting on the 7th instant, when Dr. Lankester, president of the club, and coroner for Middlesex, occupied the chair, and the Rev. H. Solly gave an address. Although the population of this village is very small, the club numbers eighty members, and is in a highly prosperous and hopeful condition. Mr. Morse, its active secretary, read an interesting report, and the chairman summed up the proceedings with an earnest appeal to the working men to support the club and extend its usefulness. Hearty votes of thanks to that gentleman and Mr. Solly concluded the meeting. A handsome present of interesting books from J. Gurney Hoare, Esq., was placed on the table during the evening.

South Staffordshire Adult Education Society.—This useful society, in consequence of a resolution

adopted at the Working Men's Club and Institute Conference, held in Bilston last November, having considered the requirements of Working Men's Clubs in this district, resolved on dividing their work into three departments, under the management of district Boards. One of these is specially devoted to Working Men's Clubs, and held its quarterly meeting on the 30th ult. at West Bromwich. The attendance was not large, and several of the reports were far from encouraging; but the delegates from Birmingham, Heath, and Oldbury reported very favourably. The Clubs also at Wednesbury and Wolverhampton are doing very well. After tea had been dispatched, and Mr. Jones, the secretary, had read the reports sent to him, an interesting discussion took place in regard to the best mode of keeping numbers together in the summer months. The Rev. H. Solly, who attended to represent the Parent society, recommended out-door games, whenever ground could be procured, and especially athletic sports, which can be carried on in a much smaller space. He suggested that these might always be made preparatory to a general out-door festival for the whole town and neighbourhood, to be held towards the end of the summer, at which there should be a competition for prizes, and which would give zest and additional interest to the exercises and trials of skill throughout the season. Field-classes, with botany and natural history excursions, were also suggested. Mr. Jones approved of both suggestions, but said that the festivals, in general, must be confined to each particular locality, on account of the impossibility of getting holidays at all (or even many), of the works in South Staffordshire on the same day. A long and important discussion then followed on the question proposed by the Working Men's Club and Union for a prize essay, namely, "What social changes or other measures would procure a larger attendance of working men at these Clubs and Institutes?" Several of the delegates expressed a strong opinion that in South Staffordshire, where the work is very hot and exhausting, the men would never attend the Clubs in any large numbers unless they could have their glass of ale at them. Mr. Solly urged the arguments against this view, which were given in full length in his letter to the friends at Leicester,* and maintained that, under a system in which drinking was allowed at other than meal times, in the way of mere tippling, the Club would soon become little better than a mere beer-shop. Some of the delegates replied that it would make all the difference if the men were relieved from the pressure of the landlord, and that what, in fact, was wanted was co-operative public-houses, which, they considered, would completely meet the present evils, and would be a stepping-stone to something better. It was ultimately settled that the whole subject should be brought forward for special discussion at the next delegate meeting, towards the end of June, and efforts should be made to secure a large attendance of delegates. In the course of the evening James Solly, Esq., J.P., iron-master, expressed his belief that the large employers of the district would lend any reasonable assistance in promoting the objects of the meeting, but quite agreed with the delegates that it would be far better if such measures could be devised as would bring the men to the Clubs in numbers sufficient to make them self-supporting, without any extraneous aid. The help of the iron-masters might, however, be very valuable in giving opportunity for bringing the whole subject under the notice of their men. Thanks being voted to Mr. Guest, of Handsworth, who occupied the chair, and to the Rev. H. Solly, for his attendance, the meeting separated.

Working Men's Club and Institute Union.—On Thursday evening last the anniversary festival of this institution was held at the Freemasons' Tavern. His Grace the Duke of Argyll took the chair, supported by Earl Grosvenor, the Earl of Lichfield, Lord Lyttelton, Major-General Lord Frederick Paulett, Hon. Dudley Fortescue, M.P., Mr. Samuel Solly, F.R.S., Mr. Layard, M.P., Mr. Davenport Bromley, M.P., Sir John Pakington, M.P., &c. After proposing the health of the clergy of all denominations, and denouncing temperately, but strongly, the introduction of any sectarian differences into these Clubs, the chairman gave the toast of the evening, "Success to the Working Men's Club and Institute Union." His Grace did this at considerable length, and vindicated Trades' Unions and similar combinations of labour from the charges he alleged had been unfairly brought against them. He claimed that these associations did no more for their fellow-workmen than the Parliament had done for these workmen's wives and children in limiting the hours of labour under the Factory Act. That Act was passed to prevent excessive competition of labour bringing about a system of overwork, and as Parliament had declined to include in the same Act the adult male labourers, the Trades' Unions had been striving, and not altogether without success, to obtain the same end for themselves. Some of these organisations had very large annual funds, and these were on the whole economically distributed. It was true, unfortunately, perhaps, that the working men did not as a body contribute to these Clubs; nor did the Trades' Unions support them. On the whole, however, he thought it was not very desirable, considering the main views with which those organisations of labour were formed, that they should have the support, and therefore virtually the control, of such associated institutes as that the cause of which he most earnestly then commended to the benevolent consideration of his hearers. He was pleased to find the progress which the movement had made, but he was of opinion that it required the support of the middle and upper classes, and also of the Church, to make them in every way valuable institutions, and permanently serviceable to the country. After paying a high compliment to the Rev. H. Solly for the great exertions he had made to forward the movement, the Duke of Argyll concluded by recommending the Working Men's Club and Institute Union in London, and all over the country, to the sympathy and support of all friends of the working classes. The Duke of Argyll next gave the "President and Vice-Presidents," remarking that Lord Brougham was, as they were aware, the president of the Union, and he believed that it had few better or truer friends. The Earl of Lichfield, one of the vice-presidents, responded, and declared his conviction to be that if they wanted to make these clubs successful, they must make them as attractive as possible. He referred to the present licensing system, and pointed out the necessity which existed for some improvement and some legislation. Sir J. Pakington, M.P., proposed the health of the noble chairman, and agreed with the Duke of Argyll in the belief that all classes of politicians were harmonious upon one point, and that was, the promotion of the prosperity of the working people of the country. With respect to the education question, he could not agree that these clubs could not always be made to answer the purpose of mechanics' institutes. Amongst other toasts were "The Council," responded to by Mr. Morgan Thomas; "The Organising Director, Rev. H. Solly," by Lord Lyttelton; "The Social Elevation of the Working Classes;" "Harmonious Co-operation between all Classes of Society;" and "Prosperity to the Clubs," responded to by working men. The noble duke's speech was loudly cheered, and a satisfactory list of subscriptions rewarded his exertions on behalf of the institute whose cause he had advocated. All the arrangements connected with the dinner were admirably managed, and a most pleasant evening was passed.

EMIGRATION.

Emigration from the Iron and Coal Districts.—Last year a vast number of colliers and ironworkers, with their wives and families, emigrated from the mining districts of South Wales to America—in fact, the exodus was so great that it was with difficulty many of the works could be kept fully and regularly going. At the beginning of the present spring a similar movement pervaded the district; and in consequence of the numbers that broke up their homes for the purpose of emigrating to the New World, fears began to be entertained that the operations of the iron works and the collieries—more especially the latter—would be again seriously interfered with. Several letters, however, have lately been received from those who went out last year, giving a most deplorable picture of the state of things in the United States, and warning those at home to stay where they are well off. This has had the effect of materially checking the emigration movement, and most of those who were making preparations to take their departure have changed their minds, and have determined to remain in the country, being at last convinced that a moderate rate of wages and regular employment are to be preferred to the uncertain result of emigration to the States.

Co-operative Intelligence.

Mansfield Co-operative Society.—This society has just issued its seventh quarterly report, which states that the profit made this quarter will allow a dividend of 1s. 8d. in the pound to members on their purchases, and 10d. to non-members, besides placing £9 15s. 10d. to the reserve fund, and £3 13s. 2d. to the educational fund. From the financial statement, it also appears that £2,035 1s. 6d. has been taken in the stores during the quarter, and that 131 entrance fees had been received during the same period. The profit on the sale of goods during the quarter had been £145 14s. 7¾d. So numerous are the applications for membership, that the society intends, for a time, to decline taking in more members.

Blakey Moor Industrial Co-operative Society (Limited).—The twentieth quarterly report of this society has just been published. From it we learn that the society is making rapid progress. During the quarter ninety-eight new members have been admitted, and only two have withdrawn, which makes the present number 383. Goods have been sold to the amount of £2,944 9s. 9d., being an increase on the previous quarter of £907 11s. 3½d., and £1,697 15s. 9d. on the corresponding quarter of last year. The profits resulting therefrom, after deducting working expenses, interest on shares, depreciating the fixed stock, and allowing non-members 6d. in the pound, amount to £168 7s., which will give a dividend of 1s. 4d. in the pound to members on all purchases, and leave a balance of £1 4s. 4d. to the reserve fund. A brief review of what has already been accomplished by this society must be gratifying to all who desire to extend its usefulness. Though it has only been in existence five years, and, as is well known, during much of that time Lancashire has been suffering from a depression of trade almost unparalleled, it has sold goods to the amount of £22,752 8s. 11d., by which a profit of £1,310 1s. 3½d. has been realised, which has been disposed of as follows:—£65 3s. to non-members, and £1,184 3s. 8½d. to members in proportion to their purchases through the stores, leaving a balance as a reserve fund of £60 4s. 1d. The profits derived by purchasing at a Co-operative store instead of the shops of retail dealers, must have been of great service to many during the late bad times.

Northampton Progressionists' Industrial Society.—The members of this society held their twenty-ninth quarterly meeting on the 8th instant, when the report for the past quarter was laid before them by the committee of management. From the report it appeared that the business done was over £8,000, on which is realised, after paying all working and necessary expenses of management, a net profit of £838 15s. 8d. The committee advised a further subscription of four guineas to the General Infirmary, in addition to the usual annual subscription of £4 4s.; and they also advise an additional subscription of two guineas to the Homœopathic Dispensary, in addition to the same amount which they already subscribe. Allowing a dividend of 2s. in the pound on members' purchases, a balance of £12 14s. 4d. would be left to carry forward, besides £188 14s. 10¼d. in the hands of the treasurer or in the bank. The committee, at the solicitation of several members, purpose establishing, in connection with the society, a coal club, and also a clothing club. The reading-rooms in Grafton Street and Wellingborough Road are fitted up with every comfort and convenience, and supplied with the local and leading newspapers, magazines, and periodicals of the day. There is also a library, consisting of above 800 volumes of standard works on a variety of subjects, which are circulated free for the use of the members of the society. The report was unanimously adopted.

Gateshead Industrial Co-operative Society.—The nineteenth quarterly report shows that during the quarter fifty-nine new members have been enrolled, and that ten have withdrawn, leaving 466 on the register. The sales during the quarter have amounted to £2,824 1s. 1¼d., being an increase of £355 16s. 3½d. over the previous quarter, and have produced gross profits of £392 12s. 1½d., or 16 per cent., which, after deducting working and other expenses, leaves a net profit of £244 9s. 3¾d., or 10 per cent., which has been divided as follows, namely:—£10 to the reduction of the fixed stock; £4 4s. 1¾d. to the reserve fund; and the balance to a dividend of 1s. 10d. in the pound on members' purchases.

Co-operation in the Leven Valley.—A meeting was recently held at Haverthwaite to take into consideration the desirability of forming a Co-operative Society in the district. The majority of those present were working men, and all were in favour of a Co-operative Society being formed. A committee was named, several resolutions were passed, and the shares fixed at £1 each; no person to hold more than five shares. Nearly sixty shares have already been applied for, and the encouragement the promoters have met with is quite sufficient to justify them in carrying the matter forward.

Sowerby Bridge United District Flour Society (Limited).—According to the twenty-second half-yearly report, the flour sales have reached 24,151 packs, and the sale of other goods 15,152, making a total of 39,303, and being an increase of 6,303 packs over any previous half-year. The gross sales for the half-year amount to the sum of £55,700, being £11,719 in excess of last, and making an average of £2,140 per week. The profits are £2,941 3s. 10½d., which, after paying £591 6s. 7d., the interest due on members' investments, at the rate of £5 per cent. per annum, leaves a disposable balance of £2,349 17s. 3½d. The committee recommend a bonus of 10d. in the pound on the above £55,700, which will leave a balance undivided of £29 0s. 2½d. During the year just ended the society has sent out 72,924 packs of all kinds of goods, representing in cash the sum of £99,681 10s., and the capital has been increased from £18,478 19s. 2½d. to £24,988 1s. 3½d., thus giving a clear indication of progress and prosperity.

Clifton Co-operative Industrial Society.—The sixteenth half-yearly report of this association shows the receipts during the quarter to have been £3,856 18s. 6d. The liabilities are £926 6s. 11d.; the assets, £1,285 11s. 10d.; and the amount of dividend, 2s. in the pound.

Newcastle.—At the twentieth quarterly meeting of the Local Co-operative Association, the report for the quarter ending 4th of April was read by Mr. Proctor secretary, and unanimously adopted. Considerable progress has been made during the quarter, seventy-seven new members having been added, an increase of sales amounting to £332, and over the corresponding quarter of last year an increase of £920. After paying all charges, interest on capital, £5 10s. to depreciation of fixtures, and £3 18s. to reserve fund, there remained a dividend of 1s. 9d. in the pound for members' purchases. Arrangements have been made to commence immediately the butcher business.

* Since published by the Union as an Occasional Paper.

Correspondence.

**** We shall be happy to receive early information of general interest from Secretaries of Societies, Clubs, or Institutions, to be addressed to the Editor of the* Working Man, *La Belle Sauvage Yard, Ludgate Hill, London, E.C.*

We do not hold ourselves in any way responsible for the opinions expressed by Correspondents.

UNITED STATES *versus* CANADA.

To the Editor of the Working Man.

Sir,—The letter of the correspondent writing for the *Times* from Canada, which you copy into the Working Man, under the heading "Emigration," in my opinion, is calculated to mislead persons who are, perhaps, contemplating emigrating to the United States, inasmuch as the statements are not correct. First, the correspondent says that the province is vastly different now from the United States, and, also, from what both were before the war. Then, he says, Canada paid taxes and duties; the United States paid none. This is untrue. The United States has always paid taxes. Labour found a good market in the States, and prices were low. Labour now finds a far better market there than for the last ten years, and at a higher rate of wages. Where it was one dollar it is now three, and more. It is Canada that holds out every inducement to emigrants, says the correspondent of the *Times*, and that in the very first part of the article. He might have waited to the end, or left the emigrant to judge for himself, after stating what he had to say. I say Canada does not hold out one-third the inducements to emigrants which the United States do, and I think I can prove it even by the correspondent's own statements. He says that prices are nearly thrice as high in New York as they are in Canada. Is New York or Chicago the United States, or are they only small parts of it? They are both great ports, which have a very fluctuating population, and prices in consequence are higher; but even then, ten cents a pound for beef in Canada against thirty cents in New York or Chicago is only at par or equal to one dollar a day, the rate of wages in Canada, against from three to four dollars a day in the United States. Mechanics and labourers who will go out West can get good beef at fifteen cents a pound, and have constant work at from two dollars for labourers to four dollars for mechanics. Again, New York is put for the United States, when every one who has been to America knows that prices are always nearly twice as high there as anywhere else in the United States, and emigrants do very wrong to remain in New York, as wages are lower and living much higher. Mechanics should remember that the reason of goods being cheaper in Canada than in the States is, that they go there free of duty, and thus the mechanic has to compete in Canada and Australia with low prices for all goods brought in there from England, so that he is but little better off there than here for that reason. In the States, better prices prevail for nearly every manufactured article. Then it is stated that there is no temptation to the Canadians to go over to the United States, nor are they craving to have the United States' debt put on their shoulders. The Canadians can hallloo just now. Let them be careful not to create a war debt. They may, perhaps, do so without any blame to themselves, as the Federals were compelled, in self-defence. Then again, during the United States war, Canada certainly did get a great influx of persons from the United States—runaways from the draft, deserters from the Federal army, and Confederate spies, raiders, and incendiaries; and if there are any who leave the United States now for Canada, to escape the just payment of their share of the United States' debt, I say good riddance of such mean and dishonourable people. They are no good to any nation. Now, to close these few remarks, I will only add that the truest part of the correspondent's letter is where he says that self-interest is perhaps the motive of the Canadian's enthusiasm and loyalty. At any rate they are dependent on England for their supplies, their prosperity, and protection. I am not in the least unfriendly to Canada. I wish it well, but I wish the United States well also. Let facts be made known on both sides. I am certain, even now, with high prices, heavy taxes, and some drawbacks—such as being a little unsettled—that the United States is a far preferable place to emigrate to than either Canada or Australia—I mean for all that live by their labour. Yours,

Fair Play.

ON SPITALFIELDS CO-OPERATION.

To the Editor of the Working Man.

Sir,—Many sincere friends of the working classes see more hope in the future for them from increased wisdom and moderation in the management of their Trades'-Unions than from the prospect of Co-operation being generally or extensively taken up by them. Whilst cordially rejoicing in the good done by the Co-operative system in many individual instances, these well-wishers regret that the ability and moral worth of the managers in these cases have not rather been devoted to the leading of the councils of the Unions, so as to make them as permanently useful to the workmen as possible. For, they say, in the most sanguine view of the future, Co-operation can never be expected to become more than an exceptional benefit to those whose high character well deserves to share its advantages. The great mass of working men must be benefited and elevated by a true understanding and recognition of their position as such in relation to their masters. But, frankly admitting this to its fullest extent, we see many exceptional cases where Co-operation is a priceless boon to the men whom it raises from desponding want to comfort and content. Perhaps there is no possible combination of circumstances in which all its blessings can be conferred, more unmixed with any possible alloy of attendant disadvantage, than in that of the Spitalfields silk-weavers.

The whole history of these men is full of painful interest; and hard indeed must be the heart that would not melt for them when they have "told their pitiful story." Originally driven by religious persecution from their native soil, they found, like many others, a safe refuge in our peaceful land, and amply repaid the benefit by their skilled labour, enriching and stimulating our manufacturing industry. Those familiar with the history of our most flourishing manufactures will remember many parallel cases in which we owe much to denizens from foreign lands. For long years this little Spitalfields colony worked on and prospered in the weaving of silk and velvet in their households, whilst generally respected for industry and good character. But since the employment of machinery in large factories, hand-loom weaving in cottages has been a doomed business. Sad indeed is the record of its struggles, with yearly lessening wages for increasing toil. For some time silk escaped the fate which has long overtaken cotton. To those who know how manfully the Rochdale and Middleton hand-loom weavers long toiled from dawn to the dark hours, literally at hand-grips with famine day by day, it is delightful to turn to the present prosperity of the Rochdale Co-operative Societies. Slowly but steadily the doom has overtaken the silk and velvet weaving, and the same sad struggle with inexorable decline has been carried on to the bitter end in Spitalfields.

Let us hope Co-operation, well managed, may prove their remedy. Many reasons, indeed, there are why it should be so. The last stronghold of this household weaving has been in the richer and more tasteful fabrics commanding a high price as articles of luxury, and where skill has yet some advantage over machinery in beauty of work, especially in figured textures and patterns. Surely, calling in the aid of good draughtsmen, Co-operation may win and keep here a little field of its own, and the just reward of superior skill be yet reaped by these workmen, now barely enabled by that skill to earn starvation wages. Let an influential London Committee be formed expressly for their help. The patronage of fashion will be willingly given when the case is fully known, for our women have their hearts in the right place in the highest as in the lowest ranks. If this Co-operative Society can only set and register taking designs in high-class goods, where price is cheerfully paid for style and taste, they would be patronised from the palaces throughout the land and flourish. Let us see how they can be helped. C.

PROFESSOR MAURICE.

To the Editor of the Working Man.

Dear Sir,—I see in your impression of to-day a critique on Mr. Maurice's "Working Man and the Franchise," in which the writer repeats the oft-recurring complaint that Mr. Maurice is too indefinite in the statement of his opinions.

As one of the audience to which the lectures now published were delivered, may I offer to the writer the suggestion that Mr. Maurice is a philosopher and a historian, not a legislator; and that it is his business to state broad principles, not to devise means for carrying them into practice?

Also, I think, it will be generally found that when Mr. Maurice does not state an opinion in clear, distinct terms, the cause is, not that he has not a very clear idea, but that either his modesty or his charity, or both combined, prevent him from speaking *ex cathedra*. He aims, I always think, not so much at parading his own opinions before the world, as at giving his readers facts and thoughts on which to form opinions for themselves; opinions which, by being thought out thus, are of infinitely greater breadth and worth than any taken ready made from another. Any one who can follow Mr. Maurice's train of thought will, I think, not often fail to find a very definite meaning very clearly expressed.—Dear Sir, your obedient servant,

William Rossiter.

Working Men's College, May 9th, 1866.

OVERWORKED RAILWAY SERVANTS, AND THE STRIKE ON THE LANCASHIRE AND YORKSHIRE RAILWAY.

To the Editor of the Working Man.

Sir,—Having recently seen in your columns several notices respecting railway men and their grievances, I beg to say there is no class of men at the present time more deserving of public notice than the persons employed upon the various lines of railway.

I have been among these people for many years, and, from being the representative of a society, the name of which you will see at the foot, I have seen and heard of the hardships which they have been obliged to endure. Exposed to all weathers night and day, and sometimes working twenty or thirty hours at a stretch, it is no wonder their constitution is broken; and when incapacitated by lost health or maimed limbs, they are left in too many cases to the cold hands of charity for support. Petitions to the various Boards of Directors have been useless, for when presented, the memorialists have been told that their grievances "shall be considered." But most of the men know now that when their appeals are left to the *consideration* of their employers, it is no use any of them ever expecting a reply. I believe this has been the cause of the men ceasing from work on the Lancashire and Yorkshire Railway. There they have been working fifteen, sixteen, seventeen, and as many as eighteen hours a day without anything extra; and it is to such overworked men as these that the public entrust their lives and property.

I have seen the drivers of goods trains fast asleep upon the "foot-plate," unconscious of the falling snow or rain; and more than one has told me that when travelling in the night the hours of labour have been so great that they have "dozed off," and when they have "started up again," they have only known where they were by passing some familiar spot.

In No. 15, in "Things Talked About," it is stated that if the men of the London, Brighton, and South Coast worked eighteen hours at a stretch, it was to suit their own convenience. I know not whether this be a fact, but this I know and can prove, that on several lines the signalmen are compelled to work eighteen hours, and should anything happen to those whose duty it is to relieve them, several of them would even be compelled to work longer than that.

The time will soon arrive when "excursions" will be running all over the kingdom, and it will perhaps surprise the public when they hear that many of these who have charge of the trains are men who have already been doing a day's work. Often the chief thing the passengers think about when they take their ticket is, How will they find the old folks at home? It would be also as well, perhaps, to think of those in charge of these trains who are employed to convey them to these happy homes, but which many have failed to reach through collisions and the like.

It has been asserted in different parts that I have been travelling from place to place inciting the railway men to strike. I beg to contradict this statement, as I am strongly opposed to anything of the kind. What I have done is this: I have endeavoured to impress upon the minds of the railway working classes the great good they may do by all uniting in one body for the mutual support of each other.

Enclosed is a circular which will also give you some idea of what we are doing, and if you will kindly insert this letter in your next impression, you will greatly oblige yours very respectfully,

Charles Basse St. Vincent,

Secretary to the Railway United Goods and Passenger Guards, Brakesmen, Shunters, Pointsmen, Yardsmen, Signalmen, Switchmen, Porters, Platelayers, &c., Amalgamated Benefit Society.

7, Willow Place, Park Street, Worcester.

[If our correspondent will refer to the article in No. 15, he will see that the assertion quoted was not made by us, but by the directors of the London, Brighton, and South Coast Railway.]

TO CORRESPONDENTS.

E. A.—The population of Stalcybridge in 1794 was 1,100, the number of houses being 200.

J. S. Oldham.—Your question should have been forwarded to the editor of a sporting or agricultural newspaper.

W. W.—We believe the work is published in a separate form, but do not know the price.

H. S.—The question is an important one, but the time has not arrived for discussing it.

A Compositor.—Your letter contains much that is deserving of consideration, but your suggestions have, in a great measure, been anticipated by many of our freehold land and building societies.

Lancashire.—The Factory Acts Extension Act (27 and 28 Vict., c. 48). This Act introduces for the first time the principle of the restriction of labour into the hardware trades, and applies with additional special provisions the Factory Acts. The additional clauses provide that—"4th, Every factory is to be kept in a cleanly state, and be ventilated in such a manner as to render harmless so far as is practicable any gases, dust, or other impurities generated in the process of manufacture that may be injurious to health. Penalty, £3 to £10. 5th, That the occupier may make special rules, to be approved by one of Her Majesty's principal Secretaries of State, to compel his workmen to observe conditions for the required degree of cleanliness and ventilation, and to affix a penalty not exceeding £1." In 1860, Mr. Adderley and Sir Stafford Northcote introduced into the House of Commons a Bill to provide for the education of children employed in manufactures or other regular labour, but it was not proceeded with. Its chief provisions were, that no child should be employed in any kind of labour, for wages, under twelve, unless he could read and write. Any employer might be relieved of the penalty upon conviction, if he would give an undertaking that the child should attend school whilst in his employment for not less than twenty hours every month, until the child had attained the age of twelve.

Parkesine.—The article on *Moulds* in the treatise on Electrotyping, given in No. 19 of the Working Man, will supply you with the information you require. The "shell" will deliver easily if the gutta-percha be laid on a stone or piece of metal in a cold place. Merely tapping it will be sufficient.

Fred. Denison (?).—We cannot recommend dealers in the article in question. The cost of an apparatus varies from £5 to £50, according to size and quality.

M. W. Chorley.—The articles on Electrotyping will include the process of galvanising iron.

G. J. R.—Have nothing to do with the doctor or his machine.

Thomas Gardiner.—Stanley's "Treatise on Mathematical Instruments" costs 5s.; Baker's "Mensuration," 1s.

John Rayne.—1. Gilding metals will be treated in our articles on Electrotyping. 2. Taste is for the most part an intuitive faculty, which may be governed and directed by the principles of art. Instances of bad taste are always apparent to a cultivated mind, but this question of taste involves so many considerations, that it has never yet been treated in a satisfactory manner by any writer; they are all deficient in comprehensiveness. The other subject referred to in your letter was found impracticable in the carrying out.

Jane.—Tweezers are small elastic steel nippers, employed chiefly for pulling out superfluous hairs. They may be obtained of a cutler.

A Learner (Bradley).—The easiest and surest plan is to fill the boiler, and weigh the first pailful. Every gallon weighs ten pounds. It is then a question of simple multiplication only.

WHITSUN HOLIDAYS.

The Zoological Gardens, Regent's Park.—Admission SIXPENCE every DAY in WHITSUN WEEK, except Saturday.

ROYAL POLYTECHNIC.

Wonderful Illusions.—The Cherubs Floating in the Air and the Modern Delphic Oracle (J. H. Pepper and Mr. T. Tobin, Joint Inventors), at 3 and 8—Mr. and Mrs. Henri Drayton's Charming Musical and Pictorial Entertainment, illustrating the LADY of the LAKE, at 4 and 9—Prestidigitatorial Magic by Mr. J. Matthews at 7.30—Dugwar's Indian Feats at 2—Lectures by Mr. King and Mr. Stokes, at 12.30 and 1.30—Science, Poetry, Painting, and Music.—Open 12 to 5 and 7 to 10. Admission to the whole, 1s.

Madame Tussaud's Historical Gallery, Baker Street. Admission, 1s.; extra rooms, 6d. Open from 11 a.m. till 10 p.m.

CRYSTAL PALACE.

Whit-Monday and following days, the most unusual combination. Besides the Thousand and One Holiday Attractions—CHANG, the Chinese Giant; his Wife, the Rebel Dwarf, &c.; ETHARDO, the Wonder of the Age, in his Spiral Ascension Feats; Mr. Nelson Lee, with a variety of entertainments; Dykwynkyn's Winking Joey, &c. &c.

One Shilling; Children half-price.—"The most wonderful shilling's worth in the world."

METROPOLITAN AND GREAT WESTERN RAILWAYS.

For further particulars of each train see hand-bills, which can be obtained at the Company's Offices and Stations.

J. GRIERSON, General Manager.

Paddington, May 7th.

GREAT NORTHERN RAILWAY.

Whitsuntide Holidays.—On SATURDAY, 19th May, CHEAP EXCURSION TRAINS will leave London (King's Cross Station).

Each train Returning on Wednesday, 23rd May.

Further particulars given in bills, which can be obtained at King's Cross, and other principal Stations; also at any of the Company's receiving offices in London.

Tickets may be obtained on Thursday, 17th, and Friday, 18th May, at King's Cross Station; and at the Bull and Mouth, Angel Street, St. Martin's-le-Grand; 32, Regent Circus; and 264, Holborn; also on the morning of the running of the trains, at King's Cross Station only.

SEYMOUR CLARKE, General Manager.

London, King's Cross Station, May, 1866.

GREAT EASTERN RAILWAY.

Whitsuntide Holidays.—FIRST and SECOND CLASS RETURN TICKETS issued on FRIDAY, May 18, and intervening days, will be available for the Return Journey on any day up to and including Saturday, May 26.

CHEAP EXCURSIONS.—On SATURDAY, 19th May, SPECIAL CHEAP EXCURSION TRAINS, will leave the Bishopsgate Station at 12.30 p.m. for Cambridge, Ely, Wisbeach, Lynn, Hunstanton, Wymondham, Norwich, Yarmouth, and Lowestoft, &c.

The Tickets will be available for the Return Journey by any train of corresponding class (except the Express) up to and including Saturday, 26th May.

A DAY AT THE SEA-SIDE.—On WHIT-MONDAY, 21st May, a SPECIAL EXCURSION TRAIN to HARWICH will leave the Bishopsgate Station at 8.30 a.m., returning from Harwich at 7 p.m.

On WHIT-MONDAY, and TUESDAY, SPECIAL EXCURSION TRAINS to BROXBOURNE and RYE HOUSE will run from the Bishopsgate Station, calling at Mile End and Stratford.

CHEAP EXCURSIONS to EPPING FOREST on WHIT-MONDAY, and TUESDAY, from Bishopsgate, Mile End, Fenchurch Street, and Stepney.

For full particulars see hand-bills and published time-books of the Company. By Order.

Superintendent's Office, London, May 1, 1866.

Working Men's Lord's-Day REST ASSOCIATION, 13, BEDFORD ROW, W.C.

Object:—To secure to the people their right to the rest of the Lord's-Day.

The ANNUAL MEETING of the Members and Friends will be held in the Large Room, Exeter Hall, on THURSDAY evening, the 17th of May, 1866. The Right Hon. Earl of Shaftesbury, K.G., has kindly consented to preside. The Hon. and Rev. B. W. Noel, Robert Baxter, Esq., Handel Cossham, Esq., Mr. Varley, Rev. W. Curling, Mr. S. Salmon, Mr. Kaye, and Mr. G. M. Murphy will (D.V.) address the meeting. Doors open at six; chair to be taken at seven o'clock.

Tickets may be obtained at the Office, 13, Bedford Row, W.C., by all Members and Friends.

All persons who desire that Sunday should be preserved as a day of holy rest, are invited to become Members of this Association. Annual subscription, 1s. and upwards.

CHARLES HILL, Sec. [2

The Operatives' House BUILDING COMPANY (LIMITED). Established to provide Improved Dwellings for the Working Classes.

Working Men's Societies are invited to communicate with the Secretary, at the Company's Office, 10, John Street, Adelphi, W.C., where Prospectuses may be had.

W. H. ROBINSON, Secretary. [15

Gathered from the Waters. For ages past there have been running from the various mines in Cornwall large streams of water. About the year 1857, it occurred to a miner to test one of the streams to see if it contained Copper: it was found very productive. Since that the works have been carried on successfully, and now 100 tons of Copper, or more, are gathered from the water every year. The works have undergone the examination of many experienced persons, and a Company has been formed to work the streams upon scientific principles. The Company seeks to acquire the right to work the whole of one large stream, and desires to secure some additional Capital for the purpose. The Company is formed upon the principle of Limited Liability. There is no risk whatever in carrying on the works, and the profit is known to be very large, and certain of making good Dividends for the Shareholders. The Shares are of £5 each, but only £1 is called—10s. on application, and 10s. on allotment. More than £3,600 is subscribed for privately, and early application should be made for the remaining Shares. Any one desiring a safe and profitable investment cannot do better than take Shares in this Company.

Fuller information can be obtained from the Secretary of the Copper Precipitating Company (Limited), Office, 8, Warnford Court, Throgmorton Street, London, E.C. [3

William Chambers, Heraldic Chaser and Embosser, 4, FOLEY STREET, PORTLAND PLACE, W.

The Original Chlorodyne, Invented by R. FREEMAN, Pharmaceutist, is allowed to be one of the greatest discoveries of the present century. It immediately relieves and cures Coughs, Colds, Consumption, Influenza, Bronchitis, Asthma, Whooping Cough, Cramp, Spasms, Gout, Diarrhœa, Dysentery, &c.

EARL RUSSELL communicated to the Royal College of Physicians and to Mr. Freeman that he had received information from Manilla that the only remedy of any use in Cholera was Chlorodyne.—*Lancet*, Dec. 31st, 1864. See *Times*, Nov. 14th, 1865.

Freeman's Original Chlorodyne.—The *Medical Times*, Jan. 13th, 1866, states—"It has an immense sale amongst the public, and is prescribed by scores of orthodox medical practitioners, and, of course, it would not be thus singularly popular did it not supply a want and fill a place."

Freeman's Original Chlorodyne engraved on the Government stamp outside every bottle. Sold by the Inventor and Manufacturer, R. FREEMAN, 70, Kennington Park Road, London, S., and most Chemists. In bottles, ¼ oz., 1s. 1½d.; 1½ oz., 2s. 9d.; 10 oz., 11s.; 20 oz., 20s.

Caution! Beware of spurious, deceptive, and dangerous imitations. Ask for Freeman's Original Chlorodyne, and see that you have none other. [25

Hall's "Lung Restorer" gives instant relief in Coughs, Asthma, Hoarseness, Sore Throat, &c. Mr. R. Brooke, Mirfield, near Leeds, writes, after suffering over ten years with an asthmatic cough, "Three 1s. 1½d. bottles cured me." Prepared by THOMAS HALL, Chemist, 6, Commercial Street (City side Great Eastern Terminus), London, and sold by all Chemists, in bottles, at 1s. 1½d., 2s. 9d., &c. [26

Note.—More than half a million pounds sterling have been advanced upon house property alone. [32

How to Purchase a House for Two Guineas per Month, with Immediate Possession, and No Rent to Pay. Apply at the office of the Birkbeck Building Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO PURCHASE A PLOT OF LAND for 5s. per Month, with Immediate Possession, either for Building or Gardening Purposes. Apply at the office of the Birkbeck Freehold Land Society, London Mechanics' Institution, 29, Southampton Buildings, Chancery Lane.—HOW TO INVEST YOUR MONEY WITH SAFETY, at £5 per Cent. Interest. Apply at the office of the Birkbeck Deposit Bank. All sums under £50 repayable upon demand. Current Accounts opened similar to ordinary Bankers. Cheque Books supplied. All cheques exempt from Stamp Duty.

Office Hours from Eleven till Five daily; on Saturdays from Eleven till Two, and on Monday evenings from Seven till Nine.

A small Pamphlet, containing full particulars, may be obtained Gratis, or sent Post Free, on application to
FRANCIS RAVENSCROFT, *Manager.* [33

The Planet Permanent Build- ING AND INVESTMENT SOCIETY, Established by Act of Parliament, July, 1848. Annual Income exceeds £200,000. Offices, 39, CITY ROAD, FINSBURY SQUARE, LONDON, E.C. The SEVENTEENTH ANNUAL MEETING was held September 12th, 1865. The Directors reported a large Augmentation of Business, and an Accumulation of Profits, which allowed a Bonus of £10 per cent., making the Dividend for the past year £15 per cent. The sum of £12,505, the Balance of Profit, had been carried forward for future division. The Assets of the Society had been increased during the year by £106,981. The Directors confidently reaffirm that—first, as a mode of investment at once secure and profitable; secondly, in the easy terms to Borrowers, and the facilities afforded for their transactions; thirdly, in the Equitable Adjustment of Repayment and Interest; fourthly, in the mode of Redemption; and, lastly, in the moderate fixed Law and other Charges, this Society stands alone. Shares, £50; Entrance Fee, 2s. 6d. per Share. Deposits to any amount—upon which no entrance fee is charged—may be made. Interest, £5 per cent., repayable on fourteen days' notice. Prospectuses and all further information may be had of EDMUND W. RICHARDSON, Secretary.

INDIAN BINA, OR GUITAR.

Indian Ornamentation.

A BINA, OR GUITAR.

THIS musical instrument is formed of ivory—it measures thirty-six inches in length. It is not a very ancient work; it is supposed that the artisan who constructed it was living at the close of the eighteenth century. However that may be, it is a very admirable specimen of Indian art.

Suppose a person of intelligence and taste, who had never seen any representation of the architecture and sculptures of Hindustan, had this guitar placed before him. At first, he would experience a feeling of surprise; but, after a careful examination, he would not, upon reflection, hesitate to say that the country in which so ingenious and skilful an art-workman could be found to execute such a work must be great in the arts, and that, doubtless, it has preserved traditions worthy of being studied by nations most advanced in civilisation. This opinion has long been held by travellers and scholars, who have examined the Indian sculptures of the caves of Ellora and

Elephanta, the ruins of Barolli, the temples of Adjmer and Komulmair, the tadj and tomb of Sha-Djaham, the mosques of Agra and Delhi, the palaces at Benares and Bidjapur, the ruins of Bhouvanesouara, the triumphal arch of Basnagar, the column at Chitor, and a hundred other examples of an original and powerful art. Between the *bina* represented in our engraving and any of the celebrated edifices of Bhuddist or Mussulman India, there is a closer connection than may appear at first sight; and, however widely different the proportions, it is not impossible to judge of the one by that of the others. It is remarked that the microscopic vignettes which Prudhon, an eminent French painter, made in his youth for merchants' bill-heads, when examined by a strong magnifying-glass, exhibit all the effect and excellences of the best engravings. Imagine the details of this Indian guitar enlarged in like manner, and we might believe that we had before us the elements of capitals, friezes, and other architectural details, such as would have been required if he who designed and carved this little musical instrument had not been also competent to construct a temple.

It appears to us that it will be useful to direct attention to this ornamentation, which exhibits such fine and delicate taste. We have arrived at an epoch in art, less systematic than formerly, which does not confine itself within circles traced by the ancient schools of art. To multiply the varied models of the excellent productions of all nations is, we think, to render a real service to industry itself, which tends, now-a-days, with fresh ardour, to abandon the vulgar or insignificant forms that prevailed at the beginning of the present century.

DESCRIPTION OF THE ENGRAVINGS.

Fig. 1. *The Sonorous Body of the Instrument.*—This is of an ovoid and inflated form. This portion of the instrument is divided into three perpendicular zones, bounded by two circles of carved ivory.

Fig. 2. *Top of the Instrument.*—This is of ivory, the pattern being in perforated work.

Fig. 3. *Details of the Top, or Sounding-board.*—Rama seated on his throne, his wife, Sita, on his right hand, and Hanouman, the god of apes, on his left. Beneath are sixteen birds entwined by their necks, whose heads and beaks unite and form a *rose* in the centre. This medallion, in the form of a heart, occupies the centre of the sounding-board, and is surrounded by two ornaments of similar form. The first, encircling the medallion, and painted on wood, is composed of a large garland of yellow flowers, interlaced, upon a red ground; the second, entirely of carved ivory, represents a running design. Below the pegs, in perforated work, Krischna is seen dancing, holding a garland of flowers in his hands.

Unknown Faces.

There is a splendid collection of these now to be seen in London, at the National Portrait Exhibition, lately opened at South Kensington, in what was formerly the refreshment rooms of the Great International Exhibition. We have spoken of these portraits before. Earl Derby was the author of this collection. It was his design, and his influence has enabled it to be carried out. There are upwards of 1,000 portraits gathered together for the instruction of the few and the gratification of the many.

We have heard these portraits called "Historical Faces." They are not all that, for the authenticity of the majority is undecided. Some of them are, undoubtedly, historical; nearly all of them are unknown to the public. The portraits date back to the days when Jan de Mabeuse, Hans Holbein, Antonio More, and other equally remote artists, first painted in England. English portraiture began with them. Since their time, their works have been buried on the walls of private mansions, court houses, and castles, utterly unknown and inaccessible to the public. Many of the persons here represented have long been household names in this country. For two or three centuries they have been conspicuous in our histories, but few had the means of conceiving how they dressed and looked. No engraving, where such have been diffused abroad, could equal the life-like presentment the painter renders who saw them. The colour, the stature, in most cases, are given in the portrait on canvas and panel; and the visitor to the exhibition sees the actual lineaments, as those who owned them looked upon them and approved them when transferred by the painter's art hundreds of years ago.

The beauty or defect of these paintings, the rise and growth of this great art of portraiture, the styles of the different masters, the authenticity of their works, the pedigrees of the different panels—all these are matters of art, and concern the connoisseur. The general public will know little of these nice points, and will go to gaze on these unknown faces, to see what manner of people filled the world, and were the memorable actors in our national history.

Many will be filled with surprise at what they will behold. None will be insensible to the wondrous art with which a great number are painted. They will admire without knowing why, and, nevertheless, admire rightly. A work of genius makes itself known in ways of its own, and conquers the attention of the learned and unlearned alike. But surprise will be felt at the unexpected personal appearance of many of the portraits. Others, again, answer entirely popular expectation. Philip II., of Spain, is disagreeable enough, but yet has not the thin-lipped, dyspeptic, cruel mouth of his wife, Queen Mary, which is in every portrait. Those who know the history of Queen Elizabeth and her times, will not be surprised to see her painted with a nude Venus sitting on a bench before her in her court; but few would, in these days, expect that such a picture would have been attempted or permitted by her. No one, however, can wonder that Wickliffe gave trouble in his day, who looks on his sharp, penetrating, polemical face. John of Gaunt answers exactly to his iron name. Chaucer's portrait has been preserved for more than three hundred years at Llanshaw Court, Gloucester. The profile of the Earl of Douglas is well worth looking at. Warwick, the "King maker," has a plebeian, but resolute air. Sir William Butts and Lady Butts, painted by Hans Holbein, are the two finest specimens of his pencil in the whole exhibition. There are two Will Somers, the jester of Henry VIII.—the one looking through bars has a face to make a prison merry; the other would make a bridal party feel like a funeral procession, if they met him. There are three Blakes—one a sour-looking Dutch Van Tromp, one a Spanish poet, in appearance elegant and fiery, the other a massive Antinous. It is impossible they can all be the portrait of our brave old admiral. There never was a neck of any being, except an ostrich or a giraffe, so long as Sir Thomas Wyatt's. Burghley looks heavy, rather than wise. It is said, "No man ever was so wise as Burghley looked." Sir John Harrington wears the graceful, romantic air of the new world maker he was. Lord Arundel, of Wardour, has a head full of force and nature, such as Vandyck knew so well how to paint. Sir William Drummond, of Hawthornden, has a sonnet in his face. The head of Villiers, Duke of Buckingham, painted after his assassination by Felton, is remarkable for largeness, dignity, and intellect. The owner of such a face ought to have led a better life. Colonel Hacker, who had the custody of Charles I., looks a man into whose hands no one would wish to get. There are two Prynnes, the brave penman—the one bilious, and conscious of the loss of his ears; the other as he deserved to look, when he had written his enemies. There are two Andrew Marvels—one full of refinement and privation; the other a sleek knave, who looks as though he wanted to be bribed. Inigo Jones looks as distinguished as his works. The famous Harvey resembles Carlyle; and Cowley, Professor Kingsley. Simon the Medallist has the head of a Napier, the nose and gaze of an eagle. Major-General Disbrowe, whom Cromwell made Chancellor of Ireland, has the face of a girl, though he had the spring and fury of a tiger. George Fox is handsome as a country milkmaid, and as ruddy, and sentimental to idiocy. You wonder how a spirit so untamable, constant, and brave, dwelt in a form so sweet and rapturous. The statuesque beauty of Jane Shore, authentic or unauthentic, is there. Sir Peter Lely's Nell Gwynn, cold and chaste; the handsome and intrepid Charlotte de la Tremouille, Countess of Derby, and many examples of loveliness and lasciviousness are represented. On these alluring canvases are faces full of dignity and intellect, of grace and strength, of honourable age and nobler character. English life, heroism, and thought, of three centuries ago, look down upon the visitor from these walls.

Chief and multitudinous of all the works of the great painters present are those of Hans Holbein, the dashing, daring, indefatigable portraitist, of whom Henry VIII., his great patron, truly said, when an outraged nobleman demanded his life—"Out of seven peasants I could make seven lords; but out of seven lords I could not make one Holbein." He is the greatest master, as he was the father, of our portrait painters. His sure hand never failed him. There is mastery and confidence in all his touches. He painted living people, and they live still on his canvas. His queens on the way to the block, and the king who sent them there; the nobleman or the jester; the philosopher and the fool; their expression, their complexion, their attire, are all faithfully shown. Nothing escaped him, and he bestowed on every detail care and skill.

Other painters, whose works are included in this exhibition, are deserving, and will be sure to receive, study and appreciation; but were the works of Holbein alone there, the public could not fail to experience admiration and delight from the sight of so many examples of his now brought together. What a great writer has said of the Academy of Athens may be applied to an exhibition containing the great works of Holbein: "Many are the beauties of the place—the groves and the statues, and the temple, and the stream of the Cephissus flowing by; but the attention of the student is just now arrested by one object: it is the very presence of Plato. He does not hear a word that he says; he does not care to hear; he asks neither for discourse nor disputation; what he sees is a whole, complete in itself, not to be increased by additions, and greater than anything else. It will be a point in the history of his life, a stay for his mind to rest on. A Spaniard is said to have travelled to Italy, simply to see Livy; he had his fill of gazing, and then went back again home. Had our young stranger got nothing by his voyage but the sight of Plato; had he entered no lecture-room to hear, no gymnasium to converse, he had got some measure of education, and something to tell of to his grandchildren." The designer of this exhibition may have had some such thought in his mind when he proposed to open the concealed world of portraits to the English public; and certainly the works of Holbein alone would go far to realise such an expectation.

THE POETRY OF THE FUTURE.

The poetry of the coming age must come from the working classes. In the upper ranks, poetry, so far at least as it represents their life, has long been worn out, sickly, and sentimental. Its manhood is effete. Feudal aristocracy, with its associations, the castle and the tournament, has passed away. Its last healthy tones came from the harp of Scott. Byron sang its funeral dirge. But tenderness, and heroism, and endurance still want their voice, and it must come from the classes whose observation is at first hand, and who speak fresh from Nature's heart. What has poetry to do with the working classes? Men of work! we want our poetry from you—from men who will dare to live a brave and true life; not like poor Burns, who was fevered with flattery, manful as he was, and dazzled by the vulgar splendours of the life of the great, which he despised and still longed for; but rather like Ebenezer Elliot, author of the "Corn Law Rhymes." Our soldier ancestors told you the significance of high devotion and loyalty which lay beneath the smoke of battle-fields. Now rise and tell us the living meaning there may be in the smoke of manufactories, and the heroism of perseverance, and the poetry of invention, and the patience of uncomplaining resignation.—*The Rev. F. W. Robertson.*

Increase of Coal Traffic on Railways.—Seventeen years ago the entire coal traffic on the Midland Railway did not exceed a quarter of a million tons a year: now it is at the rate of six and a half millions of tons.

Steam Omnibuses.—Steam omnibuses are, it is said, to be established in Paris. The company propose to run from the Champs de Mars to the Bastile, making six halts. The first is to be at the Champs Elysées, the second at the Madeleine, the third near the new opera on the Boulevard des Capucines, the fourth near the theatre of the Gymnase, the fifth at the Porte St. Martin, and the sixth at the Château d'Eau. The omnibuses drawn by horses take an hour and twenty minutes to perform the distance; the steam company undertake to accomplish it in forty-five minutes, including stoppages.

The Moral and Social Aspects of the Temperance Movement.

Morality, in its most comprehensive extent, includes the performance of all our duties; and these have respect to the Creator, to ourselves, and to other beings, especially those of our own species. It is usual, however, to distinguish between religion (duties to God) and morals; not because religion can be practically separated from other branches of morality, but because the duties men owe to themselves and others may be inculcated, and in a measure performed, without immediate regard to the authority and favour of the Most High. Morality, in this more limited sense, involves, as to oneself, (1) the duty of self-acquaintance, (2) the duty of self-restraint, and (3) the duty of self-improvement. As to others, morality involves (1) the duty of abstinence from injuries, (2) the duty of showing kindness, (3) the duty of mutual protection and assistance; all of which may be summed up in the golden rule of "doing to others as we wish them to do to us." All avoidable ignorance is forbidden by the first and third duties of personal morality, and all vice by the second. But vice is a general name for indulgence of the animal nature at the expense of the mind and heart. Some indulgences are immoral in themselves; but gratifications commonly become immoral by their excess. Physical propensities, when they grow so strong as to impel to action irrespective of consequences, and of the moral sense, are vicious "lusts of the flesh;" and, in proportion as they are obeyed, they degrade their subject to a bestial condition.

Over against this animalism, or intemperance, stands continence, or temperance; and all moral codes, whether philosophical or religious, have magnified the radical and supreme value of self-restraint, both as a means of bodily health and mental discipline, and as a basis for usefulness in life. Hence by some ancient sages temperance was considered, not so much a single virtue, as a preservative of all the virtues. The bearing of these remarks on the Temperance Movement of modern times will be perceived, when we place alongside of them the indisputable facts—

First, that intoxicating liquors, in whatever age or country they have been used, have generated a form of animalism distinct from every other—one peculiarly fascinating and peculiarly degrading; and,

Secondly, that their effect upon animalism in general has been of a singularly exciting and aggravating character.

The phenomena of intoxication are not possible without the use of intoxicating liquors—a fact which is overlooked by those who confound *this* intemperance with other sensualities. These phenomena are of very great variety, but all indicate the action of special *toxicum*, or poison, from the faintest flush to the wildest delirium. Popularly speaking, "intoxication" designates only the most striking symptoms produced by the *toxicum;* but scientifically, a relationship between all the symptoms must be acknowledged. Hence the love of drink is not confined to habitual drunkards, and the characteristic sensualism of the bottle may be carried to a lamentable extent without one act of ordinary drunkenness ever being committed.

Not less remarkably do alcoholic liquors operate on the whole animal nature, by educing and inflaming its worst propensities. Concurrently, if not in consequence, the moral perceptions and powers are weakened; and the will (the capacity of free action) is obviously affected, while self-confidence is rendered morbid and extravagant. This is why the vice of drinking is the mother or nurse of almost all vices, and why it is the unequalled generator and fomenter of crimes of violence. Crimes against property are also largely due to it, from the loss of means and character it produces, so making men desperate and ripe for evil.

Admitting all this, however—and it can scarcely be denied by the thoughtful inquirer—the Temperance Movement has been opposed as an extreme method of counteracting the sensuality caused or stimulated by intoxicating liquors. The moderate use of such beverages, it is held, would prevent the moral and social evils complained of, and is the best exemplification of that temperance of which Nature largely consists. It is even held by some who take this view that abstinence is distinct from temperance, as an appetite or desire for drink cannot be restrained where it is not permitted to exist. To this reasoning it is replied, that the moderation in drinking thus extolled can never become universal, or even general, while strong liquors are used as beverages, considering (1) their inherent tendency to stimulate and not to satisfy desire, and (2) the tendency of mankind to seek physical enjoyment at the expense of their highest interests. It is also replied that this *beau-ideal* moderation is indefinable, and that what is deemed by the drinker a moderate use of intoxicants will seldom be found free from some injurious effects. Further, it is answered that the true principle of temperance is self-restraint *from* all sensualising agents, and that restraint in their use, though very commendable, is an inferior measure of the temperance required, and is always attended with a degree of danger which is morally unquestionable, unless incurred in the performance of a clear moral obligation.

The Temperance advocate also lays great stress, and very advisedly so, upon the class of moral duties having regard to others; and he endeavours to show that total abstinence is superior to the most vigilant moderation, in the safe example it offers and the encouragement it presents to the victims of drink to practise that self-restraint of total abstinence which, for them, is universally allowed to be essential. Further, the duties of mutual protection and benefit are said to be illustrated by the influence of the total abstainer in discharging his responsibilities to the family and the State. Over and above all reasoning and theory, the supporters of the Temperance Movement point to its actual results in the reformation of drunkards; the preservation of the sober; the better training of the young; the greater industry, good order, and respectability of its members; and the transparent improvement of every kind made evident in the moral and social state of large numbers of persons, whenever brought under its direct control. To drinking, it is said, the vice of prostitution owes most of its magnitude and virulence; by drinking, all other public and private debaucheries are sustained in their ghastly luxuriance; from drinking, as from a fountain, flow the crimes that make society blind, and cover it with shame. It is therefore inferred that if drinking were abolished—if by general consent or fashion the habit were to become obsolete—all the evils thus provoked would cease, and with their removal so much immorality and suffering would disappear, while all extant appliances for the elevation of the world would operate with augmented force, and achieve a more assured success.

THE PARIS EXHIBITION OF 1867.

This exhibition bids fair to be the most extensive yet erected in the whole world. The talk is already of the wonders to be exhibited in the park and gardens, which outshine by far all those beheld within the palace. The various habitations of mankind in the different quarters of the globe are to be constructed therein. A missionary's hut, such as rises on the shores of the African rivers, is to be sent by England. The imperial tent belonging to the gala service of the Emperor of Morocco, and the tent inhabited by the Bey of Tunis when on a journey, will be spread side by side with a merchant's house from Teheran, and an opium factory from the same place. Egypt sends the palace of her Viceroy and an artificial hatching-oven. From Turkey comes a mosque, a Maronite dwelling, and a sarcophagus. Italy has already conveyed the collection of the tools and apparatus used in boring the tunnel beneath Mont Cenis. The Pontifical Government has bespoken a superb tent, beneath which will be exhibited all the antiquities discovered of late years in Rome and its environs. In the Japanese garden will be seen a native kiosk, a bamboo hut, and the hunting-lodge of Prince Stayemy. As to China, the patient and enterprising, she will despatch a Chinese coffee-shop and bazaars, and in the middle of the Chinese garden will rise to the clouds one of those porcelain towers in whose existence nobody believes save those who have beheld them. The kingdom of Siam will be represented by a Siamese temple, and a dwelling-house belonging to one of the nineteen *eldest* sons of the king. All these dwellings will be surrounded with the plants and vegetation peculiar to the clime whence they have been brought. Some idea of procuring, as far as possible, specimens of the animal life belonging to the same region has been suggested; but difficulties arise in the way of feeding and keeping them within bounds, which threaten to interfere with the project. The greater portion of the park, as well as the building, will of course be consecrated to France. In the midst of an immense garden, containing living specimens of the natural productions of the country, will be dug an extensive lake, to be fed by an artificial river, whose waters will escape by a cascade falling from rocks of considerable height. In the middle of the lake will rise a lighthouse, containing a beacon, which, by its electric light, will render the night as pleasant as the day through the horizon of Paris during the whole time of the exhibition.

*The Language of the Workshop.**

There is often a misconception with regard to the two words *carbuncle* and *cabochon*, and sometimes one is taken for the other, whereas the confusion arises from the mistaking a stone for the manner of cutting it. The primary word, *caboche*, from the French, means a round-headed nail, a rounded lump, a head, a nob; and, consequently, a stone cut *cabochon* is one smoothed round and polished without being regularly cut. In this shape we obtain the garnets from India, and which we call *carbuncles*. It is evident that both words mean much the same thing, only that the word *carbuncle* has come to be used for garnets cut *cabochon*, while *cabochon* means only the manner of cutting any precious stone with a smooth, rounded surface. The English lapidaries use the word "tallow-drop" to describe the manner of cutting cabochon, but the roundness given to the stone is not the same in both cases, the former word indicating a greater flatness on the top. In reality, we go back to the rudest and earliest method of stone-cutting in the carbuncle or cabochon cut stone, which could have been only the gem as plucked from the matrix, and polished on its best surface; but science has so modified the method to advantage, that it is now the most effective in developing the beauties of some stones.

The word *lemel* (sometimes written *lemaille*) has the same meaning in most European languages—viz., the filings and miscellaneous accumulations in the process of working. In German and English it has no elementary sense, and is, no doubt, derived from the French *mêler*, to mix, *lemèle*, or *le-mèlé*, being a mixture. The Germans have a word which subdivides this mixture very neatly, and which may be rendered into English as *goldish*—that is to say, it describes the *lemel* of the diamond jeweller, in which silver becomes mixed with gold in so large a proportion as to render the whole unfit for future working without being parted and refined. This is not *lemel* in the usual sense of the word; that is to say, it cannot be reduced in the skittle-pot so as to be fit for immediate use; and as a name is really required to distinguish it, *goldish* perfectly answers the purpose.

It is instructive to observe the difference of terms in which masters and men—to use the old-fashioned words—are spoken of or addressed at different times, and in different places. In England the word *master* has long given way to other titles less indicative of superiority, as *employer;* and although the honourable designation of *workman* still holds its own—as it probably ever will, on account of its implied proficiency in practical knowledge—the expression by which an inferiority is suggested between the one who buys labour and the one who sells it are becoming gradually discarded. Even *journeyman* is out of date, and *operative* thrown aside. Many workmen would think themselves degraded by being called a "hand," and the term a "man," in its restricted sense of a mechanical servant, is not generally relished. Distinctive titles are indeed avoided, and the workman takes his place under the general phrase of the "employed," while the employer, ceasing to be a "master," is dubbed, half in jest and half in earnest, the "guv'nor." So the spirit of independence asserts itself.

In Germany there is a distinction between North and South. The North calls the employer the *principal*, which requires no translation, the South the *herr*, lord and master. The workman, once the *knecht* or hind, became in process of time the *geselle* or journeyman, and is now the *gehülfe*, the assistant. Sometimes there is a kind of compromise between the words *herr* and *principal;* and the employer, in a sort of sly earnestness, becomes the *alter*, the old one. The French jeweller designates his master his *patron*, and the foreman his *chef d'atelier;* while the more demo-

* Concluded from page 314.

cratic American delights in individualising his employer as the "boss." In some French trades, however, the spirit of antagonism makes itself evident in the bitter term bestowed upon the *patron*; and the tailors, with others, designate him as the *grife*, or Old Scratch—an expression more significant than polite.

From masters, coming to apprentices, it is not surprising that the primary idea expressed in the words used with regard to the latter is identical in most languages, and indicative of a state of pupilage. The English word apprentice does not at first sight appear to express so much, and for its real signification we must turn to the French verb *apprendre*, to learn. From this comes *apprenti*, a learner, and so our own word apprentice. The Germans use the word which, perhaps, we should have adopted, and which, indeed, we have adopted in almost every other case. From *lehrnen*, to learn, comes *lehrlinge*, a learner, an apprentice. To be "*in der Lehre*" is with them to be in that honourable state of dependence—in apprenticeship.

*The Swedish Calculating Machine.**

In our previous article, we gave a sketch of the history of calculating machines in general, and of the Swedish invention in particular. We shall now attempt to describe the mechanism by which the Messrs. Scheutz have accomplished their purpose.

Like its two English predecessors, the Swedish machine is strictly a Difference Engine. It is composed of three distinct parts: (1) the calculating apparatus, consisting of the vertical spindles and rows of figure-wheels observable in the entire front of our last week's illustration; (2) the printing apparatus, which lies at the top and back part of the machine, and consists of the horizontal spindles with their corresponding toothed wheels, pulleys, racks, and type-wheels, visible at the top of the left hand of the illustration; and (3) the index, or enumerator, which lies quite behind out of view, and indicates the number of results completed.

There are five horizontal rows of calculating-wheels: on the first row appears the result of every separate calculation, and it is, therefore, the only part placed in direct communication with the printing mechanism; the second row corresponds with the first order of differences; and the third, fourth, and fifth rows with the second, third, and fourth orders of differences. The calculating-wheels are silver-coated rings or hollow cylinders, each about two inches in diameter and about three-quarters of an inch high, and they run in bearings on a shelf, which admits of their being turned with ease either by hand or by the movements of the machine. Round the outer surface of these wheels the figures from 0 to 9 are engraved at regular intervals, and each wheel is supported on its shelf in such a way as that half its surface is above and half below the shelf; on the upper half the figures are engraved, and the lower half is divided into teeth, corresponding in number with the figures above. To "feed" the machine—if we may use the expression—it is requisite that the wheels be so set by hand as that the figures composing the differences and first term of the series to be calculated are all ranged "eyes front," in drill order, on the centre of each wheel. Thus, referring to the example which we gave in our previous article of the mode of calculating a table of cubes, we should "set" the wheels by turning them by hand until the following figures showed in the centre front of the wheels on their respective rows:—

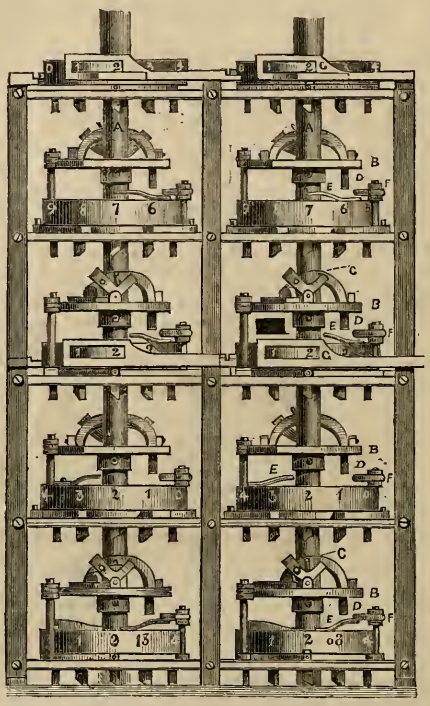
First row	1	= First term of Series.
Second row	7	$= \delta^1$
Third row	12	$= \delta^2$
Fourth row	6	$= \delta^3$
Fifth row	0	$= \delta^4$

These numbers would be set by beginning on the eighth wheel of each row,—the printing apparatus only extending to eight figures—and setting from right to left when more than one figure is required; all the other wheels would be set to zero.

Now, assuming the figures given above to be set for the calculation of a table of cubes, each resulting cube would be obtained by two opposite motions of the mechanism, or, as it is technically called, by a complete "stroke," which is divided into two equal parts. The first "half-stroke" prints the number on the first row, and adds the numbers on the third row to those on the second row, and the numbers on the fifth row to those on the fourth row, simultaneously: this is half the operation; the second "half-stroke" adds the new numbers on the fourth row to those on the third row, and simultaneously the new numbers on the second row to those on the first row, which completes the operation by giving the second cube, to be printed at the succeeding "half-stroke."

Let us now endeavour to explain how the machine executes its work.

By an adaptation of the old "mangle-wheel" principle, the handle is turned continuously in one direction, whilst a backward and forward movement of the mechanism is the result. Working on the same axis with the "mangle-wheel" (marked A in last week's illustration), is a toothed segment, which is periodically brought into action by a stud projecting from the diameter of the mangle-wheel, and which, as it rotates, bears against the segment, and carries it on until the reverse action of the mangle-wheel takes the stud off its bearing and brings it round to the other side of the segment. This segment acts on a rack which is geared to pinions affixed to the tops of each of the fifteen vertical spindles, and causes them to make a complete revolution, first in one direction and then in another. These spindles (marked A in the accompanying section) pass down through the open diameters of each of the rows of calculating-wheels, but without touching them; so that, if there were no other provision, the revolution of the spindles would have no effect whatever upon the wheels. But midway between each wheel and the one immediately underneath it, there is a small stage, B, attached to the spindle carrying a finger, C, working on a trap, from which is projected downwards a lever, D, reaching nearly to the top of the wheel below; so that as the spindle goes round it carries this sort of fishing apparatus, or grapnel, with it. Then from the top of the wheel below there projects upwards a small catch, E, which is balanced at its centre, and as the spindle revolves the grapnel meets with an obstruction in the catch, the effect of which contact is to raise the finger on the trap, and cause it to take hold of a notch in the under part of the wheel above, and carry that wheel round until the grapnel has passed over the obstruction, when the trap falls and the finger drops from its hold on the wheel above. It will be noticed that, with regard to the bottom row of wheels, no provision is made such as we have just described, and, therefore, whatever number is set on those wheels remains unchanged throughout the operation. In the accompanying section, the bottom wheels show 0 as the set number, and as nothing is to be added from that row to the row above, the little catch is brought under a fixed arm, F, which depresses the catch below the course of the grapnel; and thus, as the value of the bottom row is zero, the row next above it will remain unaltered until a fresh setting is made. In this way the powers of the machine can be curtailed by reducing the numbers on either one, two, or three of the rows of wheels to zero; and if every wheel in the machine were set to zero, the spindles would revolve *ad infinitum* without changing the position of the wheels.



SECTION OF CALCULATING MACHINE.

There is yet another most ingenious contrivance connected with the calculating apparatus, which we must try to convey some notion of. Supposing the machine has to add, say, a row of eights and a row of fours together, some means are wanted for carrying the tens as one would do in ordinary practice; thus—

```
 88888
 44444
 ------
133332
```

This contingency is thus provided for:—Each figure-wheel has a small stud placed on its engraved surface in such a position as that, when the result of an addition exceeds unity, the revolution of the wheel causes the stud to strike against one end of a bent horizontal lever, G, of which the other end is placed close in front of the next preceding wheel, and throws it out beyond its rank. Then, by means of an endless chain geared to the mangle-wheel, an upright post works in a groove up and down in front of the figure-wheels. This moving post (marked B in last week's illustration)—the "traveller," as it is called—is fitted with arms working on pivots, and these arms grope along the line of march for any obstructing levers which may have been thrown forward during the calculation as an indication that a carriage needs to be made. Whenever the arm of the "traveller" comes in contact with a projected lever, the arm is raised, so as to bring its latch against a tooth of the figure-wheel in front of which it is passing, and carry that wheel round one place. This process of carrying is independent, and comes into force between the intervals of calculation. The printing apparatus is at the back part of the machine, and is brought into play by means of weights and pulleys acting upon a series of horizontal spindles connected in the front with the calculating-wheels, and at the back with a set of racks geared to a corresponding set of type-wheels, E. Whilst the calculation is being performed, all the type-racks are kept fixed by a bar, F; but as soon as the line of figures represented on the top row of calculating-wheels is ready for printing, the bar is withdrawn, and the racks are left to the action of their weights, which is regulated by the motion of a snail, D, similar to that of a common clock. The snail in this instance drops down on to a notched spiral cam, C, attached to the top row of calculating-wheels, and the position of the type-racks, therefore, depends upon the corresponding positions of the snail and the spiral cam. When the type-racks are thus regulated, the type-wheels will have ranged themselves in proper order for stamping the result of the calculation upon a plastic surface fixed in the printing-rack, which, by a simple contrivance, is passed along gradually underneath the type, and by the action of an eccentric is raised up to receive the impression, and then pushed forward so as to leave a clear space for the next line of figures. The material used for receiving the impression of the steel dies is *papier maché*, in slips of about eight inches long by two inches broad, and of moderate thickness, the surface being rubbed over with

We give a specimen of the work of the machine, which was calculated and stereotyped on the *papier maché* in our presence, and from the matrix which was given us we have had the actual figures (which are in the significant characters of the machine) stereotyped for the gratification of our readers, who will thus possess a tangible proof of the realisation of one of the most ingenious ideas which ever issued from the brain of man.

We have thus endeavoured—very imperfectly, we are assured—to describe some of the salient features of the Swedish Calculating Machine. We do not pretend to have written such an account as would satisfy scientific men; but have, rather, sought to make our remarks chiefly intelligible to our own constituents, many of whom are daily employed amidst the wonders of machinery in our great factories, workshops, and mills. On their behalf we are much indebted to the Registrar-General for giving us the opportunity of making them acquainted with one of the most novel and beautiful pieces of mechanism we have ever seen. Regarded simply as a piece of work in metal, it reflects the very highest credit upon Messrs. Donkin, the well-known London engineers, in whose establishment the machine was made. The machine consists of more than 4,000 separate pieces, and weighs 10 cwt.

*Lessons in Mechanics.**

BY THE REV. PROFESSOR HAUGHTON, M.D., F.R.S., FELLOW OF TRINITY COLLEGE, DUBLIN.

If we estimate the work done by horses and other animals as weights lifted through a height, we obtain the following results:—

WORK DONE BY ANIMALS.

	HOURS OF LABOUR.	WORK DONE.
1. Horse yoked to wagon (walking)	8	5845 ft.-tns
2. Horse yoked to carriage (trotting)	4½	5052 ,,
3. Horse yoked to whim (walking)	8	3719 ,,
4. Horse employed at pumps (Portora)	8	3425 ,,
5. Horse yoked to whim (trotting)	4½	3131 ,,
6. Ox yoked to a whim	8	3340 ,,
7. Mule yoked to a whim	8	2505 ,,
8. Ass yoked to a whim	8	1039 ,,
9. Steam horse of English Engineers	8	7071 ,,
10. Steam horse of French Engineers	8	6959 ,,

The steam horse was a unit of force invented by Mr. Watt, from observations made on the work done by brewers' horses employed in turning machinery by means of a horse whim.

The steam horse of Watt is equivalent to 33,000 lbs. lifted through one foot in one minute, and is always employed in calculating the horse power of machines. It gives a result of work done daily by the horse, that must be regarded as a maximum, although well-fed and well-treated horses can be made to produce this large amount of daily work. For example, in the "haulage" of materials on a tramway, the strain of the traces when the wagons are properly loaded should be 150 lbs., and it is found that at this description of work, a good horse can labour at the rate of two and a-half miles per hour, for eight hours daily. This gives us for the work done, 150 lbs. lifted through twenty miles, which, when converted into foot-tons, gives—

$$\text{Work done per day by a horse in railway haulage} \left\} \frac{150 \times 20 \times 5{,}280}{2{,}240} = 7{,}071 \text{ ft.-tons.} \right.$$

This result is identical with the work attributed to the steam horse of Watt.

If we take the mean of the steam horse, the horse yoked to a wagon, and to a whim, we find the daily work done to be 5,545 ft.-tons. In doing this work, the horse is obliged to walk about twenty miles, and of course has to carry his own weight in addition; assuming the average weight at 1,250 lbs., and the coefficient of traction at 1-25th, this is equivalent to—

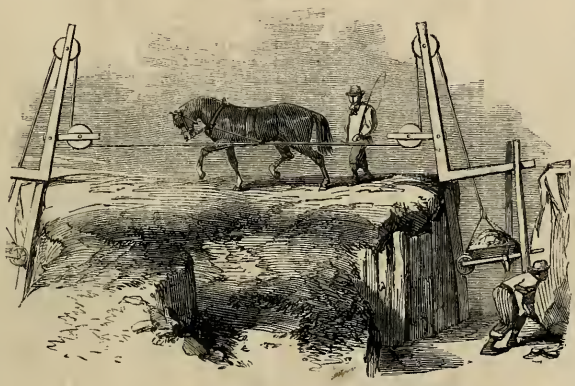
$$\text{Work done by horse in walking 20 miles} \left\} \frac{1{,}250 \times 20 \times 5{,}280}{25 \times 2{,}240} = 2{,}356 \text{ ft.-tons.} \right.$$

The total work done by an average horse in one day is therefore—

Useful work	5,545 ft.-tons.
Fatigue work	2,356 ,,
Total	7,901 ft.-tons

We have already found (see second table, page 293) that a man is capable, on an average, of performing 320 ft.-tons in one day, which is only $\frac{1}{25}$ part of the work done by a horse. The price of a man and horse per day is only double that of the man alone, and as the horse can do twenty-five times the work of the man, there is a great economy in the employment of animals in every description of labour to which they are suited.

The accompanying illustration shows a contrivance called a "horse run," invented by Mr. Matthews, and for which he obtained an honorary gold medal from the Society of Arts. It is intended to assist shovellers in raising earth from one level of a railway cutting to another. The weights of the wheelbarrows counterpoise each other, their wheels run upon highly-inclined planks, and the handles are guided by uprights. The weight is lifted by the horse, and on reaching the higher level the loaded barrow is ready for the navvy, whose duty it is to wheel it away and empty it. The remainder of the diagram explains itself.



THE HORSE RUN.

* Continued from page 293.

*Window Plants and their Culture.**

For window decoration during the early spring months, there are no plants so well adapted as bulbs of various kinds and Chinese primroses. I have already given the necessary culture of the latter, and I shall now describe the suitable treatment of the different bulbs grown in pots and glasses.

Foremost comes the hyacinth, which for its beauty of form and colour, pleasant perfume, and the ease with which it may be grown, is a great favourite. The most suitable method of growing this lovely flower is in pots; and there are pots manufactured specially for them, which are deeper in proportion to their width than usual. A five-inch pot will be quite large enough for one bulb, and a seven or eight-inch pot will do for three bulbs planted together. Hyacinths may be planted from the time the bulbs arrive (early in September) until December and January. The soil should be rich, and have a liberal mixture of coarse sand. The drainage must be good. Fill in the prepared soil, pressing it slightly down; place the bulb so that its top is on a level with the rim of the pot, and then, putting in some more earth, press it firmly round the neck of the bulb, which will prevent it from rising out of its place when the roots begin to grow. After the bulbs are planted, put them in a dark place for a fortnight or three weeks before exposing them to the light. This treatment will cause the roots to grow before the leaves. After the bulb begins to grow, never let the soil get quite dry, and turn the pot round in the window daily, so that it may not grow all to one side.

In glasses the culture of the hyacinth is very simple. Use rain-water instead of spring. Put a piece or two of charcoal in the bottom of the glass, and as long as the water remains sweet forbear changing it. As soon as the roots begin to grow, take away a little of the water, so that it may be half an inch from the base of the bulb. As to the choice of bulbs, price, &c., the trade lists which are published every autumn by the London and provincial seedsmen will furnish every particular necessary.

Dwarf tulips, the Duc Van Thol in various colours, the double Tournesol, and some others, make a very gay addition to window-plants, when planted three or five of each in a five or six-inch pot. They also require a rich, sandy soil, and plenty of light and air, so that the colours may be bright, and the stalks short and firm.

Many varieties of narcissus—the double white Roman and the bulbocodium, or hoop-petticoat—grow nicely in pots. They require just the same treatment as the above. Then crocuses, snowdrops, anemones, ranunculus, scillas, and a number of other bulbous and tuberous rooted plants, are all very well suited for the enlivenment of the window when other flowers are scarce. All require pretty much the same treatment. But it is essential in planting these roots to have the soil sandy and rich, and to keep them in darkness for some time after they are put down, so that the roots may have some time to grow.

A large, flat basket, or a china dish, filled with damp sand, looks beautiful when planted with hyacinths in the middle, round these the dwarf tulips, and a border round the whole of snowdrops, crocuses, and the pretty blue scillas. The surface of the sand must be covered with moss, and every week or ten days the whole quietly immersed in a pan of water, and let drain for a few minutes before being restored to its place. It will be necessary to place a few lumps of charcoal in the bottom of the sand. Such an arrangement as this will give a succession of gay and beautiful flowers for weeks together. The separate bulbs in pots will be much benefited by an occasional cleaning of their leaves with a soft brush and

* Concluded from page 315.

lukewarm water. If the stems of the hyacinths should be too short, a paper funnel placed over them will be found useful to draw them up; but the fault with beginners is generally the other way, and the stems become long and weak, requiring support. The way to avoid this is by giving plenty of air and light, and keeping the plants near the glass, so that they need not stretch to get to the light. Keep the bright sunlight off when in blossom, and they will last in full beauty for many days.
